

PowerFlex 750-Series AC Drives

User Manual

Important User Information

Solid state equipment has operational characteristics differing from those of electromechanical equipment. *Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls* (Publication SGI-1.1 available from your local Rockwell Automation sales office or online at <http://www.rockwellautomation.com/literature>) describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc. is prohibited.

Throughout this manual, when necessary we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

Important: Identifies information that is critical for successful application and understanding of the product.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequences.

Shock Hazard labels may be located on or inside the equipment (e.g., drive or motor) to alert people that dangerous voltage may be present.

Burn Hazard labels may be located on or inside the equipment (e.g., drive or motor) to alert people that surfaces may be at dangerous temperatures.

PowerFlex, DriveExplorer, DriveExecutive, DPI, and SCANport are either trademarks or registered trademarks of Rockwell Automation, Inc.

Summary of Changes

This information below summarizes the changes to the PowerFlex 750-Series AC Drives User Manual, publication 750-UM001 since the last release.

Manual Updates

Change	Page(s)
Catalog Number Explanation updated	P-6
Lifting instructions for Frame 6 and 7 IP54, NEMA/UL Type 12 enclosures added	1-2 , 1-4
Acceptable Surrounding Air Temperature for Frame 6 and 7 IP54, NEMA/UL Type 12 Stand-alone/Wall Mount drives added	1-7
Common Bus Power Wiring section added	1-18 ... 1-20
PowerFlex 753 I/O Terminal Block Specifications added	1-28
PowerFlex 753 Control Module details added	1-31 , 1-32 , 1-34 , 1-35
PowerFlex 753 Main Control Board I/O wiring examples added	1-38
Auxiliary Power Supply installation details for PowerFlex 753 added	1-46
RF Emission Compliance and Installation Requirements table updated	1-53
PowerFlex 753 control block diagrams added	Appendix B

Change			Page(s)

Index		

Overview

The purpose of this manual is to provide you with the basic information needed to install, start-up and troubleshoot PowerFlex® 750-Series Adjustable Frequency AC Drives.

For information on ...	See page...
Who Should Use This Manual	P-1
What Is Not In This Manual	P-1
Recommended Documentation	P-1
Manual Conventions	P-3
Drive Frame Sizes	P-3
General Precautions	P-4
Catalog Number Explanation	P-6

Who Should Use This Manual

This manual is intended for qualified personnel. You must be able to program and operate Adjustable Frequency AC Drive devices. In addition, you must have an understanding of the parameter settings and functions.

What Is Not In This Manual

The PowerFlex 750-Series User Manual is designed to provide only basic start-up information.

Recommended Documentation

All the recommended documentation listed in this section is available online at www.rockwellautomation.com/literature.

The following publications provide general drive information.

Title	Publication
Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives	DRIVES-IN001
Safety Guidelines for the Application, Installation and Maintenance of Solid State Control	SGI-1.1
A Global Reference Guide for Reading Schematic Diagrams	100-2.10
Guarding Against Electrostatic Damage	8000-4.5.2

The following publications provide specific PowerFlex 750-Series drive features information:

Title	Publication
Enhanced PowerFlex 7-Class Human Interface Module (HIM) User Manual	20HIM-UM001
PowerFlex 750-Series Safe Torque Off User Manual	750-UM002
Safe Speed Monitor Option Module for PowerFlex 750-Series AC Drives Reference Manual	750-RM001
PowerFlex 7-Class Network Communication Adapter User Manuals	750COM-UM
Dynamic Braking Resistor Calculator	PFLEX-AT001
DeviceLogix User Manual	RA-UM003

The following publications provide necessary information when applying the DriveLogix Controller:

Title	Publication
DriveLogix5730 Controller User Manual	20D-UM003
PowerFlex 755 Drive & DriveLogix Controller	20D-RN007
Logix5000 Controllers Common Procedures	1756-PM001
Logix5000 Controllers General Instructions	1756-RM003
Logix5000 Controllers Process Control and Drives Instructions	1756-RM006
RSLogix 5000 Getting Results	9399-RLD300GR

The following publications provide information that is useful when planning and installing communication networks:

Title	Publication
ControlNet Coax Tap Installation Instructions	1786-5.7
ControlNet Cable System Planning and Installation Manual	1786-6.2.1
ControlNet Fiber Media Planning and Installation Guide	CNET-IN001

Obtaining Manuals

To order paper copies of technical documentation, contact your local Rockwell Automation distributor or sales representative.

To find your local Rockwell Automation distributor, visit www.rockwellautomation.com/locations

Allen-Bradley Drives Technical Support

Product Certification

Product Certifications and Declarations of Conformity are available on the internet at: www.rockwellautomation.com/products/certification

Manual Conventions

- In this manual we refer to PowerFlex 750-Series Adjustable Frequency AC Drives as: drive, PowerFlex 750, PowerFlex 750 drive or PowerFlex 750 AC drive.
- Specific drives within the PowerFlex 750-Series may be referred to as:
 - PowerFlex 753, PowerFlex 753 drive or PowerFlex 753 AC drive
 - PowerFlex 755, PowerFlex 755 drive or PowerFlex 755 AC drive
- To help differentiate parameter names and LCD display text from other text, the following conventions will be used:
 - Parameter Names will appear in [brackets] after the Parameter Number.
For example: parameter 308 [Direction Mode].
 - Display text will appear in “quotes.” For example: “Enabled.”
- The following words are used throughout the manual to describe an action:

Word	Meaning
Can	Possible, able to do something
Cannot	Not possible, not able to do something
May	Permitted, allowed
Must	Unavoidable, you must do this
Shall	Required and necessary
Should	Recommended
Should Not	Not recommended

Drive Frame Sizes

Similar PowerFlex 750-Series drive sizes are grouped into frame sizes to simplify spare parts ordering, dimensioning, etc. A cross reference of drive catalog numbers and their respective frame size is provided in [Appendix A](#).

General Precautions

Qualified Personnel

ATTENTION: Only qualified personnel familiar with adjustable frequency AC drives and associated machinery should plan or implement the installation, start-up and subsequent maintenance of the system. Failure to comply may result in personal injury and/or equipment damage.

Personal Safety

ATTENTION: To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged completely before servicing. Check the DC bus voltage at the Power Terminal Block by measuring between the +DC and -DC terminals (refer to [Chapter 1](#) for location), between the +DC terminal and the chassis, and between the -DC terminal and the chassis. The voltage must be zero for all three measurements.

ATTENTION: Hazard of personal injury or equipment damage exists when using bipolar input sources. Noise and drift in sensitive input circuits can cause unpredictable changes in motor speed and direction. Use speed command parameters to help reduce input source sensitivity.

ATTENTION: Risk of injury or equipment damage exists. DPI or SCANport host products must not be directly connected together via 1202 cables. Unpredictable behavior can result if two or more devices are connected in this manner.

ATTENTION: The drive start/stop/enable control circuitry includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exists, an additional hardwired stop circuit may be required to remove the AC line to the drive. An auxiliary braking method may be required.

ATTENTION: Hazard of personal injury or equipment damage due to unexpected machine operation exists if the drive is configured to automatically issue a Start or Run command. Do not use these functions without considering applicable local, national and international codes, standards, regulations or industry guidelines.

Product Safety

ATTENTION: An incorrectly applied or installed drive can result in component damage or a reduction in product life. Wiring or application errors such as under sizing the motor, incorrect or inadequate AC supply, or excessive surrounding air temperatures may result in malfunction of the system.

ATTENTION: This drive contains ESD (Electrostatic Discharge) sensitive parts and assemblies. Static control precautions are required when installing, testing, servicing or repairing this assembly. Component damage may result if ESD control procedures are not followed. If you are not familiar with static control procedures, reference Guarding Against Electrostatic Damage, publication 8000-4.5.2 or any other applicable ESD protection handbook.

ATTENTION: Configuring an analog input for 0-20 mA operation and driving it from a voltage source could cause component damage. Verify proper configuration prior to applying input signals.

ATTENTION: A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals that will start and stop the motor. If an input device is used, operation must not exceed one cycle per minute or drive damage will occur.

Class 1 LED Product

ATTENTION: Hazard of permanent eye damage exists when using optical transmission equipment. This product emits intense light and invisible radiation. Do not look into module ports or fiber optic cable connectors.

Safe Torque Off Option Module	1-44
Safe Speed Monitor Option Module	1-45
Auxiliary Power Supply Option Module	1-46
DeviceNet Option Module	1-47
20-COMM Carrier	1-49
CE Conformity	1-50

Most start-up difficulties are the result of incorrect wiring. Every precaution must be taken to assure that the wiring is done as instructed. All items must be read and understood before the actual installation begins.

ATTENTION: The following information is merely a guide for proper installation. Rockwell Automation, Inc. cannot assume responsibility for the compliance or the noncompliance to any code, national, local or otherwise for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

Lifting the Drive

The dimensions and weights specified must be taken into consideration when mounting the drive. All lifting equipment and lifting components (hooks, bolts, lifts, slings, chains, etc.) must be properly sized and rated to safely lift and hold the weight of the drive while mounting.

ATTENTION: To guard against possible personal injury and/or equipment damage...

- Inspect all lifting hardware for proper attachment before lifting drive.
- Do not allow any part of the drive or lifting mechanism to make contact with electrically charged conductors or components.
- Do not subject the drive to high rates of acceleration or deceleration while transporting to the mounting location or when lifting.
- Do not allow personnel or their limbs directly underneath the drive when it is being lifted and mounted.

Figure 1.1 Frame 6 Open Type and Flange Mount: Weight: 38.6 kg (85.0 lb)

Figure 1.2 Frame 7 Open Type and Flange Mount: Weight: 72.6...108.9 kg (160...240 lb)

Opening the Cover

Figure 1.3 IP20, NEMA/UL Open Type, Frames 2...5

Figure 1.4 IP54, NEMA/UL Type 12, Frames 2...5

When cover is replaced:

- Recommended torque (screws and nuts) = 0.68 N•m (6.0 lb•in)
- Recommended screwdriver = 6.4 mm (0.25 in.) flat or T20 Hexalobular
- Recommended hex socket = 7 mm

Figure 1.5 IP00, NEMA/UL Open Type, Frames 6 & 7

When cover is replaced:

- Recommended screwdriver = 6.4 mm (0.25 in.) flat

Figure 1.6 IP00, NEMA/UL Open Type, Frames 6 & 7 Access Door

When door is replaced:

- Recommended screwdriver = 6.4 mm (0.25 in.) flat or T20 Hexalobular

Mounting Considerations

Operating Conditions and Temperatures

PowerFlex 750-Series drives are designed to operate at the following air temperatures without derating.

Table 1.A Acceptable Surrounding Air Temperature

Enclosure Rating	Temperature Range	Drive
IP20, NEMA/UL Open Type	0...50 °C (32...122 °F)	Frames 2...5, All Ratings
IP00, NEMA/UL Open Type	0...50 °C (32...122 °F)	Frames 6...7, All Ratings
IP20, NEMA/UL Type 1 (with Debris Hood)	0...40 °C (32...104 °F)	Frames 2...5, All Ratings
IP20, NEMA/UL Type 1 (with Debris Label)	0...40 °C (32...104 °F)	Frames 6...7, All Ratings
Flange Mount - Front: IP20, NEMA/UL Open Type IP00, NEMA/UL Open Type Back/Heat Sink: IP66, NEMA/UL Type 4X	0...50 °C (32...122 °F) 0...50 °C (32...122 °F) 0...40 °C (32...104 °F)	Frames 2...5, All Ratings Frames 6...7, All Ratings All Frames, All Ratings
Stand-alone/Wall Mount - IP54, NEMA/UL Type 12	0...40 °C (32...104 °F)	All Frames, All Ratings

Minimum Mounting Clearances

Specified vertical clearance requirements are intended to be from drive to drive. Other objects can occupy this space; however, reduced airflow may cause protection circuits to fault the drive. The drive must be mounted in a vertical orientation as shown. In addition, inlet air temperature must not exceed the product specification.

AC Supply Source Considerations

PowerFlex 750-Series drives are suitable for use on a circuit capable of delivering up to a maximum of 200,000 rms symmetrical amperes, 480 volts with recommended fuses/circuit breakers.

ATTENTION: To guard against personal injury and/or equipment damage caused by improper fusing or circuit breaker selection, use only the recommended line fuses/circuit breakers specified in [Appendix A](#).

If a Residual Current Detector (RCD) is used as a system ground fault monitor, only Type B (adjustable) devices should be used to avoid nuisance tripping.

Unbalanced, Ungrounded, Impedance or Phase Grounded Distribution Systems

If phase to ground voltage will exceed 125% of normal line to line voltage or the supply system is ungrounded, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001.

ATTENTION: PowerFlex 750-Series drives contain protective MOVs and common mode capacitors that are referenced to ground. To guard against drive damage, these devices must be configured according to the recommendations in [Table 1.J on page 1-24](#). See pages [1-25...1-26](#) for jumper locations.

Input Power Conditioning

Certain events on the power system supplying a drive can cause component damage or shortened product life. These conditions are divided into 2 basic categories:

1. All Drives

- The power system has power factor correction capacitors switched in and out of the system, either by the user or by the power company.
- The power source has intermittent voltage spikes in excess of 6000 volts. These spikes could be caused by other equipment on the line or by events such as lightning strikes.
- The power source has frequent interruptions.

2. 5 Hp or Less Drives (in addition to “1” above)

- The supply transformer is larger than 100 kVA or the available short circuit (fault) current is greater than 100,000A.
- The impedance on the input side of the drive is less than 0.5%.

If any of these conditions exist, additional source impedance is required. The total input impedance is a function of all transformers, cabling, and reactors (if used) that supply power to the drive. The impedance can be calculated using the information supplied in Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001.

Grounding Requirements

The drive Safety Ground-PE must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be periodically checked.

Recommended Grounding Scheme

A single point (PE only) grounding scheme should be used. Some applications may require alternate grounding schemes, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001, for more information. These applications include installations with long distances between drives or drive line-ups, which could cause large potential differences between the drive or line-up grounds.

For installations within a cabinet, a single safety ground point or ground bus bar connected directly to building steel should be used. All circuits including the AC input ground conductor should be grounded independently and directly to this point/bar.

Figure 1.7 Typical Grounding

Shield Termination - SHLD

The Shield terminal (see [page 1-15](#)) provides a grounding point for the motor cable shield. It must be connected to an earth ground by a separate continuous lead. The **motor cable** shield should be connected to this terminal on the drive (drive end) and the motor frame (motor end). Use a shield terminating or EMI clamp to connect shield to this terminal.

RFI Filter Grounding

Using an optional RFI filter may result in relatively high ground leakage currents. Therefore, the **filter must only be used in installations with grounded AC supply systems and be permanently installed and solidly grounded** (bonded) to the building power distribution ground. Ensure that the incoming supply neutral is solidly connected (bonded) to the same building power distribution ground. Grounding must not rely on flexible cables and should not include any form of plug or socket that would permit inadvertent disconnection. Some local codes may require redundant ground connections. The integrity of all connections should be periodically checked. Refer to the instructions supplied with the filter.

Fuses and Circuit Breakers

PowerFlex 750-Series drives can be installed with either input fuses or an input circuit breaker. National and local industrial safety regulations and/or electrical codes may determine additional requirements for these installations. Refer to [Appendix A](#) for recommended fuses/circuit breakers.

ATTENTION: PowerFlex 750-Series drives do not provide input power short circuit protection. Specifications for the recommended fuse or circuit breaker to provide drive input power protection against short circuits are provided in [Appendix A](#).

Power Wiring

Most start-up difficulties are the result of incorrect wiring. Every precaution must be taken to assure that the wiring is done as instructed. All items must be read and understood before the actual installation begins.

ATTENTION: The following information is merely a guide for proper installation. Rockwell Automation, Inc. cannot assume responsibility for the compliance or the noncompliance to any code, national, local or otherwise for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

Power Cable Types Acceptable for 200...600 Volt Installations

ATTENTION: National Codes and standards (NEC, BSI etc.) and local codes outline provisions for safely installing electrical equipment. Installation must comply with specifications regarding wire types, conductor sizes, branch circuit protection and disconnect devices. Failure to do so may result in personal injury and/or equipment damage.

A variety of cable types are acceptable for drive installations. For many installations, unshielded cable is adequate, provided it can be separated from sensitive circuits. As an approximate guide, allow a spacing of 0.3 meters (1 foot) for every 10 meters (32.8 feet) of length. In all cases, long parallel runs must be avoided. Do not use cable with an insulation thickness less than or equal to 15 mils (0.4mm/0.015 in.). Use copper wire only. Wire gauge requirements and recommendations are based on 75 °C. Do not reduce wire gauge when using higher temperature wire.

Table 1.B Recommended Cable Design

Rating/Type	Description
600V 75 °C (167 °F)	<ul style="list-style-type: none"> • Four tinned copper conductors with XLPE insulation. • Copper braid/aluminum foil combination shield and tinned copper drain wire. • PVC jacket.

Unshielded

THHN, THWN or similar wire is acceptable for drive installation in dry environments provided adequate free air space and/or conduit fill rates limits are provided. **Do not use THHN or similarly coated wire in wet areas.** Any wire chosen must have a minimum insulation thickness of 15 Mils and should not have large variations in insulation concentricity.

Shielded/Armored Cable

Shielded cable contains all of the general benefits of multi-conductor cable with the added benefit of a copper braided shield that can contain much of the noise generated by a typical AC Drive. Strong consideration for shielded cable should be given in installations with sensitive equipment such as weigh scales, capacitive proximity switches and other devices that may be affected by electrical noise in the distribution system. Applications with large numbers of drives in a similar location, imposed EMC regulations or a high degree of communications/networking are also good candidates for shielded cable.

Shielded cable may also help reduce shaft voltage and induced bearing currents for some applications. In addition, the increased impedance of shielded cable may help extend the distance the motor can be located from the drive without the addition of motor protective devices such as terminator networks. Refer to “Reflected Wave” in Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001.

Consideration should be given to all of the general specifications dictated by the environment of the installation, including temperature, flexibility, moisture characteristics and chemical resistance. In addition, a braided shield should be included and specified by the cable manufacturer as having coverage of at least 75%. An additional foil shield can be greatly improve noise containment.

A good example of recommended cable is Belden® 295xx (xx determines gauge). This cable has 4 XLPE insulated conductors with a 100% coverage foil and an 85% coverage copper braided shield (with drain wire) surrounded by a PVC jacket.

Other types of shielded cable are available, but the selection of these types may limit the allowable cable length. Particularly, some of the newer cables twist 4 conductors of THHN wire and wrap them tightly with a foil shield. This construction can greatly increase the cable charging current required and reduce the overall drive performance. Unless specified in the individual

distance tables as tested with the drive, these cables are not recommended and their performance against the lead length limits supplied is not known.

EMC Compliance

Refer to [CE Conformity on page 1-50](#) for details.

Cable Trays and Conduit

If cable trays or large conduits are to be used, refer to guidelines presented in Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001.

ATTENTION: To avoid a possible shock hazard caused by induced voltages, unused wires in the conduit must be grounded at both ends. For the same reason, if a drive sharing a conduit is being serviced or installed, all drives using this conduit should be disabled. This will help minimize the possible shock hazard from “cross coupled” motor leads.

Motor Cable Lengths

Typically, motor lead lengths less than 30 meters (100 feet) are acceptable. However, if your application dictates longer lengths, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001 for details.

Motor Considerations

Due to the operational characteristics of AC variable frequency drives, motors with inverter grade insulation systems designed to meet or exceed NEMA MG1 Part 31.40.4.2 standards for resistance to spikes of 1600 volts are recommended.

Guidelines must be followed when using non-inverter grade motors to avoid premature motor failures. Refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001 for recommendations.

Single-Phase Input Power

The PowerFlex 750-Series drive is typically used with a three-phase input supply. Single-phase operation of the drive is not currently rated under UL508C listing. Rockwell Automation has verified that single-phase operation with output current derated by 50% of the three-phase ratings identified on page [A-11](#) will meet all safety requirements.

Power Terminal Blocks

Table 1.C Frames 2...5 Power Terminal Block

Frame	Wire Size Range ^{(1) (2)}		Strip Length	Recommended Torque	Recommended Tool(s)
	Maximum	Minimum			
2	4.0 mm ² (10 AWG)	0.2 mm ² (24 AWG)	8.0 mm (0.31 in.)	0.5 N•m (4.4 lb•in)	#1 Flat Screwdriver
3	16.0 mm ² (6 AWG)	0.5 mm ² (20 AWG)	10.0 mm (0.39 in.)	1.2 N•m (10.6 lb•in)	#2 Flat Screwdriver
4	25.0 mm ² (3 AWG)	2.5 mm ² (14 AWG)	10.0 mm (0.39 in.)	2.7 N•m (24 lb•in)	#2 Pozidrive® 492-C Phillips® 0.25 in. Flat Screwdriver
5	35.0 mm ² (1 AWG)	10.0 mm ² (8 AWG)	12.0 mm (0.5 in.)	4.0 N•m (35 lb•in)	#2 Pozidrive® 492-C Phillips® 0.25 in. Flat Screwdriver

(1) Maximum/minimum wire sizes that the terminal block will accept - these are not recommendations.

(2) Terminal blocks are designed to accept a single wire.

Table 1.D Frames 6 & 7 Power Terminal Block

If you intend to connect a motor that is not rated inverter grade, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001 for recommendations.

IP65, NEMA Type 12 Installations

Use the plugs supplied with IP65 (NEMA Type 12) rated drives to seal unused holes in the conduit entry plate.

Important: Completely seat the plug inner rim for the best seal.

Using Input/Output Contactors

Input Contactor Precautions

ATTENTION: A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals that will start and stop the motor. If an input device is used, operation must not exceed one cycle per minute or drive damage will occur.

ATTENTION: The drive start/stop/enable control circuitry includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exist, an additional hardwired stop circuit may be required to remove the AC line to the drive. An auxiliary braking method may be required.

Output Contactor Precautions

ATTENTION: To guard against drive damage when using output contactors, the following information must be read and understood. One or more output contactors may be installed between the drive and motor(s) for the purpose of disconnecting or isolating certain motors/loads. If a contactor is opened while the drive is operating, power will be removed from the respective motor, but the drive will continue to produce voltage at the output terminals. In addition, reconnecting a motor to an active drive (by closing the contactor) could produce excessive current that may cause the drive to fault. If any of these conditions are determined to be undesirable or unsafe, an auxiliary contact on the output contactor should be wired to a drive digital input that is programmed as “Enable.” This will cause the drive to execute a coast-to-stop (cease output) whenever an output contactor is opened.

Dynamic Brake Resistor Considerations

ATTENTION: The drive does not offer protection for externally mounted brake resistors. A risk of fire exists if external braking resistors are not protected. External resistor packages must be self-protected from over temperature or a circuit equivalent to [Figure C.1 on page C-2](#) must be supplied.

Using PowerFlex 750-Series Drives with Regenerative Power Units

If a Regenerative unit (i.e., 1336 REGEN) is used as a bus supply or a brake, the common mode capacitors should be disconnected (see Drive Power Jumper Configuration).

Regenerative Unit to Drive Connections

Regenerative Brake Mode

Frame(s)	Terminals	
	1336 Regen	PowerFlex 750-Series Drive
2...7	DC+ & DC-	+DC & -DC

Regenerative Bus Supply Mode

Frame(s)	Terminals	
	1336 Regen	PowerFlex 750-Series Drive
2...7	DC+ & DC-	+DC & -DC

Refer to 1336 REGEN Line Regeneration Package User Manual, publication 1336-REGEN-5.0, for more information.

Drive Power Jumper Configuration

PowerFlex 750-Series drives contain protective MOVs and common mode capacitors that are referenced to ground. To guard against drive damage and/or operation problems, these devices must be properly configured according to [Table 1.J](#).

MOV, AC EMI Capacitor, and Common Mode Capacitor Circuits

Figure 1.12 MOV and AC EMI Capacitor Phase to Ground

Figure 1.13 Common Mode Capacitors to Ground

ATTENTION: PE-A and PE-B jumpers must be configured according to the recommendations in [Table 1.J](#).

ATTENTION: To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged completely before removing/installing jumpers. Check the DC bus voltage at the Power Terminal Block by measuring between the +DC and -DC terminals (refer to [Figure 1.8](#) and [Figure 1.9](#) for location), between the +DC terminal and the chassis, and between the -DC terminal and the chassis. The voltage must be zero for all three measurements.

Table 1.J Recommended Power Jumper Configurations

Power Source Type ⁽¹⁾	MOV / Input Filter Caps (PE-A) ⁽²⁾	DC Bus Common Mode Caps (PE-B)	Default Configuration (Cat. No. Position 11)	Benefits Of Correct Configuration on Power Source Type
Unknown	Connected	Disconnected	A	See below.
<ul style="list-style-type: none"> • AC fed Solidly Grounded • DC fed from passive rectifier which has a Solidly Grounded AC source 	Connected	Connected	J	UL compliance, Reduced electrical noise, Most stable operation, EMC compliance, Reduced voltage stress on components and motor bearings
<ul style="list-style-type: none"> • AC fed Ungrounded • Impedance Grounded • DC fed from an active converter 	Disconnected	Disconnected	N/A	Helps avoid severe equipment damage when ground fault occurs

(1) It is highly recommended to accurately determine the power source type and then configure appropriately.

(2) When MOVs are disconnected, the power system must have its own transient protection to insure known and controlled voltages.

To connect or disconnect these devices, refer to the jumper locations shown in [Figure 1.15](#), [Figure 1.16](#) and [Figure 1.17](#).

In addition, on an ungrounded distribution system where the line-to-ground voltages on any phase could exceed 125% of the nominal line-to-line voltage, an isolation transformer should be installed. See Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001 at www.rockwellautomation.com/literature for more information on impedance grounded and ungrounded systems.

Power Jumper Screw Removal and Storage

Frames 2...5 use jumper screws to complete an electrical connection when installed. Install or remove jumper screws according to the recommendations in [Table 1.J](#).

ATTENTION: Hazard of equipment damage exists if jumpers are not properly disconnected. For Frames 2...5, completely remove the jumper screw from the circuit board.

When power Jumper screws are not used, they are stored on the left interior chassis wall as shown.

Figure 1.14 Typical Frame 2...5 Jumper Screw Storage Location (Frame 4 shown)

When screws are installed:

- Recommended torque = 1.36 N•m (12.0 lb•in) +/- 0.14 N•m (1.2 lb•in)
- Recommended screwdriver = 6.4 mm (0.25 in.) flat or T15 Hexalobular

Figure 1.15 Typical Frame 2...5 Jumper Screw Installation Locations (Frame 4 shown)

Power Jumper Wire Removal and Storage

Frames 6...7 use jumper wires to complete an electrical connection when installed. Install or remove jumper wires according to the recommendations in [Table 1.J](#).

ATTENTION: Hazard of equipment damage exists if jumpers are not properly disconnected. For Frames 6...7, secure the disconnected jumper wire to the standoff provided.

Figure 1.16 Frame 6 Jumper Wire Locations

When jumper wires are connected:

- Recommended torque (screws and nuts) = 1.36 N•m (12.0 lb•in)
- Recommended hex socket = 7 mm
- Recommended screwdriver = T20 Hexalobular

Figure 1.17 Frame 7 Jumper Wire Locations

When jumper wires are connected:

- Recommended torque (screws and nuts) = 1.36 N•m (12.0 lb•in)
- Recommended hex socket = 7 mm
- Recommended screwdriver = T20 Hexalobular

I/O Wiring

Important points to remember about I/O wiring:

- Always use copper wire.
- Wire with an insulation rating of 600V or greater is recommended.
- Control and signal wires should be separated from power wires by at least 0.3 meters (1 foot).
- In order to maintain electrical safety for all user-accessible low voltage circuits (ELV and PELV circuits), I/O terminals designated for 24V or lower voltage must not be connected to a circuit of higher voltage or a circuit which is not adequately insulated from dangerous voltages with double or reinforced insulation within other connected equipment or wiring.
- In order to provide electrical safety for user-accessible low voltage I/O circuits which are referenced to earth (PELV circuits) and which may be touched simultaneously, care should be taken to provide a common earth reference for all equipment connected to the drive.

Important: I/O terminals labeled “(-)” or “Common” are not referenced to earth ground and are designed to greatly reduce common mode interference. Grounding these terminals can cause signal noise.

ATTENTION: Hazard of personal injury or equipment damage exists when using bipolar input sources. Noise and drift in sensitive input circuits can cause unpredictable changes in motor speed and direction. Use speed command parameters to help reduce input source sensitivity.

I/O Terminal Blocks

Table 1.K I/O Terminal Block Specifications

Name	Wire Size Range		Torque		Strip Length
	Maximum	Minimum	Maximum	Recommended	
753 Control Module TB2	2.5 mm ² (14 AWG)	0.3 mm ² (28 AWG)	0.25 N•m (2.2 lb•in)	0.2 N•m (1.8 lb•in)	6 mm (0.24 in.)

Auxiliary Power Supply TB1	2.5 mm ² (14 AWG)	0.3 mm ² (28 AWG)	0.25 N•m (2.2 lb•in)	0.2 N•m (1.8 lb•in)	6 mm (0.24 in.)

Access Drive Control Pod

1. Remove drive cover

Frames 2...5

- Squeeze locking tabs and pull out bottom of cover.
- Pull cover down and away from the chassis.

Frames 6...7

- Loosen door screws.
- Gently pry the door open to remove.

2. Lift the Human Interface Module (HIM) cradle.

All Frames

- Loosen the retention screw.
- Lift the cradle until the latch engages.

PowerFlex 753 Main Control Board

Table 1.L 753 Main Control Board Details

No.	Name	Description
❶	HIM Connector	DPI Port 1 (HIM Cradle) connection.
❷	Fan Connector	Power supply for internal cooling fan (Frames 2 & 3).
❸	Battery Receptacle	User installed CR1220 lithium coin cell battery provides power to the Real Time Clock (Optional, not supplied).
❹	Jumper J1 ENABLE	Hardware enable jumper. Removed when a hardware enable configuration is utilized.
❺	Jumper J2 SAFETY	Safety enable jumper. Removed when safety option is installed.
❻	Jumper J4 Input Mode	Input mode jumper. Select voltage mode or current mode.
❼	TB1	I/O terminal block.
❽	DPI Port 2	Cable connection for handheld and remote HIM options.
❾	TB3	Digital input power terminal block.
❿	TB2	Relay terminal block.

Table 1.M J4 Input Mode Jumper

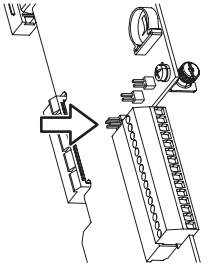

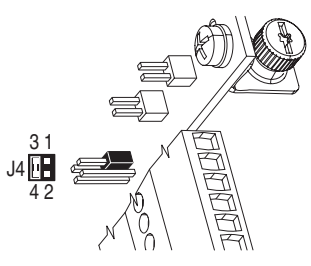

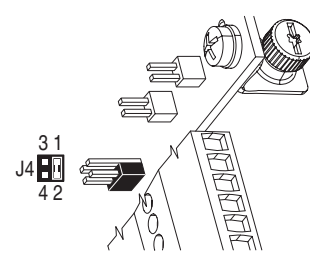

Jumper Position	Voltage Mode	Current Mode
		

Table 1.N TB1 Terminal Designations

Terminal	Name	Description	Related Param
Ao0-	Analog Out 0 (-)	Bipolar, ±10V, 11 bit & sign, 2 k ohm minimum load. 4-20 mA, 11 bit & sign, 400 ohm maximum load.	
Ao0+	Analog Out 0 (+)		
10VC	10 Volt Common	For (+) 10 Volt references. 2k ohm minimum.	
+10V	+10 Volt Reference		
Ai0-	Analog Input 0 (-)	Isolated ⁽¹⁾ , bipolar, differential, ±10V, 11 bit & sign, 88k ohm input impedance.	
Ai0+	Analog Input 0 (+)		
Ptc-	Motor PTC (-)	Motor protection device (Positive Temperature Coefficient).	
Ptc+	Motor PTC (+)		
T0	Transistor Output 0	Open drain output, 48V DC 250 mA maximum load.	
24VC	24 Volt Common	Drive supplied logic input power. 150 mA maximum	
+24V	+24 Volt DC		
Di C	Digital Input Common	24V DC - Opto isolated Low State: less than 5V DC High State: greater than 20V DC	
Di 1	Digital Input 1		
Di 2	Digital Input 2		

(1) Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.

Note: 753 Main Control Board I/O TB1 wiring examples begin on [page 1-38](#).

Table 1.O TB2 Terminal Designations

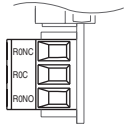

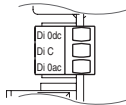

Fixed I/O	Terminal	Name	Description
	R0NC	Relay 0 N.C.	Output Relay 0 normally closed contact.
	R0C	Relay 0 Common	Output Relay 0 common
	R0NO	Relay 0 N.O.	Output Relay 0 normally open contact.

Table 1.P TB3 Terminal Designations

Power Block	Terminal	Name	Description
	Di 0dc	Digital Input 24V DC	Connections for DC power supply.
	Di C	Digital Input Common	Digital input common
	Di 0ac	Digital Input 120V AC	Connections for AC power supply.

Important: Wiring to pluggable terminal block connectors should be supported by wire ties or other means to help prevent unintentional disconnection.

PowerFlex 755 Main Control Board

Table 1.Q 755 Main Control Board Details

No.	Name	Description
1	HIM Connector	DPI Port 1 (HIM Cradle) connection.
2	Fan Connector	Power supply for internal cooling fan (Frames 2 & 3).
3	Battery Receptacle	User installed CR1220 lithium coin cell battery provides power to the Real Time Clock (Optional, not supplied).
4	DPI Port 2	Cable connection for handheld and remote HIM options.
5	Embedded EtherNet/IP ⁽¹⁾ Address Selectors	Rotary switches for setting lowest octet of EtherNet address (forces address to 192.168.1.xxx). Refer to page 2-5 for instructions on setting the IP address.
6	Embedded EtherNet/IP ⁽¹⁾ Connector	Network cable connection.
7	Jumper J2 SAFETY	Safety enable jumper. Removed when safety option is installed.
8	Jumper J1 ENABLE	Hardware enable jumper. Removed when a hardware enable configuration is utilized.
9	TB1	I/O terminal block.

(1) Refer to the PowerFlex 755 Drive Embedded EtherNet/IP Adapter User Manual, publication 750COM-UM001.

Table 1.R TB1 I/O Terminal Designations

Fixed I/O	Terminal	Name	Description
	Di 0ac	Digital Input 120V AC	Connections for AC power supply.
	Di C	Digital Input Common	Digital input common
	Di 0dc	Digital Input 24V DC	Connections for DC power supply.
	+24V	+24 Volt Power	Connections for drive supplied 24V power.
	24VC	24 Volt Common	

Important: Wiring to pluggable terminal block connectors should be supported by wire ties or other means to help prevent unintentional disconnection.

Hardware Enable Circuitry

The main control board has one digital input that can be used as a general purpose programmable input, or by removal of a jumper, configured as a dedicated hardware enable, which is unaffected by parameter settings. To configure the input as a dedicated hardware enable, complete the following steps.

1. Access the control pod as described beginning on [page 1-29](#).
2. Locate and remove Jumper J1 ENABLE on the main control board (see diagram).

PowerFlex 753 - J1 Jumper Location

PowerFlex 755 - J1 Jumper Location

Safety Enable Circuitry

The drive ships with the safety enable jumper (J2 SAFETY) installed. This jumper must be removed when using the safe torque off or speed monitoring safety options.

Important: Failure to remove the jumper will cause the drive to fault when a start command is issued.

PowerFlex 753 - J2 Jumper Location

PowerFlex 755 - J2 Jumper Location

Option Module Installation

Compatible port locations may be restricted for each module. An icon with position number(s) is provided to indicate which option module ports are compatible. For example, the icon to the right indicates that the option module is only compatible with port 4.

ATTENTION: Hazard of equipment damage exists if an option module is installed or removed while the drive is powered. To avoid damaging the drive, verify that the voltage on the bus capacitors has discharged completely and all control power is removed before performing any work on the drive. Check the DC bus voltage at the Power Terminal Block by measuring between the +DC and -DC terminals (refer to [page 1-17](#) for location), between the +DC terminal and the chassis, and between the -DC terminal and the chassis. The voltage must be zero for all three measurements.

To install an option module:

1. Firmly press the module edge connector into the desired port.
2. Tighten the top and bottom retaining screws.
 - Recommended torque = 0.45 N•m (4.0 lb•in)
 - Recommended screwdriver = T15 Hexalobular

Important: Do not over-tighten retaining screws.

Option Module Parameter Access

Refer to [Select A Device on page D-5](#) for instructions on how to access parameters on an option module.

750-Series I/O Module

20-750-2262C-2R
 20-750-2262D-2R
 20-750-2263C-1R2T

Safe Torque Off Option Module

The safe torque off option is just one component in a safety control system. Components in the system must be chosen and applied appropriately to achieve the desired level of operational safety. For detailed information on applying this option, refer to the PowerFlex 750-Series Safe Torque Off User Manual, publication 750-UM002.

Table 1.W TB2 Terminal Designations

Terminal	Name	Description
SP+	+24 Volt Safety Power	User-supplied 24 volt power. 45 mA typical
SP-	Safety Power Common	
SE+	+24 Volt Safety Enable	User-supplied 24 volt power. 25 mA typical
SE-	Safety Enable Common	
Sd	Shield	Terminating point for wire shields when an EMC plate or conduit box is not installed.
Sd	Shield	

Safety Input Power Supply	Connection Example

Installation Notes

1. Ensure the safety enable jumper (J2 SAFETY) is removed.
2. Ensure the hardware enable jumper (J1 ENABLE) is installed. If not installed, the drive will fault when a start command is issued.

Universal Feedback Encoder Option Module

See [Appendix E](#).

Incremental Encoder Option Modules

See [Appendix F](#).

Safe Speed Monitor Option Module

The Safe Speed Monitor option is just one component in a safety control system. Components in the system must be chosen and applied appropriately to achieve the desired level of operational safety. For detailed information on applying this option, refer to the Safe Speed Monitor Option Module for PowerFlex 750-Series AC Drives Safety Reference Manual, publication 750-RM001.

Installation Notes

1. Ensure the safety enable jumper (J2 SAFETY) is removed.
2. Ensure the hardware enable jumper (J1 ENABLE) is installed. If not installed, the drive will fault when a start command is issued.

Important: When the Safe Speed Monitor option is used with the Dual Incremental Encoder option ([Appendix F](#)), both modules must be installed on the same backplane (ports 6, 5, 4).

Parameter Descriptions

Safe Speed Monitor option module parameter descriptions begin on [page 3-148](#).

Auxiliary Power Supply Option Module

Table 1.Z TB1 Terminal Designations

Terminal	Name	Description
AP+	+24 Volt Auxiliary Power	Connections for customer supplied 24V/3A power supply.
AP-	Auxiliary Power Common	
Sh	Shield	Terminating point for wire shields when an EMC plate or conduit box is not installed.

Important: The Auxiliary Power Supply option module may be installed in any option port. Due to its size, the module will extend over and block an adjacent port. Therefore, installation in Port 8 is recommended.

A connector cable is provided with Auxiliary Power Supply option modules for use in PowerFlex 753 drives. The cable is used to connect a module to the backplane when installed on the upper control pod brackets. The connector cable is not used with PowerFlex 755 drives.

Figure 1.18 Auxiliary Power Supply Installation in 753 Drives

DeviceNet Option Module

For complete information on the DeviceNet Option Module, refer to the PowerFlex 750-Series Drive DeviceNet Option Module User Manual, publication 750COM-UM002.

Table 1.AA DeviceNet Option Module LED Indication

LED	Name	Description
①	Port	DPI Connection Status
②	MOD	Option Module Status
③	NET A	DeviceNet Status

Table 1.AB DeviceNet Option Module Rotary Switches

Switch	Name	Description
①	Data Rate Switch	Sets the DeviceNet data rate at which the option module communicates.
②	Node Address Switches	Sets the node address of the option module.

Table 1.AC TB1 Terminal Designations

Terminal	Color	Signal	Function
5	Red	V+	Power Supply
4	White	CAN_H	Signal High
3	Bare	SHIELD	Shield
2	Blue	CAN_L	Signal Low
1	Black	V-	Common

ControlNet Option Module

For complete information on the ControlNet Option Module, refer to the PowerFlex 20-750-CNETC Coaxial ControlNet Option Module User Manual, publication 750COM-UM003.

Table 1.AD ControlNet Option Module LED Indication

LED	Name	Description
①	Port	DPI Connection Status
②	MOD	Option Module Status
③	NET A	ControlNet Channel A Status
④	NET B	ControlNet Channel B Status

Table 1.AE ControlNet Option Module Rotary Switches

Switch	Name	Description
①	TENS Switch	Sets the node address of the option module.
②	ONES Switch	

Table 1.AF Coax Receptacles

Receptacle	Name	Description
①	Channel A	Channel A BNC connection to the network.
②	Channel B	Channel B (redundant) BNC connection to the network

20-COMM Carrier

Enables use of some 20-COMM adapters with PowerFlex 750-Series drives. See [Table 1.AG](#).

Refer to publication 750COM-IN001 for instructions on installing a 20-COMM adapter on the 20-COMM Carrier.

Table 1.AG 20-COMM-* Network Adapter Compatibility with 750-Series Drives

Adapter Type	Accesses Ports 2, 3, and 6 for I/O Connections (Implicit and Explicit Messaging)	Accesses Port 7 through 14 Devices	Supports Drive Add On Profiles	Supports Asian-Languages ⁽⁵⁾
20-COMM-B BACnet MS/TP		No		
20-COMM-C ControlNet (Coax)	✓ ⁽¹⁾	✓ v3.001 ⁽³⁾	✓ ⁽⁴⁾	✓ v3.001 ⁽³⁾
20-COMM-D DeviceNet		✓ v2.005 ⁽³⁾		No
20-COMM-E EtherNet/IP		✓ v4.001 ⁽³⁾	✓ ⁽⁴⁾	✓ v4.001 ⁽³⁾
20-COMM-H RS-485 HVAC	✓ ⁽²⁾		No	
20-COMM-I Interbus	✓ ⁽¹⁾			
20-COMM-K CANopen				
20-COMM-L LonWorks	No			
20-COMM-M Modbus/TCP	✓ ⁽¹⁾	✓ v2.001 ⁽³⁾	No	✓ v2.001 ⁽³⁾
20-COMM-P Profibus DP			No	
20-COMM-Q ControlNet (Fiber)		✓ v3.001 ⁽³⁾	✓ ⁽⁴⁾	✓ v3.001 ⁽³⁾
20-COMM-R Remote I/O			No	
20-COMM-S RS-485 DF1				

- (1) Controller must be capable of reading/writing 32-bit floating point (REAL) values.
- (2) Only works in the Modbus RTU mode.
- (3) Requires this adapter firmware version or higher.
- (4) Requires firmware version v1.05 or higher of the drive Add On Profiles for RSLogix 5000 version v16 or higher.
- (5) Chinese, Japanese, and Korean languages are supported at the time of publication.

CE Conformity

Compliance with the Low Voltage Directive and Electromagnetic Compatibility Directive has been demonstrated using harmonized European Norm (EN) standards published in the Official Journal of the European Communities. PowerFlex 750-Series drives comply with the EN standards listed below when installed according to the PowerFlex 750-Series AC Drive Installation Instructions and this PowerFlex 750-Series AC Drive User Manual.

CE Declarations of Conformity are available online at:
www.rockwellautomation.com/products/certification/

Low Voltage Directive (2006/95/EC)

- EN 61800-5-1 Adjustable speed electrical power drive systems – Part 5-1: Safety requirements – Electrical, thermal and energy.

EMC Directive (2004/108/EC)

- EN 61800-3 Adjustable speed electrical power drive systems – Part 3: EMC product standard including specific test methods.

General Considerations

- For CE compliance, drives must satisfy installation requirements related to both EN 61800-5-1 and EN 61800-3 provided in this document.
- PowerFlex 750-Series AC Drives comply with the EMC requirements of EN 61800-3 when installed according to good EMC practices and the instructions provided in this document. However, many factors can influence the EMC compliance of an entire machine or installation, and compliance of the drive itself does not ensure compliance of all applications.
- PowerFlex 750-Series drives are not intended to be used on public low-voltage networks which supply domestic premises. Without additional mitigation, radio frequency interference is expected if used on such a network. The installer is responsible to take measures such as supplementary line filters and enclosures to prevent interference, in addition to the installation requirements of this document.
- Requirements for supplementary mitigation related to specific high frequency emission limits are provided in [Table 1.AH](#).

- PowerFlex 750-Series drives generate harmonic current emissions on the AC supply system. When operated on a public low-voltage network it is the responsibility of the installer or user to ensure that applicable requirements of the distribution network operator have been met. Consultation with the network operator and Rockwell Automation may be necessary.

ATTENTION: PowerFlex 750-Series drives produce DC current in the protective earthing conductor which may reduce the ability of RCD's (residual current-operated protective devices) or RCM's (residual current-operated monitoring devices) of type A or AC to provide protection for other equipment in the installation.

Installation Requirements Related to EN 61800-5-1 and the Low Voltage Directive

- 600V and 690V class PowerFlex 750-Series drives are designed to be CE compliant only if they are NOT connected to “corner-earthed” supply systems where one of the three phases of the supply system has been earthed.
- Voltage classes up to 480V PowerFlex 750-Series drives are compliant with the CE LV Directive when used on a “corner-earthed” supply system as well as all other common supply systems for altitudes up to and including 2000 m (6562 ft).
- When used at altitudes above 2000 m (6562 ft) up to a maximum of 4865 m (15,961 ft), PowerFlex 750-Series drives of voltage classes up to 480V may not be powered from a “corner-earthed” supply system in order to maintain compliance with the CE LV Directive.
- Drives provided in the IP54, NEMA/UL Type 12 enclosure are compliant with the CE LV Directive when installed in pollution degree 1...4 environments. All other enclosure types must be installed in a pollution degree 1 or 2 environment to be compliant with the CE LV Directive. Characteristics of the different pollution degree ratings are provided on [page A-7](#).
- NEMA/UL Open Type and Flange Mount drives must either be installed in a supplementary enclosure or equipped with a “NEMA Type 1 Kit” to be CE compliant with respect to protection against electrical shock.
- PowerFlex 750-Series drives produce leakage current in the protective earthing conductor which exceeds 3.5 mA AC and/or 10 mA DC. The minimum size of the protective earthing (grounding) conductor used in the application must comply with local safety regulations for high protective earthing conductor current equipment.

Installation Requirements Related to EN 61800-3 and the EMC Directive

- The drive must be earthed (grounded) as described in the PowerFlex 750-Series User Manual, publication 750-UM001.
- Output power wiring to the motor must employ cable with a braided shield providing 75% or greater coverage, or the cables must be housed in metal conduit, or equivalent shielding must be provided. Continuous shielding must be provided from the drive enclosure to the motor enclosure. Both ends of the motor cable shield (or conduit) must terminate with a low-impedance connection to earth. At the drive end of the motor cable, either
 - a) The cable shield must be clamped to a properly-installed “EMC plate” for the drive. Kit number 20-750-EMC1-Fx.or
 - b) The cable shield or conduit must terminate in a shielded connector used in conjunction with a properly-installed conduit plate or conduit box provided in the “NEMA Type 1 Kit” for the drive. Kit number 20-750-NEMA1-Fx.
- At the motor end, the motor cable shield or conduit must terminate in a shielded connector which must be properly installed in an earthed motor wiring box attached to the motor. The motor wiring box cover must be installed and earthed.
- All control (I/O) and signal wiring to the drive must use cable with a braided shield providing 75% or greater coverage, or the cables must be housed in metal conduit, or equivalent shielding must be provided. When shielded cable is used, only the drive end of the cable shield should be terminated with a low-impedance connection to earth. The cable shield may be terminated either by using a shielded connector in conjunction with a conduit plate or conduit box, or the shield may be clamped to an “EMC plate.”
- Motor cabling must be separated from control and signal wiring wherever possible.
- Maximum motor cable length must not exceed the maximum length indicated in [Table 1.AH](#) for compliance with radio frequency emission limits for the specific standard and installation environment.
- EMC cores must be applied to input power and motor cabling for some models of the PowerFlex 750-Series drives as indicated in [Table 1.AH](#).
- The drive must be powered from an earthed supply system such as a TN or TT system and the PE-A and PE-B jumpers in the drive must be installed (see Drive Power Jumper Configuration starting on [page 1-23](#)).

Notes:

Start Up

This chapter provides the information needed to start up the PowerFlex 750-Series drive.

For Information on ...	See Page ...
Establishing A Connection With EtherNet/IP	2-5
Prepare For Initial Drive Start-Up	2-1
Start-Up Menu	2-3
Drive Status Indicators	2-4

Start-Up Check List

- This check list supports the Start-Up menu option.
 - A Human Interface Module (HIM) is required to run the Start-Up routine.
- Important:** [Appendix D](#) provides an overview of Human Interface Module (HIM) display elements and menu navigation.
- The Start-Up routine may modify parameter values for Analog and Digital I/O.

ATTENTION: Power must be applied to the drive to perform the following start-up procedure. Some of the voltages present are at incoming line potential. To avoid electric shock hazard or damage to equipment, only qualified service personnel should perform the following procedure. Thoroughly read and understand the procedure before beginning.

Prepare For Initial Drive Start-Up

1. Confirm that all inputs are connected to the correct terminals and are secure.
2. Verify that AC line power at the disconnect device is within the rated value of the drive.
3. Verify that control power voltage is correct.

- ❑ 4. The remainder of this procedure requires that a Human Interface Module (HIM) is connected to DPI Port 1 or 2.

Figure 2.1 DPI Ports ① and ②

- ❑ 5. Apply AC power and control voltages to the drive.

If any digital inputs are configured to Stop – CF, Run, or Enable, verify that signals are present or the drive will not start. Refer to [Chapter 4](#) for a list of potential digital input conflicts.

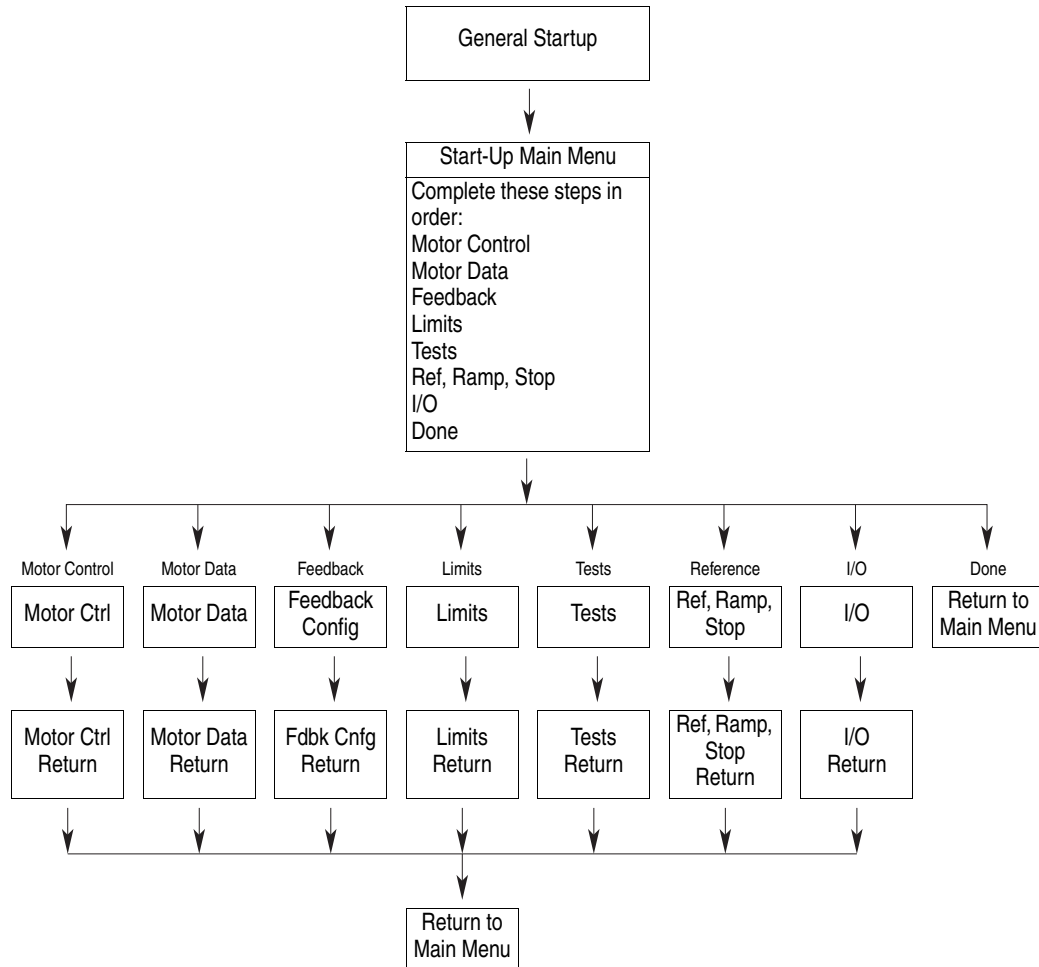

If the STS LED is not flashing green at this point, refer to [Drive Status Indicators on page 2-4](#).

- ❑ 6. When prompted, select a display language. The Start-Up Screen will automatically display for drives that have not been previously configured.
If the Start-Up screen is not displayed press the Enter key.
- ❑ 7. Press the Enter key to display the Start-Up Menu.
- ❑ 8. Use the Up/Down Arrow keys to highlight “2. Basic”.
- ❑ 9. Press the Enter key. Follow the menu using the Enter key which will step you through the Start-Up routine.

The Start-Up routine asks simple questions and prompts you to input required information.

Start-Up Menu

The Human Interface Module (HIM) displays the General Start-Up menu by default upon initial power up of the drive. To navigate to the Start-Up menu after the initial power up of the drive, follow the steps in [Navigate to Start-Up Menu Using the HIM on page D-4](#)

Drive Status Indicators

Table 2.A PowerFlex 753 Status Indicator Descriptions

Name	Color	State	Description
STS (Status)	Green	Flashing	Drive ready but not running, and no faults are present.
		Steady	Drive running, no faults are present.
	Yellow	Flashing	Drive is not running, a type 2 (non-configurable) alarm condition exists and the drive cannot be started.
		Steady	Drive is not running, a type 1 (user configurable) alarm condition exists and the drive continues to run.
	Red	Flashing	A major fault has occurred. Drive will stop. Drive cannot be started until fault condition is cleared.
		Steady	A non-resettable fault has occurred.
	Red / Yellow	Flashing Alternately	A minor fault has occurred. When running, the drive continues to run. System is brought to a stop under system control. Fault must be cleared to continue. Use parameter 950 [Minor Fit Config] to enable. If not enabled, acts like a major fault.
	Yellow / Green	Flashing Alternately	When running, a type 1 alarm exists.
Green / Red	Flashing Alternately	Drive is flash updating.	

Table 2.B PowerFlex 755 Status Indicator Descriptions

Name	Color	State	Description
STS (Status)	Green	Flashing	Drive ready but not running, and no faults are present.
		Steady	Drive running, no faults are present.
	Yellow	Flashing	Drive is not running, a type 2 (non-configurable) alarm condition exists and the drive cannot be started.
		Steady	Drive is not running, a type 1 (user configurable) alarm condition exists and the drive continues to run.
	Red	Flashing	A major fault has occurred. Drive will stop. Drive cannot be started until fault condition is cleared.
		Steady	A non-resettable fault has occurred.
	Red / Yellow	Flashing Alternately	A minor fault has occurred. When running, the drive continues to run. System is brought to a stop under system control. Fault must be cleared to continue. Use parameter 950 [Minor Fit Config] to enable. If not enabled, acts like a major fault.
	Yellow / Green	Flashing Alternately	When running, a type 1 alarm exists.
Green / Red	Flashing Alternately	Drive is flash updating.	
ENET	Unlit	Off	Adapter and/or network is not powered, adapter is not properly connected to the network, or adapter needs an IP address.
	Red	Flashing	An EtherNet/IP connection has timed out.
		Steady	Adapter failed the duplicate IP address detection test.
	Red / Green	Flashing Alternately	Adapter is performing a self-test.
	Green	Flashing	Adapter is properly connected but is not communicating with any devices on the network.
		Steady	Adapter is properly connected and communicating on the network.
LINK	Unlit	Off	Adapter is not powered or is not transmitting on the network.
	Green	Flashing	Adapter is properly connected and transmitting data packets on the network.
		Steady	Adapter is properly connected but is not transmitting on the network.

Important: The Status Indicator LEDs on the HIM cradle do not indicate the current status of an installed Communication Adapter option. If an optional Communication Adapter is installed, refer to that option's user manual for a description of LED location and indication.

Establishing A Connection With EtherNet/IP

There are three methods for configuring the embedded EtherNet/IP adapter's IP address:

- **Adapter Rotary Switches** – Use the switches when working on a simple, isolated network (for example, 192.168.1.xxx) that has other products with switches to set their IP addresses, does not need to be accessed from outside the network, and you prefer a simplified node addressing method. The three adapter switches are read when the drive powers up, and represent three decimal digits from top to bottom (see [Figure 2.2](#)). If set to a valid address (001-254), the adapter will use that value as the lower octet of its IP address (192.168.1.xxx, where xxx = rotary switch settings), along with a subnet mask of 255.255.255.0 and there will be no gateway configured. Also, the setting for adapter P36 [BOOTP] is automatically ignored.

See [Figure 2.2](#) and its accompanying table for all possible switch settings and their related descriptions.

Important: When using the adapter rotary switches, set the IP address before power is applied because the adapter uses the IP address it detects when it first receives power.

- **BOOTP Server** – Use BOOTP if you prefer to control the IP addresses of devices using a server. The IP address, subnet mask, and gateway addresses will then be provided by the BOOTP server.
- **Adapter Parameters** – Use adapter parameters when you want more flexibility in setting up the IP address, or need to communicate outside the control network using a gateway. The IP address, subnet mask, and gateway addresses will then come from the adapter parameters you set.

Important: Regardless of the method used to set the adapter's IP address, each node on the EtherNet/IP network must have a unique IP address. To change an IP address, you must set the new value and then remove and reapply power to (or reset) the adapter.

Figure 2.2 Setting the IP Address Switches

Possible Settings	Description
000	Adapter will use, depending on P36 [BOOTP], the BOOTP setting or the adapter parameter settings for the IP address.
001...254	Adapter will use the rotary switch settings for the IP address (192.168.1.xxx, where xxx = rotary switch settings).
255...887	Adapter will use, depending on P6 [BOOTP], the BOOTP setting or the adapter parameter settings for the IP address.
888	Resets the adapter IP address function to factory defaults. Thereafter, the drive must be powered down, the switches set to a setting other than 888, and then the drive must be powered up again to accept the new address.
889...998	Adapter will use, depending on P36 [BOOTP], the BOOTP setting or the adapter parameter settings for the IP address.
999 (default settings)	Disables the rotary switches. Adapter will use, depending on P36 [BOOTP], the BOOTP setting or the adapter parameter settings for the IP address.

Programming and Parameters

This chapter provides a complete listing and description of the PowerFlex 750-Series drive parameters. The parameters can be programmed (viewed/edited) using a Human Interface Module (HIM). Refer to [Appendix B](#) for information on using the HIM to view and edit parameters. As an alternative, programming can also be performed using DriveTools™ software and a personal computer.

About Parameters

To configure a drive module to operate in a specific way, certain drive parameters may have to be configured appropriately. Three types of parameters exist:

- **ENUM Parameters**
These parameters allow a selection from 2 or more items. The LCD HIM will display a text message for each item.
- **Bit Parameters**
These parameters have individual bits associated with features or conditions. If the bit is 0, the feature is off or the condition is false. If the bit is 1, the feature is on or the condition is true.
- **Numeric Parameters**
These parameters have a single numeric value (i.e. 0.1 Volts).

The following table shows how each parameter type is presented in this manual.

Table 3.A Table Explanation

①	②	③	Read-Write	Data Type	
No.	Name Description	Values			
MOTOR CONTROL	Motor Data	28 Motor NP RPM Motor Nameplate Revolutions Per Minute Rated RPM shown on the motor nameplate.	Units: RPM Default: 1750.0 Min/Max: 1.0 / 40000.0	RW	Real
	Vector Regulator	107 Trq Adapt En Torque Adaption Enable Enables or disables the adaptive torque calculation. This selection is active only in motor control mode flux vector induction (P35 [Motor Ctrl Mode] = 3 "Induction FV").	Default: 1 = "Enabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer
FEEDBACK & I/O	Digin Functions	158 DI Stop Digital Input Stop Assigns a digital input used to issue a stop command.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
	Control Board IO	220 Digital In Sts Digital Input Status Status of the digital input(s) resident on the main control board (Port 0). Options Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Digital In 0 Default 0 Bit 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	0 = Condition False 1 = Condition True		

No.	Name Description	Read-Write	Data Type	
①	File and Group organization			
	No. - Parameter Number Parameter value cannot be changed until the drive is stopped.			
②	Name - Parameter name as it appears in the DriveExecutive software.			
	Description - Brief description of parameter function. The first line is the full text parameter name. 753 = Parameter is specific to PowerFlex 753 drives only. 755 = Parameter is specific to PowerFlex 755 drives only.			
	③			
③	Values - Define the various operating characteristics of the parameter. <i>There are 3 types of Values.</i>	RW RO	32-bit Integer	
	ENUM Default: Options:			Lists the value assigned at the factory. Displays the selections available.
	Bit Default: Options:			Lists the value assigned at the factory. Displays the selections available.
	Numeric Default: Min/Max.			Lists the value assigned at the factory. Displays lowest possible setting/Displays highest possible setting.
	Indicates if parameter is read-write or read-only. RW=Read-Write RO=Read Only			
Indicates parameter data type (i.e. integer, floating point, boolean).				

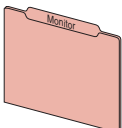

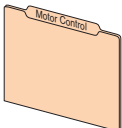

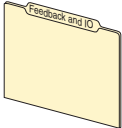

How Drive Parameters are Organized

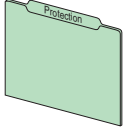

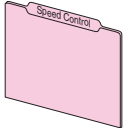

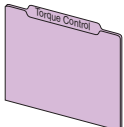

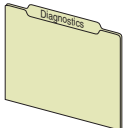

DriveExecutive programming software displays parameters in “Linear List” or “File Group Parameter” format. Viewing the parameters in “File Group Parameter” format simplifies programming by grouping parameters that are used for similar functions. There are eleven files. Each file is divided into multiple groups of parameters.

Parameter descriptions begin on [page 3-19](#).

How Option Module Parameters are Organized

Option module parameters are only available when that option is installed in a host drive. To view and edit option module parameters, select the port number of the device you want to access. See [Select A Device on page D-5](#) for instructions.

Drive Monitor File

File	Group	No.	Name Description	Values	Read-Write	Data Type
MONITOR	Metering	1	Output Frequency Output Frequency Output frequency present at terminals T1, T2, and T3 (U, V & W)	Units: Hz Default: 0.00 Min/Max: -/+650.00	RO	Real
		2	Commanded SpdRef Commanded Speed Reference Value of the active Speed/Frequency Reference. Displayed in Hz or RPM, depending on the value of P300 [Speed Units].	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		3	Mtr Vel Fdbk Motor Velocity Feedback Estimated or actual motor speed, with feedback. Displayed in Hz or RPM, depending on the value of P300 [Speed Units].	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		4	Commanded Trq Commanded Torque Final torque reference value after limits and filtering are applied. Percent of motor rated torque.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		5	Torque Cur Fdbk Torque Current Feedback Based on the motor, the amount of current that is in phase with the fundamental voltage component.	Units: Amps Default: Based on Drive Rating Min/Max: -/+P21 [Rated Amps] x 2	RO	Real
		6	Flux Cur Fdbk Flux Current Feedback Amount of current that is out of phase with the fundamental voltage component.	Units: Amps Default: Based on Drive Rating Min/Max: -/+P21 [Rated Amps] x 2	RO	Real
		7	Output Current Output Current The total output current present at terminals T1, T2, and T3 (U, V & W).	Units: Amps Default: Based on Drive Rating Min/Max: 0.00 / P21 [Rated Amps] x 2	RO	Real
		8	Output Voltage Output Voltage Output voltage present at terminals T1, T2, and T3 (U, V & W).	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / P20 [Rated Volts] x 1.15	RO	Real
		9	Output Power Output Power Output power present at terminals T1, T2, and T3 (U, V & W).	Units: kW Default: 0.00 Min/Max: 0.00/100.00	RO	Real
		10	Output Powr Fctr Output Power Factor Output power factor.	Default: 0.00 Min/Max: 0.00/1.00	RO	Real
		11	DC Bus Volts Direct Current Bus Volts DC bus voltage.	Units: VDC Default: Based on Drive Rating Min/Max: 0.00 / P20 [Rated Volts] x 2	RO	Real
		12	DC Bus Memory Direct Current Bus Memory A six-minute average of P11 [DC Bus Volts] used to estimate the DC equivalent of the input voltage. Automatically initialized upon power-up, continually updated during normal operation, and is used to trigger a power loss condition.	Units: VDC Default: Based on Drive Rating Min/Max: 0.00 / P20 [Rated Volts] x 2	RO	Real
		13	Elapsed MWH Elapsed Megawatt Hour Accumulated output energy of the drive.	Units: MWh Default: 0.000 Min/Max: 0.000 / 4294967295.000	RO	Real
		14	Elapsed kWh Elapsed Kilowatt Hour Accumulated output energy of the drive.	Units: kWh Default: 0.000 Min/Max: 0.000 / 4294967295.000	RO	Real
		15	Elapsed Run Time Elapsed Run Time Accumulated time drive is outputting power.	Units: Hrs Default: 0.000 Min/Max: 0.000 / 220000000.000	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
MONITOR	Drive Data	20	Rated Volts Rated Voltage Input voltage class (208, 240, 400 etc.) of the drive.	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / 690.00	RO	Real
		21	Rated Amps Rated Amperage Continuous current rating of drive.	Units: Amps Default: Based on Drive Rating Min/Max: 0.00 / 500.00	RO	Real
		22	Rated kW Rated Kilowatts Continuous power rating of drive.	Units: kW Default: Based on Drive Rating Min/Max: 0.00 / 400.00	RO	Real

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																								
			(1) 755 drives only.																																																					
			Bit 0 "Zero TrqStop" – Configures stopped condition when in torque mode. 0 = wait for zero speed before shutting off drive output, 1 = wait for zero torque before shutting off drive output.																																																					
			Bit 1 "Trq ModeStop" – Configures stopping behavior when in torque mode. 0 = remain in torque mode, 1 = switch to speed mode																																																					
			Bit 2 "Trq ModeJog" – Configures jogging behavior when in torque mode. 0 = remain in torque mode, 1 = switch to speed mode																																																					
			Bit 3 "EnclsTrqProv" – Enables encoderless mode when using the torque prove function. 0 = Disabled, 1 = Enabled. Bits 0 and 1 of P1100 [Trq Prove Cfg] must also be set to use this mode.																																																					
			Bit 4 "Mtr Lead Rev" – Reverses the phase rotation of the applied voltage, effectively reversing the motor leads. 0 = Not Reversed, 1 = Reversed																																																					
			Bit 5 "Reflect Wave" – Enables reflected wave voltage protection for long motor cables. 0 = Disabled, 1 = Enabled																																																					
			Bit 6 "RS Adaption" – Adapts for changes in motor stator resistance due to motor temperature. Active only in FV motor control mode with feedback. 0 = Disabled, 1 = Enabled																																																					
			Bit 7 "PWM Type Sel" – Configures 3 Phase / 2 Phase switching of the power devices. 0 = 3 Phase modulation with auto switchover to 2 phase modulation. 1 = Full time 3 phase modulation (no switchover)																																																					
			Bit 8 "AsyncPWMLock" – Configures Synchronous / Asynchronous switching of the power devices. 0 = Automatically changes between synchronous and asynchronous. 1 = Synchronous switching only.																																																					
			Bit 9 "PWM FreqLock" – Configures switching frequency of the power devices while in FV motor control mode without feedback. 0 = switching frequency automatically reduces to 2 kHz at low speeds (best performance), 1 = switching frequency does not reduce (setting used when switching frequency reduction is undesirable)																																																					
			Bit 10 "DB WhileStop" – Enables operation of the dynamic brake transistor while the drive is stopped. 0 = Disabled, 1 = Enabled																																																					
			Bit 11 "Elect Stab" – Enables stability control for Sensorless Vector and V/Hz motor control modes. 0 = Disabled, 1 = Enabled																																																					
			Bit 12 "Xsistor Diag" – Enables power transistor diagnostic test at each start command. 0 = Disabled, 1 = Enabled																																																					
			Bit 15 "Jerk Select" – Limits the rate of change to the velocity reference for improved current limiting. This setting applies only to Sensorless Vector and V/Hz motor control modes. 0 = Disabled (0.0 second ramp time achievable), 1 = Enabled (0.0 second ramp time prevented)																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Mtr Ctrl Options	42	Bus Utilization Bus Utilization The maximum allowed bus voltage utilization for the Motor Control. Do not change this value without consulting Technical Support. Higher values may result in control instability or over-current faults.	Units: % Default: 95.00 Min/Max: 85.00 / 100.00	RW	Real
		43	Flux Up Enable Flux Up Enable "Manual" (0) – Flux is established for P44 [Flux Up Time] before acceleration. "Automatic" (1) – Flux is established for a calculated time period based on motor nameplate data before acceleration. P44 [Flux Up Time] is not used.	Default: 1 = "Automatic" Options: 0 = "Manual" 1 = "Automatic"	RW	32-bit Integer
		44	Flux Up Time Flux Up Time The amount of time the drive will use to try to achieve full motor stator flux. When a Start command is issued, DC current at P26 [Motor NP Amps] level is used to build stator flux before accelerating.	Units: Secs Default: 0.0000 Min/Max: 0.0000 / 5.0000	RW	Real
		45	Flux Down Ki Flux Down Ki The integral term used in the voltage regulator which controls the removal of flux in the motor.	Default: 0.20 Min/Max: 0.00 / 100.00	RW	Real
		46	Flux Down Kp Flux Down Kp The proportional term used in the voltage regulator which controls the removal of flux in the motor.	Default: 150.0 Min/Max: 0.0 / 10000.0	RW	Real
		47	Econ At Ref Ki Economize At Reference Ki Integral gain that determines the response of the output voltage when P35 [Motor Ctrl Mode] option 2 "Induct Econ" is selected and the output frequency is at its reference.	Default: 305.0 Min/Max: 0.0 / 100000.0	RW	Real
		48	Econ AccDec Ki Economize Acceleration/Deceleration Ki Integral gain that determines the response of the output voltage when P35 [Motor Ctrl Mode] option 2 "Induct Econ" is selected and the output frequency is either accelerating or decelerating to a reference.	Default: 200.0 Min/Max: 0.0 / 100000.0	RW	Real
		49	Econ AccDec Kp Economize Acceleration/Deceleration Kp Proportional gain that determines the response of the output voltage when P35 [Motor Ctrl Mode] option 2 "Induct Econ" is selected and the output frequency is either accelerating or decelerating to a reference.	Units: V/A Default: 100.0 Min/Max: 0.0 / 1000000.0	RW	Real
		50	Stability Filter Stability Filter The filter time constant for the angle and voltage stability control.	Units: Secs Default: 5162.22 Min/Max: 0.00 / 1000000.00	RW	Real
		51	Stab Volt Gain Stability Voltage Gain The gain of the voltage stability control function. Not active when any FV motor control mode is selected with speed feedback.	Default: 5322.22 Min/Max: 0.00 / 10000000.00	RW	Real
		52	Stab Angle Gain Stability Angle Gain The gain of the electrical angle stability control function. Not active when any FV motor control mode is selected in P35 [Motor Ctrl Mode] with speed feedback.	Default: 790.43 Min/Max: 0.00 / 10000000.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Volts per Hertz	60	Start Acc Boost Start/Acceleration Boost The voltage boost level for starting and acceleration when a “VHz” mode is selected, according to P35 [Motor Ctrl Mode]. Refer to diagram for P524 [Overspeed Limit].	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / Based on Drive Rating	RW	Real
		61	Run Boost Run Boost The boost level for steady state and deceleration when a “VHz” mode is selected, according to P35 [Motor Ctrl Mode]. Refer to diagram for P524 [Overspeed Limit].	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / Based on Drive Rating	RW	Real
		62	Break Voltage Break Voltage The voltage the drive will output at P63 [Break Frequency] when a “VHz” mode is selected, according to P35 [Motor Ctrl Mode]. Refer to diagram for P524 [Overspeed Limit].	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / P25 [Motor NP Volts] x 1.5	RW	Real
		63	Break Frequency Break Frequency The frequency the drive will output at P62 [Break Voltage] when a “VHz” mode is selected, according to P35 [Motor Ctrl Mode]. Refer to diagram for P524 [Overspeed Limit].	Units: Hz Default: P27 [Motor NP Hertz] x 0.25 Min/Max: 0.00 / P27 [Motor NP Hertz]	RW	Real
		64	SVC Boost Filter SVC Boost Filter The voltage boost filter time constant when a “SVC” mode is selected, according to P35 [Motor Ctrl Mode].	Units: Secs Default: 0.1000 Min/Max: 0.0001 / 1000.0000	RW	Real
		65	VHz Curve VHz Curve  Selects either a predefined curve (e.g. Fan/Pump), or a custom curve when a “VHz” mode is selected, according to P35 [Motor Cntl Mode]. Refer to diagram for P524 [Overspeed Limit].	Default: 0 = “Custom V/Hz” Options: 0 = “Custom V/Hz” 1 = “Fan/Pump”	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Autotune	70	<p> Autotune Autotune</p> <p>Provides a manual or automatic method for setting P73 [IR Voltage Drop], P74 [Ixo Voltage Drop] and P75 [Flux Current Ref]. Valid only when parameter P35 [Motor Ctrl Mode] is set to 1 "Induction SV", 2 "Induct Econ", or 3 "Induction FV".</p> <p>"Ready" (0) – Parameter returns to this setting following a "Static Tune" or "Rotate Tune", at which time another start transition is required to operate the drive in normal mode. It also permits manually setting P73 [IR Voltage Drop], P74 [Ixo Voltage Drop] and P75 [Flux Current Ref].</p> <p>"Calculate" (1) – Uses motor nameplate data to automatically set P73 [IR Voltage Drop], P74 [Ixo Voltage Drop], P75 [Flux Current Ref] and P621 [Slip RPM @ FLA].</p> <p>"Static Tune" (2) – A temporary command that initiates a non-rotational motor stator resistance test for the best possible automatic setting of P73 [IR Voltage Drop] in all valid modes and a non-rotational motor leakage inductance test for the best possible automatic setting of P74 [Ixo Voltage Drop] in a Flux Vector (FV) mode. A start command is required following initiation of this setting. Used when motor cannot be rotated.</p> <p>"Rotate Tune" (3) – A temporary command that initiates a "Static Tune" followed by a rotational test for the best possible automatic setting of P75 [Flux Current Ref]. In Flux Vector (FV) mode, with encoder feedback, a test for the best possible automatic setting of P621 [Slip RPM @ FLA] is also run. A start command is required following initiation of this setting. Important: If using rotate tune for a Sensorless Vector (SV) mode, the motor should be uncoupled from the load or results may not be valid. With a Flux Vector (FV) mode, either a coupled or uncoupled load will produce valid results.</p> <hr/> <p> ATTENTION: Rotation of the motor in an undesired direction can occur during this procedure. To guard against possible injury and/or equipment damage, it is recommended that the motor be disconnected from the load before proceeding.</p> <hr/> <p>"Inertia Tune" (4) – A temporary command that initiates an inertia test of the motor/load combination. The motor will ramp up and down while the drive measures the amount of inertia.</p>	Default: 1 = "Calculate" Options: 0 = "Ready" 1 = "Calculate" 2 = "Static Tune" 3 = "Rotate Tune" 4 = "Inertia Tune"	RW	32-bit Integer
		71	<p> Autotune Torque Autotune Torque</p> <p>The motor torque applied to the motor during the flux current and inertia tests.</p>	Units: % Default: 50.00 Min/Max: 0.00 / 200.00	RW	Real
		73	<p> IR Voltage Drop IR Voltage Drop</p> <p>Value of voltage drop across the resistance of the motor stator at rated motor current. Used only when P35 [Motor Ctrl Mode] is set to 1 "Induction SV", 2 "Induct Econ", or 3 "Induction FV".</p>	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / Based on Drive Rating	RW	Real
		74	<p> Ixo Voltage Drop Ixo Voltage Drop</p> <p>Value of voltage drop across the leakage inductance of the motor at rated motor current. Used only when P35 [Motor Ctrl Mode] is set to 1 "Induction SV", 2 "Induct Econ", or 3 "Induction FV".</p>	Units: VAC Default: P25 [Motor NP Volts] x 0.25 Min/Max: 0.00 / P25 [Motor NP Volts]	RW	Real
		75	<p> Flux Current Ref Flux Current Reference</p> <p>Value of amps for full motor flux.</p>	Units: Amps Default: P26 [Motor NP Amps] x 0.35 Min/Max: 0.00 / P26 [Motor NP Amps] x 0.995	RW	Real
		76	<p> Total Inertia Total Inertia</p> <p>Time in seconds for a motor coupled to a load to accelerate from zero to base speed at rated motor torque. Calculated during auto-tune.</p>	Units: Secs Default: 2.00 Min/Max: 0.01 / 600.00	RW	Real
		77	<p> Inertia Test Lmt Inertia Test Limit</p> <p>Maximum number of revolutions the motor rotates during the Inertia AutoTune test. When the value is zero, the limit is not active.</p>	Units: Revs Default: 0.0 Min/Max: 0.0 / 65535.0	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																			
MOTOR CONTROL	Autotune	78	EncdrIss AngComp Encoderless Angle Compensation Represents electrical angle compensation dependent on motor cable and PWM Frequency. Determined during autotuning when P35 [Motor Ctrl Mode] is set to one of the FV modes without speed feedback.	Units: Rad Default: 0.0000 Min/Max: -/+6.2831.0000	RW	Real																																																			
		79	EncdrIss VltComp Encoderless Voltage Compensation Represents voltage compensation dependent on motor cable and PWM Frequency. Determined during autotuning when P35 [Motor Ctrl Mode] is set to one of the FV modes without speed feedback.	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / P25 [Motor NP Volts] x 0.25	RW	Real																																																			
		80	755 PM Cfg Permanent Magnet Motor Configuration  This parameter includes two options for PM FV mode selected by P35 [Motor Ctrl Mode]. When Bit 0 = 1 - PM Offset test will be executed before the drive runs normal operation only after a power cycle or drive reset. When Bit 1 = 1 - Vqs regulator will be enabled. Options <table border="1" style="margin-left: 20px;"> <tr> <td></td> <td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Vqs Reg En</td><td>AutoOfstTest</td> </tr> <tr> <td>Default</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>Bit</td> <td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td> </tr> </table>		Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Vqs Reg En	AutoOfstTest	Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / P25 [Motor NP Volts] x 0.25	RW	Real

		81	755 PM PriEnc Offset Permanent Magnet Motor Primary Encoder Offset The amount of offset between the primary feedback encoder counts, and the rotor flux center position of the PM motor. A value of 1024 is equal to 360 electrical degrees. This parameter is updated during the PM Offset test which runs at the first start after a power cycle/ system reset (P80 [PM Cfg] Bit 0 = 1) and during autotune in PM FV mode.	Default: 0 Min/Max: 0 / 1023	RW	32-bit Integer																																																			
		82	755 PM AltEnc Offset Permanent Magnet Motor Alternate Encoder Offset The amount of offset between the alternate feedback encoder counts, and the rotor flux center position of the PM motor. A value of 1024 is equal to 360 electrical degrees. This parameter is updated during the PM Offset test which runs at the first start after a power cycle/ system reset (P80 [PM Cfg] Bit 0 = 1) and during autotune in PM FV mode. Active only when Alternate Velocity Feedback is being used during Auto Tach Loss Switchover (see P635 [Spd Options Ctrl]).	Default: 0 Min/Max: 0 / 1023	RW	32-bit Integer																																																			
		83	755 PM OfstTst Cur  Permanent Magnet Motor Offset Test Current Amplitude of the current command in per unit of the motor rated current during the PM Offset Test, which is one of the auto tune tests in PM FV mode.	Units: % Default: 40.00 Min/Max: 0.00 / 200.00	RW	Real																																																			
		84	755 PM OfstTst CRamp  Permanent Magnet Motor Offset Test Current Ramp Ramp time of the current command during the PM Offset Test in PM FV mode, which is defined as ramp time to reach the P80 [PM Cfg] current command amplitude.	Units: Secs Default: 3.00 Min/Max: 0.00 / 100.00	RW	Real																																																			
85	755 PM OfstTst FRamp  Permanent Magnet Motor Offset Test Frequency Ramp Defines the frequency ramp time of the current command during the PM Offset Test in PM FV mode, which is defined as ramp time in seconds from 0 to 3 Hz.	Units: Secs Default: 60.00 Min/Max: 0.00 / 1000.00	RW	Real																																																					
86	755 PM CEMF Voltage Permanent Magnet Motor Counter Electro Motive Force Counter electromotive force (CEMF) voltage displayed in line-to-line rms value, which is normalized to the base motor speed. Updated after the completion of the auto tune in PM FV mode.	Units: VAC Default: P25 [Motor NP Volts] x 0.0675 Min/Max: 0.00 / P25 [Motor NP Volts] x 1.5	RW	Real																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Autotune	87	755 PM IR Voltage Permanent Magnet Motor Stator Voltage Drop Voltage across the stator resistance of the PM motor at the rated motor current displayed in line-to-line rms value. Updated after the completion of the auto tune in PM FV mode.	Units: VAC Default: Based on Drive Rating Min/Max: 0.00 / P25 [Motor NP Volts] x 0.25	RW	Real
		88	755 PM IXq Voltage Permanent Magnet Motor Q-Axis Stator Inductance Voltage Drop Voltage across the q-axis stator inductance of the PM motor at the rated motor current and the rated motor frequency displayed in line-to-line rms value. This parameter is updated after the completion of the auto tune in PM FV mode.	Units: VAC Default: P25 [Motor NP Volts] x 0.0435 Min/Max: 0.00 / P25 [Motor NP Volts] x 1.5	RW	Real
		89	755 PM IXd Voltage Permanent Magnet Motor D-Axis Stator Inductance Voltage Drop Voltage across the d-axis stator inductance of the PM motor at the rated motor current and the rated motor frequency displayed in line-to-line rms value. Updated after the completion of the auto tune in PM FV mode.	Units: VAC Default: P25 [Motor NP Volts] x 0.0435 Min/Max: 0.00 / P25 [Motor NP Volts] x 1.5	RW	Real
		91	755 PM Vqs Reg Kp Permanent Magnet Motor Vqs Regulator Proportional Gain Proportional gain of the vqs regulator in PM FV mode. When P80 [PM Cfg] Bit 1 = 1, the vqs regulator will be active either when the motor voltage exceeds the voltage limited by the DC bus voltage or when the motor voltage exceeds the value set by P36 [Maximum Voltage].	Default: 2.50 Min/Max: 0.00 / 1000.00	RW	Real
		92	755 PM Vqs Reg Ki Permanent Magnet Motor Vqs Regulator Integral Gain Integral gain of the vqs regulator in PM FV mode.	Default: 0.50 Min/Max: 0.00 / 1000.00	RW	Real
		93	755 PM Dir Test Cur Permanent Magnet Motor Direction Test Current Amount of current commanded during the direction test when P35 [Motor Ctrl Mode] option 6 "PM FV" is selected. When the Start-Up feature is used, this value is automatically set to 10% of the motor rated current.	Units: Amps Default: P26 [Motor NP Amps]/10 Min/Max: 0.00 / P26 [Motor NP Amps]	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Vector Regulator	95	VCL Cur Reg BW Vector Closed Loop Current Regulator Bandwidth Sets the bandwidth of the current regulator by automatically adjusting the gains (P96 and P97) based on motor autotune results. When the value of bandwidth is zero (default) the current regulator gains can be manually adjusted. The default values for P95, P96, and P97 typically provide excellent performance, and do not normally need to be adjusted.	Units: R/S Default: 0.0 Min/Max: 0.0 / 9999.0	RW	Real
		96	VCL Cur Reg Kp Vector Closed Loop Current Regulator Proportional Gain Proportional gain of the current regulator. Can be adjusted when P95 is set to zero. The default values for P95, P96, and P97 typically provide excellent performance, and do not normally need to be adjusted.	Default: 1250.0 Min/Max: 0.0 / 10000.0	RW	Real
		97	VCL Cur Reg Ki Vector Closed Loop Current Regulator Integral Gain Integral gain of the current regulator. Can be adjusted when P95 is set to zero. The default values for P95, P96, and P97 typically provide excellent performance, and do not normally need to be adjusted.	Default: 60.0 Min/Max: 0.0 / 10000.0	RW	Real
		98	VEncdls FReg Kp Encoderless Vector Frequency Regulator Proportional Gain Represents electrical angle compensation dependent on motor cable and PWM Frequency. Determined during autotuning when P35 [Motor Ctrl Mode] is set to one of the FV modes without speed feedback.	Units: Hz/A Default: 524.0 Min/Max: 0.0 / 100000.0	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Vector Regulator	99	VEncdls FReg Ki Encoderless Vector, Frequency Regulator Integral Gain Determined during autotuning when P35 [Motor Ctrl Mode] is set to one of the FV modes without speed feedback. Represents voltage compensation dependent on motor cable and PWM Frequency.	Units: Hz/A Default: 9080.0 Min/Max: 0.0 / 100000.0	RW	Real
		100	Slip Reg Enable Slip Regulator Enable Enables or disables the slip frequency regulator. This selection is active only in motor control mode flux vector induction (P35 [Motor Cntl Mode] = 3 "Induction FV") and encoder feedback is used.	Default: 1 = "Enabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer
		101	Slip Reg Ki Slip Regulator Integral Gain Integral gain for the slip frequency regulator.	Default: 10.00 Min/Max: 0.00 / 10000.00	RW	Real
		102	Slip Reg Kp Slip Regulator Proportional Gain Proportional gain for the slip frequency regulator.	Default: 0.50 Min/Max: 0.00 / 10000.00	RW	Real
		103	Flux Reg Enable Flux Regulator Enable Enables or disables the flux regulator. This selection is active only in motor control mode flux vector induction (P35 [Motor Cntl Mode] = 3 "Induction FV").	Default: 1 = "Enabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer
		104	Flux Reg Ki Flux Regulator Integral Gain Integral gain for the flux regulator.	Default: 30.00 Min/Max: 0.00 / 10000.00	RW	Real
		105	Flux Reg Kp Flux Regulator Proportional Gain Proportional gain for the flux regulator.	Default: 1.00 Min/Max: 0.00 / 10000.00	RW	Real
		106	Trq Adapt Speed Torque Adaption Speed Operating frequency (speed) at which the adaptive torque control regulators become active as a percent of motor nameplate frequency. This selection is active only in motor control mode flux vector induction (P35 [Motor Cntl Mode] = 3 "Induction FV").	Units: % Default: 10.00 Min/Max: 0.00 / 100.00	RW	Real
		107	Trq Adapt En Torque Adaption Enable Enables or disables the adaptive torque control. This selection is active only in motor control mode flux vector induction (P35 [Motor Cntl Mode] = 3 "Induction FV").	Default: 1 = "Enabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer
		108	Phase Delay Comp Phase Delay Compensation Used to adjust the sample delay compensation gain for the current feedback. The gain compensation is scaled to the sample time (for example, +1.0 would be a compensation of positive 1 sample time).	Units: % Default: 0.00 Min/Max: +/-100.00	RW	Real
		109	Trq Comp Mode Torque Compensation Mode Automatic: Updates the torque compensation gains (P110 [Trq Comp Mtring] and P111 [Torque Comp Regen]) after autotune.	Default: 1 = "Auto" Options: 0 = "Manual" 1 = "Auto"	RW	32-bit Integer
110	Trq Comp Mtring Torque Compensation Motoring Motor torque compensation applied to the torque command for motoring power. This parameter can be set manually or determined automatically during autotune. (See P109 [Trq Comp Mode].) In manual mode, a value of 5% will increase the commanded torque by 5% (gain of 1.05). This is used for flux vector motor control mode (P35 [Motor Ctrl Mode] = 3 "Induction FV").	Units: % Default: 0.00 Min/Max: +/-50.00	RW	Real		

File	Group	No.	Name Description	Values	Read-Write	Data Type
MOTOR CONTROL	Vector Regulator	111	Trq Comp Regen Torque Compensation Regeneration Motor torque compensation applied to the torque command for regenerating torque. This parameter can be set manually or determined automatically during autotune. (See P109 [Trq Comp Mode].) In manual mode, a value of -3% will decrease the commanded torque by 3% (gain of 0.97). This is used for flux vector motor control modes (P35 [Motor Ctrl Mode]).	Units: % Default: 0.00 Min/Max: -/+50.00	RW	Real
		112	Slip Adapt Iqs Slip Adaption Iqs Level of per unit Iqs at which the adaptive slip frequency regulator becomes active. Active only in motor control mode flux vector induction (P35 [Motor Ctrl Mode] = 3 "Induction FV").	Default: 0.05 Min/Max: 0.00 / 1.00	RW	Real
		113	SFAdapt SlewLmt Slip and Flux Adaption Slew Limit Time that the slip, flux, and torque regulators are allowed to converge before the regulators are turned on after the motor speed reaches the level set in P106 [Trq Adapt Speed].	Units: Secs Default: 0.00 Min/Max: 0.00 / 60.00	RW	Real
		114	SFAdapt SlewRate Slip and Flux Adaption Slew Rate Rate that the slip and flux regulators can converge before the regulators are enabled.	Default: 0.005000 Min/Max: 0.000010 / 1.000000	RW	Real
		115	SFAdapt CnvrgLvl Slip and Flux Adaption Converge Level Slip and flux regulator error level that indicates convergence.	Default: 0.010000 Min/Max: 0.000010 / 1.000000	RW	Real
		116	SFAdapt CnvrgLmt Slip and Flux Adaption Converge Limit Duration of convergence before the adaption regulators are enabled after the error has decreased below the level set in P115 [SFAdapt CnvrgLvl].	Default: 0.500 Min/Max: 0.000 / 5.000	RW	Real

Drive Feedback & I/O File

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Feedback	125	Pri Vel Fdbk Sel  Primary Velocity Feedback Select Selects the source of the P3 [Mtr Vel Fdbk] and P131 [Active Vel Fdbk] that will be used when the drive is in operation without an Auto Tach Loss Switchover. Possible selections include: Port 0 – Open Loop Fdbk, Port 0 – Simulator Fdbk, and any Port that contains a feedback module (for example, Encoder). The Disabled and Open Loop Fdbk selections are functionally equivalent, with Open Loop being the default setting. Open Loop velocity feedback is estimated based on P1 [Output Frequency] and P5 [Torque Cur Fdbk], adjusted using P621 [Slip RPM @ FLA]. Simulator Fdbk is available in the Flux Vector selections for P35 [Motor Ctrl Mode]. Simulator velocity feedback is calculated based on P690 [Limited Trq Ref] and P76 [Total Inertia]. This selection is useful for drive operational checkout and test when motor movement is undesired. In simulation mode, gating of the power inverter section of the drive is disabled. Selection of any option module port that contains an encoder module results in P3 [Mtr Vel Fdbk] based on a measured value. Data obtained from the selected feedback module will be used to determine motor velocity feedback.	Default: 137 Min/Max: 0 / 159999	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Feedback	126	Pri Vel FdbkFiltr Primary Velocity Feedback Filter Adjusts a filter setting that is applied to the motor velocity feedback source that is selected by P125 [Pri Vel Fdbk Sel]. The purpose of this filter is to reduce the level of noise in the feedback signal. This is moving average type filter that has a delay setting of N, where N is an integer number (0, 1, 2 ...). A setting of zero provides no filtering and no delay. Larger values of N result in more filtering and more delay. The best setting for this filter depends on the level of noise in the feedback signal and the bandwidth setting of the velocity regulator. In the Flux Vector selections for P35 [Motor Ctrl Mode], setting P636 [Speed Reg BW] to a non-zero setting places the drive in an automatic gain/filter adjustment mode. When the drive is in this automatic adjustment mode, the value of P666 [Speed Comp Gain] and possibly P644 [Spd Err Filt BW] are adjusted, based on the setting of P126 [Pri Vel FdbkFiltr]. The automatic setting of P644 [Spd Err Filt BW] becomes independent of the feedback filter setting when P704 [InAdp LdObs Mode] is set to 1 "InertiaAdapt."	Default: 3 = "50R/S Noise" Options: 0 = "190R/S Noise" 1 = "160R/S Noise" 2 = "100R/S Noise" 3 = "50R/S Noise" 4 = "25R/S Noise" 5 = "12R/S Noise" 6 = "6R/S Noise" 7 = "3R/S Noise"	RW	32-bit Integer
		127	Pri Vel Feedback Primary Velocity Feedback Output of the Primary Velocity Feedback Delay filter, in units of Hz or RPM, depending on the value of P300 [Speed Units]. Adjustment of the delay filter is made using P126 [Pri Vel FdbkFiltr]. The Primary Velocity Feedback is used when the drive is operating without an auto Tach Loss Switchover.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		128	 Alt Vel Fdbk Sel Alternate Velocity Feedback Select Selects the source of the P3 [Mtr Vel Fdbk] and P131 [Active Vel Fdbk] to be used when the drive is in operation with an auto Tach Loss Switchover.	Default: 137 Min/Max: 0 / 159999	RW	32-bit Integer
		129	Alt Vel FdbkFiltr Alternate Velocity Feedback Filter Adjusts a filter setting that is applied to the motor velocity feedback source that is selected by P128 [Alt Vel Fdbk Sel]. The purpose of this filter is to reduce the level of noise in the feedback signal. Filter adjustment and operation is similar to P126 [Pri Vel FdbkFiltr].	Default: 3 = "50R/S Noise" Options: 0 = "190R/S Noise" 1 = "160R/S Noise" 2 = "100R/S Noise" 3 = "50R/S Noise" 4 = "25R/S Noise" 5 = "12R/S Noise" 6 = "6R/S Noise" 7 = "3R/S Noise"	RW	32-bit Integer
		130	Alt Vel Feedback Alternate Velocity Feedback Output of the Alternate Velocity Feedback Delay filter, displayed in units of Hz or RPM, depending on the value of P300 [Speed Units]. Adjustment of the delay filter is made using P126 [Pri Vel FdbkFiltr]. The Alternate Velocity Feedback is used when the drive is operating with an auto Tach Loss Switchover.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		131	Active Vel Fdbk Active Velocity Feedback Active motor velocity feedback value that used by the Flux Vector control's velocity regulator. This value in use is the result of the Primary/Alternate feedback selection. When the drive is operating without an auto Tach Loss Switchover, then P127 [Pri Vel Feedback] is selected. When the drive is operating with an auto Tach Loss Switchover, then the P130 [Alt Vel Feedback] will be selected. Status Bit 5 "FdbkLoss SwO" will become set in P936 [Drive Status 2] when an Auto Tach Switchover has occurred.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		132	 Aux Vel Fdbk Sel Auxiliary Velocity Feedback Select Selects the source of the drive's P134 [Aux Vel Feedback]. Possible selections are the same as for P125 [Pri Vel Fdbk Sel].	Default: 137 Min/Max: 0 / 159999	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Feedback	133	Aux Vel FdbkFiltr Auxiliary Velocity Feedback Filter Adjusts a filter setting that is applied to the P134 [Aux Vel Feedback] that is selected by P132 [Aux Vel Fdbk Sel]. The purpose of this filter is to reduce the level of noise present in the feedback signal. Filter adjustment and operation is similar to P126 [Pri Vel FdbkFiltr].	Default: 3 = "50R/S Noise" Options: 0 = "190R/S Noise" 1 = "160R/S Noise" 2 = "100R/S Noise" 3 = "50R/S Noise" 4 = "25R/S Noise" 5 = "12R/S Noise" 6 = "6R/S Noise" 7 = "3R/S Noise"	RW	32-bit Integer
		134	Aux Vel Feedback Auxiliary Velocity Feedback Output of the Auxiliary Velocity Feedback Delay filter, in units of Hz or RPM, depending on the value of P300 [Speed Units]. Adjustment of the delay filter is made using P126 [Pri Vel FdbkFiltr]. Typically used as a speed reference source. This selection is available in P545 [Spd Ref A Sel] and P550 [Spd Ref B Sel].	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		135	 Mtr Psn Fdbk Sel Motor Position Feedback Select Selects the source of P847 [Psn Fdbk]. Possible selections include: Port 0 – Simulator Fdbk, and any Port that contains a feedback module (for example, Encoder). Open Loop Feedback is not available as a Position feedback source. The default setting is P138 [Simulator Fdbk]. This is a test mode where position feedback is calculated based on P690 [Limited Trq Ref] and P76 [Total Inertia]. When position control is used, a valid position feedback source must be selected.	Default: 138 Min/Max: 0 / 159999	RW	32-bit Integer
		136	 755 Load Psn FdbkSel Load Position Feedback Select Selects a position load feedback source for the position control. The position load feedback P847 [Psn Fdbk] indicates the selected position feedback value. The value forms the primary feedback for the position regulator integration channel.	Default: 137 Min/Max: 0 / 159999	RW	32-bit Integer
		137	Open Loop Fdbk Open Loop Feedback An estimated motor feedback source that is available to any of the Velocity Feedback Selection parameters – P125 [Pri Vel Fdbk Sel], P128 [Alt Vel Fdbk Sel], and P132 [Aux Vel Fdbk Sel]. Open Loop Feedback is not available as a Position feedback source. The Open Loop Feedback's parameter value has units of encoder counts as established by P141 [Virtual Enc EPR]. Open Loop feedback is estimated based on P1 [Output Frequency] and P5 [Torque Cur Fdbk], adjusted using P621 [Slip RPM @ FLA].	Default: 0 Options: -2147483648 / 2147483647	RO	32-bit Integer
		138	Simulator Fdbk Simulator Feedback Simulator Feedback is a calculated motor feedback source. It can be used when operating in any of the Flux Vector control modes that are selected in P35 [Motor Ctrl Mode]. Simulator Feedback is available to any of the Velocity Feedback Selection parameters: P125 [Pri Vel Fdbk Sel], P128 [Alt Vel Fdbk Sel], and P132 [Aux Vel Fdbk Sel]. Simulator Feedback is also available as a Position feedback source as selected by P135 [Mtr Psn Fdbk Sel]. The Simulator Feedback's parameter value has units of encoder counts, as established by P141 [Virtual Enc EPR]. Simulator velocity feedback is calculated based on P690 [Limited Trq Ref] and P76 [Total Inertia]. This selection is useful for drive operational checkout and test when motor movement is undesired. In simulation mode, gating of the power inverter section of the drive is disabled.	Default: 0 Options: -2147483648 / 2147483647	RO	32-bit Integer
		139	 755 Delayed Spd Ref Delayed Speed Reference One sample period delayed output of P594 [Ramped Spd Ref]. Used in some applications to synchronize the speed reference value when controlling multiple drives. In these applications, the drive that supplies the master speed reference would use the [Delayed Spd Ref] value. Setting P635 [Spd Options Ctrl] Bit 8 "Delayed Ref" will select the delayed reference in the master drive. P594 [Ramped Spd Ref] would then be transmitted to the slave drives over a communication link.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Feedback	140	755 Virtual EncDelay Virtual Encoder Delay One sample period delayed output of P142 [Virtual Enc Psn]. Used in some applications to phase synchronize position reference through a drive communications link. The master is delayed one sample while the downstream drives update their position references – then all drives sample position simultaneously. The downstream drives do not select a delay. The selection of the delayed or non-delayed position reference is made by choosing the desired parameter in P766 [Psn Direct Stpt].	Default: 0 Options: -2147483648 / 2147483647	RO	32-bit Integer
		141	755 Virtual Enc EPR Virtual Encoder Edges Per Revolution Equivalent Edges Per Revolution (EPR) or line count of a virtual encoder. A virtual encoder is a position reference whose input is derived from the speed reference. It accumulates pulses at the same rate as a real encoder of identical Pulses Per Revolution (PPR). Enter the equivalent PPR. For example, enter 1024 PPR to match an encoder with 1024 EPR.	Default: 4096 Min/Max: 10 / 67108864	RW	32-bit Integer
		142	755 Virtual Enc Psn Virtual Encoder Position A 32 bit pulse accumulator of the virtual encoder. The accumulated pulse count is equivalent to the hardware accumulator of a real encoder. It accumulates at a rate of 4x the value placed in P141 [Virtual Enc EPR]. The accumulator starts at zero upon position enable.	Default: 0 Min/Max: -/+32767	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type	
FEEDBACK & I/O	Digin Functions	150	 Digital In Cfg Digital Input Configure Defines operation for DI Run type parameters. “Run Edge” (0) – Control function requires a rising edge (open to close transition) in order for the drive to run. “Run Level” (1) – As long as a separate “Stop” command is not issued, the level alone (no rising edge required) determines whether or not the drive will run.	Default: 0 = “Run Edge” Options: 0 = “Run Edge” 1 = “Run Level”	RW	32-bit Integer	
		 ATTENTION: Equipment damage and/or personal injury may result if this parameter is used in an inappropriate application. Do not use this function without considering applicable local, national and international codes, standards, regulations, or industry guidelines.					
		155	 DI Enable Digital Input Enable Assigns a digital input used to enable the drive.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer	
		156	 DI Clear Fault Digital Input Clear Fault Assigns a digital input used to clear faults.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer	
		157	 DI Aux Fault Digital Input Auxiliary Fault Assigns a digital input used to force an external auxiliary fault.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer	
		158	 DI Stop Digital Input Stop Assigns a digital input used to issue a stop command.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer	
		159	 DI Cur Lmt Stop Digital Input Current Limit Stop Assigns a digital input used to perform a current limited stop.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer	

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Digin Functions	160	DI Coast Stop Digital Input Coast Stop Assigns a digital input used to perform a coast-to-stop.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		161	DI Start Digital Input Start Assigns a digital input used to start the drive (3-wire control).	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		162	DI Fwd Reverse Digital Input Forward Reverse Assigns a digital input used to command reverse direction.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		163	DI Run Digital Input Run Assigns a digital input used to run the drive (2-wire control).	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		164	DI Run Forward Digital Input Run Forward Assigns a digital input used to run the drive (2 wire control) and command forward direction.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		165	DI Run Reverse Digital Input Run Reverse Assigns a digital input used to run the drive (2 wire control) and command reverse direction.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		166	DI Jog 1 Digital Input Jog 1 Assigns a digital input used to jog the drive at the speed of P556 [Jog Speed 1].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		167	DI Jog 1 Forward Digital Input Jog 1 Forward Assigns a digital input used to jog the drive in the forward direction at the speed of P556 [Jog Speed 1].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		168	DI Jog 1 Reverse Digital Input Jog 1 Reverse Assigns a digital input used to jog the drive in the reverse direction at the speed of P556 [Jog Speed 1].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		169	DI Jog 2 Digital Input Jog 2 Assigns a digital input used to jog the drive at the speed of P557 [Jog Speed 2].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		170	DI Jog 2 Forward Digital Input Jog 2 Forward Assigns a digital input used to jog the drive in the forward direction at the speed of P557 [Jog Speed 2].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		171	DI Jog 2 Reverse Digital Input Jog 2 Reverse Assigns a digital input used to jog the drive in the reverse direction at the speed of P557 [Jog Speed 2].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		172	DI Manual Ctrl Digital Input Manual Control Assigns a digital input used to command manual control.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer

		1	1	1	Preset Speed 7			
		177	 DI MOP Inc Digital Input Motor Operated Potentiometer Increment Assigns a digital input used to increment the MOP speed reference.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer		
		178	 DI MOP Dec Digital Input Motor Operated Potentiometer Decrement Assigns a digital input used to decrement the MOP speed reference.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer		
		179	 DI Accel 2 Digital Input Acceleration 2 Assigns a digital input used to activate P536 [Accel Time 2].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer		
		180	 DI Decel 2 Digital Input Deceleration 2 Assigns a digital input used to activate P538 [Decel Time 2].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer		
181 182	 DI SpTqPs Sel 0 DI SpTqPs Sel 1 Digital Input Speed Torque Position Select 0, 1 Assigns digital inputs used to select between speed, torque, and position modes.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
185	 DI Stop Mode B Digital Input Stop Mode B Assigns a digital input used to activate P371 [Stop Mode B].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
186	 DI BusReg Mode B Digital Input Bus Regulation Mode B Assigns a digital input used to activate P373 [Bus Reg Mode B].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
187	 DI PwrLoss ModeB Digital Input Power Loss Mode B Assigns a digital input used to activate P453 [Pwr Loss Mode B].	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
188	 DI Pwr Loss Digital Input Power Loss Assigns a digital input used to force a power loss condition.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
189	 DI Precharge Digital Input Precharge Assigns a digital input used to force the drive into precharge (normally only used in common bus applications).	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				
190	 DI Prchrg Seal Digital Input Precharge Seal Assigns a digital input used to force a unique fault when an external precharge circuit opens.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer				

File	Group	No.	Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Digin Functions	191	 DI PID Enable Digital Input Proportional Integral Derivative Enable Assigns a digital input used to activate the Process PID control.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		192	 DI PID Hold Digital Input Proportional Integral Derivative Hold Assigns a digital input used to hold the Process PID integrator.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		193	 DI PID Reset Digital Input Proportional Integral Derivative Reset Assigns a digital input used to reset the Process PID integrator.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		194	 DI PID Invert Digital Input Proportional Integral Derivative Invert Assigns a digital input used to invert the output of the Process PID control.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		195	 DI Torque StptA Digital Input Torque Setpoint A Assigns a digital input used to force P676 [Trq Ref A Stpt] as the source for Torque Reference A, regardless of the setting in P675 [Trq Ref A Sel]. Used when the drive is in a mode that is commanding torque (see P309...P312).	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		196	 DI Fwd End Limit Digital Input Forward End Limit Assigns a digital input used to trigger a Forward End Limit. The resulting action is to execute a "Fast Stop" command. After the drive stops in this case, it will only restart in the opposite direction. This function is usually used with a limit switch near the point at which the drive should stop.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		197	 DI Fwd Dec Limit Digital Input Forward Deceleration Limit Assigns a digital input used to trigger a Forward Decel Limit. The resulting action is to override the speed reference and decelerate to Preset Speed 1. This function is usually used with a limit switch and initiates the slowing down process prior to encountering the End Limit.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		198	 DI Rev End Limit Digital Input Reverse End Limit Assigns a digital input used to trigger a Reverse End Limit. The resulting action is to execute a "Fast Stop" command. After the drive stops in this case, it will only restart in the opposite direction. This function is usually used with a limit switch near the point at which the drive should stop.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		199	 DI Rev Dec Limit Digital Input Reverse Deceleration Limit Assigns a digital input used to trigger a Reverse Decel Limit. The resulting action is to override the speed reference and decelerate to Preset Speed 1. This function is usually used with a limit switch and initiates the slowing down process prior to encountering the End Limit.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		200	 DI PHdwr OvrTrvl Digital Input Positive Hardware Over Travel Assigns a digital input used to trigger a Positive Hardware Over-travel. The resulting action is to immediately fault and produce zero torque. After the drive stops in this case, the fault will need to be reset, and the drive will only restart in the opposite direction. This function is usually used with a limit switch in a position beyond the "End Limit," as an extra safety limit to prevent torque from damaging the machine in an over-travel situation.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer
		201	 DI NHdwr OvrTrvl Digital Input Negative Hardware Over Travel Assigns a digital input used to trigger a Negative Hardware Over-travel. The resulting action is to immediately fault and produce zero torque. After the drive stops in this case, the fault will need to be reset, and the drive will only restart in the opposite direction. This function is usually used with a limit switch in a position beyond the "End Limit," as an extra safety limit to prevent torque from damaging the machine in an over-travel situation.	Default: 0 Min/Max: 0 / 159999.15	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
DRIVE CFG	Preferences	300	Speed Units  Speed Units Selects the units to be used for all speed related parameters. Options 0 and 1 do not convert other parameter values (e.g. a 60 Hz reference becomes 60 rpm). Options 2 and 3 perform an automatic conversion of other parameter values (e.g. a 60 Hz reference becomes 1800 rpm, based on motor nameplate settings). This parameter is only reset when Set Defaults "All" (not recommended) is executed.	Default: Current Selection Options: 0 = "Hz" 1 = "RPM"	RW	32-bit Integer
		301	Access Level Access Level Sets the access level for parameters and option choices. "Basic" (0) – Provides the smallest, simplest, and most user friendly view. "Advanced" (1) – May be required to use advanced features. "Expert" (2) – Not normally recommended (makes the list very long), and shows extra parameters that should rarely be required. When the access level is changed, PC-based tools (e.g. Drive Tools and Drive Explorer) will require a reconnect. This parameter is only reset when Set Defaults "All" (not recommended) is executed.	Default: Current Selection Options: 0 = "Basic" 1 = "Advanced" 2 = "Expert"	RW	32-bit Integer
		302	Language Language Select display language. This parameter is only reset when Set Defaults "All" (not recommended) is executed.	Default: 0 = "Not Used" Options: 0 = "Not Used" 1 = "English" 2 = "French" 3 = "Spanish" 4 = "Italian" 5 = "German" 6 = "Japanese" 7 = "Portuguese" 8 = "Chinese" 9 = "Reserved" 10 = "Reserved" 10 = "Korean"	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type						
DRIVE CFG	Control Cfg	305	<p>Voltage Class Voltage Class</p> <p>Selects the voltage class operation of the drive (e.g. for 400 / 480V drives, "Low Voltage" = 400V, "High Voltage" = 480V). This setting affects how the drive will appear as a node on a system (e.g. 400V or 480V), and also affects the drive's current rating (Rated Amps).</p> <p>This parameter is only reset (to original factory setting) when Set Defaults "All" (not recommended) is executed.</p>	<p>Default: 0 = Based on Factory Setting</p> <p>Options: 0 = "Low Voltage" 1 = "High Voltage"</p>	RW	32-bit Integer						
		306	<p>Duty Rating Duty Rating</p> <p>Selects the continuous and overload capacity of the drive. "Normal Duty" provides the highest continuous rating, but smaller overload ratings (110% for 60 sec, 150% for 3 sec). "Heavy Duty" provides a smaller continuous rating, but larger overload ratings (150% for 60 sec, 180% for 3 sec).</p> <p>This parameter is only reset when Set Defaults "All" (not recommended) is executed.</p>	<p>Default: 0 = "Normal Duty"</p> <p>Options: 0 = "Normal Duty" 1 = "Heavy Duty"</p>	RW	32-bit Integer						
		308	<p>Direction Mode Direction Mode</p> <p>Selects method for changing direction.</p> <table border="1"> <thead> <tr> <th>Mode</th> <th>Direction Change</th> </tr> </thead> <tbody> <tr> <td>Unipolar</td> <td>Drive Logic</td> </tr> <tr> <td>Bipolar</td> <td>Sign of Reference</td> </tr> <tr> <td>Rev Disable</td> <td>Not Changeable</td> </tr> </tbody> </table>	Mode	Direction Change	Unipolar	Drive Logic	Bipolar	Sign of Reference	Rev Disable	Not Changeable	<p>Default: 0 = "Unipolar"</p> <p>Options: 0 = "Unipolar" 1 = "Bipolar" 2 = "Rev Disable"</p>
Mode	Direction Change											
Unipolar	Drive Logic											
Bipolar	Sign of Reference											
Rev Disable	Not Changeable											
			<p> ATTENTION: Enabling the Bipolar Direction Mode can cause unexpected direction changes. Equipment damage and/or personal injury can result if this parameter is used in an inappropriate application. Do Not use this function without considering all applicable local, national, and international codes standards, regulations, or industry guidelines.</p>									

File	Group	No.	Name Description	Values	Read-Write	Data Type
DRIVE CFG	Control Cfg	309	SpdTrqPsn Mode A	Default: 1 = "Speed Reg" Options: 0 = "Zero Torque" 1 = "Speed Reg" 2 = "Torque Reg" 3 = "SLAT Min" 4 = "SLAT Max" 5 = "Sum" 6 = "Profiler" 755 7 = "Psn PTP" 8 = "Psn Camming" 755 9 = "Psn PLL" 755 10 = "Psn Direct"	RW	32-bit Integer
		310	SpdTrqPsn Mode B			
		311	SpdTrqPsn Mode C			
		312	SpdTrqPsn Mode D			
			Speed Torque Position Mode A Applies only to the Flux Vector control modes in P35 [Motor Ctrl Mode]. It selects between speed regulation, torque regulation, or position regulation operation of the drive. The source of P685 [Selected Trq Ref] will be determined by the selection in this parameter when P181 [DI SpTqPs Sel 0] and P182 [DI SpTqPs Sel 1] have selected "Disabled" or selected bits that are logic low. In P935 [Drive Status 1] three bits are provided that indicate the regulation mode of the drive when it is running. Bit 21 "Speed Mode" will become set when the drive is running with the speed regulator active. Similarly, Bit 22 "PositionMode" and Bit 23 "Torque Mode" indicate when their respective regulation modes are active. Under some conditions, the active torque mode may be forced into speed mode regardless of the setting of Speed/Torque/Position. The P313 [Actv SpTqPs Mode] parameter will indicate this and will reflect the mode selection that is in use. Possible selections for Speed/Torque/Position are: "Zero Torque" (0) – Drive operates as a torque regulator with P685 [Selected Trq Ref] forced to a constant value of zero torque. "Speed Reg" (1) – Drive operates as a speed regulator. P685 [Selected Trq Ref] comes from P660 [SReg Output] plus P699 [Inertia Comp Out]. "Torq Ref" (2) – Drive operates as a torque regulator. P685 [Selected Trq Ref] comes from P4 [Commanded Trq]. Under some conditions such as jogging or performing a ramp to stop operation, the drive will automatically bypass this selection and temporarily switch to speed regulation mode. "SLAT Min" (3) – Drive operates in "Speed Limited Adjustable Torque – Minimum select" mode. This is a special mode of operation used primarily in winder applications. The drive will typically operate as a torque regulator, provided that the P4 [Commanded Trq] value is algebraically smaller in value than the speed regulator's output. The drive may automatically enter speed regulation mode, based on conditions within the speed regulator and the magnitude of the speed regulator's output relative to the torque reference. "SLAT Max" (4) – Drive operates in "Speed Limited Adjustable Torque – Maximum select" mode. This is a special mode of operation used primarily in winder applications. The drive will typically operate as a torque regulator, provided that the P4 [Commanded Trq] value is algebraically larger in value than the speed regulator's output. The drive may automatically enter speed regulation mode, based on conditions within the speed regulator and the magnitude of the speed regulator's output relative to the torque reference. "Sum" (5) – Drive operates as a speed regulator. P685 [Selected Trq Ref] comes from P660 [SReg Output] plus torque adders summed with P4 [Commanded Trq]. "Profiler" (6) – Drive uses the Speed Profiler / Position Indexer function. The drive operates as either a speed or position regulator. Mode of operation will depend on the configuration of the Step Types in the Profiler / Indexer table. "Psn PTP" (7) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Point-to-Point mode and uses its Point-to-point position reference. "Psn Camming" (8) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Position CAM mode and uses its PCAM Planner position and speed reference. "Psn PLL" (9) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Position Phase Lock Loop mode and uses its PLL Planner position and speed reference. "Psn Direct" (10) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Direct mode and uses its Direct Position Reference.			

File	Group	No.	Name Description	Values	Read-Write	Data Type
DRIVE CFG	Control Cfg	313	Actv SpTqPs Mode Active Speed Torque Position Mode Displays the Speed, Torque, Position Mode that is active, based on the dynamic selection of modes A, B, C, and D, per P309...P312, and digital input conditions programmed via P181 and P182. In some cases, such as operation in the SLAT min/max modes, the final regulation mode may be forced into Speed Regulation. Refer to the Speed, Torque, and Position mode bits in P935 [Drive Status 1] that indicate the final regulation mode of the drive when it is running.	Default: 1 = "Speed Reg" Options: 0 = "Zero Torque" 1 = "Speed Reg" 2 = "Torque Reg" 3 = "SLAT Min" 4 = "SLAT Max" 5 = "Sum" 6 = "Profiler" 755 7 = "Psn PTP" 8 = "Psn Camming" 755 9 = "Psn PLL" 755 10 = "Psn Direct"	RO	32-bit Integer
		314	SLAT Err Stpt Speed Limited Adjustable Torque, Error Setpoint Sets the magnitude of P641 [Speed Error] at which the SLAT function will release its Forced Speed Mode signal. This condition must exist for the time specified by P315 [SLAT Dwell Time]. Once released, the drive can operate as a torque regulator, depending on the relative levels of P660 [SReg Output] and P4 [Commanded Trq]. This parameter will be entered in units of Hz or RPM, depending on the value of P300 [Speed Units].	Units: Hz RPM Default: 0.00 Min/Max: 0.00 / P27 [Motor NP Hertz] 0.00 / P28 [Motor NP RPM]	RW	Real
		315	SLAT Dwell Time Speed Limited Adjustable Torque, Dwell Time Sets the time period that P641 [Speed Error] must exceed the P314 [SLAT Err Stpt] magnitude in order to return to min/max torque mode.	Units: Secs Default: 0.00 Min/Max: 0.00 / 2.00	RW	Real
		321	Prchrg Control Precharge Control When disabled, the drive will stay in the precharge mode and will not be able to run. When enabled, the normal precharge operation is run. This parameter allows programmable control of the completion of the precharge function and may be used to coordinate the precharge of a system of drives or to reset P12 [DC Bus Memory] in the drive.	Default: 1 = "Enabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer
		322	Prchrg Delay Precharge Delay Adjustable delay between the time all other precharge conditions have been met and the time the drive leaves the precharge state. This can be used to control the sequences of precharge completion in a drive system.	Units: Secs Default: 0.50 Min/Max: 0.10 / 30.00	RW	Real
		323	Prchrg Err Cfg Precharge Error Configuration Selects the action to take when P190 [DI Prchrg Seal] is used to indicate that an external precharge circuit has opened.	Default: 3 = "FltCoastStop" Options: 3 = "FltCoastStop" 4 = "Flt RampStop" 5 = "Flt CL Stop"	RW	32-bit Integer

DRIVE CFG	Braking Features	370 371	Stop Mode A Stop Mode B Stop Mode A, B Method of stopping the drive when a stop command is given. Normal Stop command and the RUN input changing from true to false will command a Normal Stop. "Coast" (0) – Power removed from motor, motor coasts to zero. "Ramp" (1) – Decelerates to zero speed at the decel rate. "Ramp to Hold" (2) – Decelerates to zero speed at the decel rate, followed by DC braking until the next start sequence. "DC Brake" (3) – DC braking is immediately applied (does not follow programmed decel ramp). "DCBrkAutoOff" (4) – Applies DC braking until zero speed is reached or DC brake time is reached, whichever is shorter. "Current Lmt" (5) – Max torque / current applied until zero speed "Fast Brake" (6) – High slip braking for maximum braking performance above base speed.	Default: 1 = "Ramp" 0 = "Coast" Options: 0 = "Coast" 1 = "Ramp" 2 = "Ramp to Hold" 3 = "DC Brake" 4 = "DCBrkAutoOff" 5 = "Current Lmt" 6 = "Fast Brake"	RW	32-bit Integer
		372 373	Bus Reg Mode A Bus Reg Mode B Bus Regulation Mode A, B Method and sequence of the DC bus regulator voltage. Choices are dynamic brake, frequency adjust or both. Sequence is determined by programming or digital input to the terminal block. <u>Dynamic Brake Setup</u> If a dynamic brake resistor is connected to the drive, both of these parameters must be set to either option 2, 3 or 4.	Default: 1 = "Adjust Freq" 4 = "Both-Frq 1st" Options: 0 = "Disabled" 1 = "Adjust Freq" 2 = "Dyn Brake" 3 = "Both-DB 1st" 4 = "Both-Frq 1st"	RW	32-bit Integer
		374	Bus Reg Lvl Cfg Bus Regulation Level Configuration Selects the reference used to determine the bus voltage regulation level for the bus voltage regulator and the reference used for the dynamic brake. "Bus Memory" (0) – References are determined based on P12 [DC Bus Memory]. "BusReg Level" (1) – References are determined based on the voltage set in the bus regulator level parameter P375 [Bus Reg Level]. If coordinated operation of the dynamic brakes of a common bus system is desired, use this selection and set the P375 [Bus Reg Level] to coordinate the brake operation of the common bus drives.	Default: 0 = "Bus Memory" Options: 0 = "Bus Memory" 1 = "BusReg Level"	RW	32-bit Integer

ATTENTION: The drive does not offer protection for externally-mounted brake resistors. A risk of fire exists if external braking resistors are not protected. External resistor packages must be self-protected from over-temperature or the protective circuit shown in [Figure C.1 on page C-2](#) (or equivalent) must be supplied.

File	Group	No.	Name Description	Values	Read-Write	Data Type		
DRIVE CFG	Braking Features	375	Bus Reg Level Bus Regulation Level Sets the “turn-on” bus voltage level for the bus voltage regulator and the dynamic brake.	Units: VDC Default: P20 < 252V DC: 375 P20 = 252...503V DC: 750 P20 = 504...629V DC: 937 P20 > 629V DC: 1076 Min/Max: P20 < 252V DC: 375/389 P20 = 252...503V DC: 750/779 P20 = 504...629V DC: 937/974 P20 > 629V DC: 1076/1118	RW	Real		
		376	Bus Limit Kp Bus Limit Proportional Gain Not functional when any of the FV motor control modes are selected.	Units: A/V Default: 1170.0 Min/Max: 0.0 / 1000000.0	RW	Real		
		377	Bus Limit Kd Bus Limit Derivative Gain Not functional when any of the FV motor control modes are selected.	Units: Secs Default: 152.0 Min/Max: 0.0 / 1000000.0	RW	Real		
		378	Bus Limit ACR Ki Bus Limit Active Current Regulator Integral Gain Not functional when any of the FV motor control modes are selected.	Default: 2045.0 Min/Max: 0.0 / 50000.0	RW	Real		
		379	Bus Limit ACR Kp Bus Limit Active Current Regulator Proportional Gain Not functional when any of the FV motor control modes are selected.	Units: Hz/A Default: 524.0 Min/Max: 0.0 / 100000.0	RW	Real		
		380	Bus Reg Ki Bus Regulator Integral Gain Integral gain for the bus voltage regulator. Sets the responsiveness of the bus voltage regulator.	Default: 100.000 Min/Max: 0.000 / 65535.000	RW	Real		
		381	Bus Reg Kp Bus Regulator Proportional Gain Proportional gain for the bus voltage regulator. Sets the responsiveness of the bus voltage regulator.	Default: 10.000 Min/Max: 0.000 / 65535.000	RW	Real		
		382	DB Resistor Type Dynamic Brake Resistor Type Selects whether the internal or external DB protection will be used. Important: Only one DB resistor can be connected to Frame 2 drives. If an external dynamic brake is used with a Frame 2 drive, the internal dynamic brake resistor must be disconnected. Connecting both an internal and external resistor is likely to cause drive damage. If a dynamic brake resistor is connected to the drive, P372 [Bus Reg Mode A] and P373 [Bus Reg Mode B] must be set to either option 2, 3, or 4; otherwise the dynamic brake will not turn on.	Default: 0 = “Internal” Options: 0 = “Internal” 1 = “External”	RW	32-bit Integer		
		<div style="border: 1px solid black; padding: 10px;">  <p>ATTENTION: Equipment damage may result if a drive mounted (internal) resistor is installed and this parameter is set to “External.” Thermal protection for the internal resistor will be disabled, resulting in possible device damage.</p> <p>ATTENTION: The drive does not offer protection for externally-mounted brake resistors. A risk of fire exists if external braking resistors are not protected. External resistor packages must be self-protected from over-temperature or the protective circuit shown in Figure C.1 on page C-2 (or equivalent) must be supplied.</p> </div>						
		383	DB Ext Ohms Dynamic Brake External Ohms Calculates the maximum negative torque available from the dynamic brake and is used for the external resistor dynamic brake protection.	Units: Ohms Default: Based on Drive Rating Min/Max: Internal / 10000	RW	Real		
384	DB Ext Watts Dynamic Brake External Watts Sets the continuous rated power reference for the external dynamic brake resistor. Only valid when an external dynamic brake resistor is selected (P382 [DB Resistor Type] = 1 “External”). The DB continuous watts are used in the dynamic brake thermal protection algorithm. Important: If customer-supplied protection is to be used in place of the drive’s calculated resistor thermal protection, set the [DB Ext Watts] to its maximum value.	Units: Watt Default: 100.00 Min/Max: 1.00 / 500000.00	RW	Real				

File	Group	No.	Name Description	Values	Read-Write	Data Type		
DRIVE CFG	Braking Features	385	DB ExtPulseWatts Dynamic Brake External Pulse Watts Sets the thermal transient response of the external dynamic brake resistor defined by the maximum allowable power to the dynamic brake resistor for 1 second without exceeding the resistor's element temperature. This parameter is only valid when an external dynamic brake resistor is selected (P382 [DB Resistor Type] = 1 "External"). If this value is not available from the resistor vendor it can be approximated by 1 or 2 below: 1. [DB ExtPulseWatts] = 75,000 x weight (lbs), where weight is the weight of the resistor wire in pounds (not the weight of the entire resistor). 2. [DB ExtPulseWatts] = Time Constant x Brake Watts, where the Time Constant equals the amount of time to reach 63% of its rated temperature while the maximum power is applied to the resistor and Brake Watts is the maximum continuous power rating of the resistor. Important: If customer supplied protection is to be used in place of the drive's calculated resistor thermal protection, set the [DB ExtPulse Watts] to its maximum value.	Units: Watt Default: 2000.00 Min/Max: 1.00 / 100000000.00	RW	Real		
		388	Flux Braking En Flux Braking Enable Displays a value of 1 when flux braking is active and 0 when flux braking is not active.	Default: 0 = "Disabled" Options: 0 = "Disabled" 1 = "Enabled"	RW	32-bit Integer		
		389	Flux Braking Lmt Flux Braking Limit Sets the limit on the desired motor voltage during flux braking as a percent of P25 [Motor NP Volts].	Units: % Default: 125.00 Min/Max: 100.00 / 250.00	RW	Real		
		390	Flux Braking Ki Flux Braking Integral Gain Flux braking controller integral gain.	Default: 10000.0 Min/Max: 0.0 / 1000000.0	RW	Real		
		391	Flux Braking Kp Flux Braking Proportional Gain Flux braking controller proportional gain.	Default: 100.0 Min/Max: 0.0 / 1000000.0	RW	Real		
		393	DC Brake Lvl Sel  DC Brake Level Select Sets link to source used for P394 [DC Brake Level].	Default: 394 Min/Max: 1 / 159999	RW	32-bit Integer		
		394	DC Brake Level DC Brake Level Defines the DC brake current level injected into the motor when [Stop Mode x] = 3 "DC Brake." This also sets the braking current level when 6 "Fast Stop" is selected. The DC braking voltage used in this function is created by a PWM algorithm and may not generate the smooth holding force needed for some applications.	Units: Amps Default: [Rated Amps] Min/Max: P21 [Rated Amps] x 0.01 / Based on Drive Rating	RW	Real		
		<hr/> <div style="display: flex; align-items: center;">  <p>ATTENTION: If a hazard of injury due to movement of equipment or material exists, an auxiliary mechanical braking device must be used.</p> </div> <div style="display: flex; align-items: center;">  <p>ATTENTION: This feature should not be used with synchronous or permanent magnet motors. Motors may be demagnetized during braking.</p> </div> <hr/>						
		395	DC Brake Time DC Brake Time Sets the amount of time DC brake current is "injected" into the motor. When the active stop mode, P370/371 [Stop Mode X] = 2 "Ramp to Hold," this parameter is ignored and DC braking is applied continuously.	Units: Secs Default: 0.00 Min/Max: 0.00 / 90.00	RW	Real		
		396	DC Brake Ki DC Brake Integral Gain Sets the integral term used in the current regulator which controls the DC Brake function.	Default: 10.0 Min/Max: 0.0 / 1000.0	RW	Real		

File	Group	No.	Name Description	Values	Read-Write	Data Type
DRIVE CFG	Braking Features	397	DC Brake Kp DC Brake Proportional Gain Sets the proportional term used in the current regulator which controls the DC Brake function.	Default: 1000.0 Min/Max: 0.0 / 10000.0	RW	Real
		398	DC Brk Vq Fitr DC Brake Vq Filter Sets the level of filtering used on the Vq signal when the active stop mode P370/371 [Stop Mode X] = 4 "DCBrkAutoOff."	Default: 250.0 Min/Max: 50.0 / 2000.0	RW	Real
		399	DC Brk Vd Fitr DC Brake Vd Filter Sets the level of filtering used on the Vd signal when the active stop mode P370/371 [Stop Mode X] = 4 "DCBrkAutoOff."	Default: 250.0 Min/Max: 50.0 / 2000.0	RW	Real
		400	Fast Braking Ki Fast Braking Integral Gain Sets the integral term used in the speed regulator which controls the Fast Braking function.	Default: 0.10 Min/Max: 0.00 / 10.00	RW	Real
		401	Fast Braking Kp Fast Braking Proportional Gain Sets the proportional term used in the speed regulator which controls the Fast Braking function.	Default: 0.0015 Min/Max: 0.0000 / 10.0000	RW	Real
		402	Brake Off Adj 1 Brake Off Adjustment 1 When Fast Braking is the selected Stop Mode, this parameter sets the power sensitivity to transition from Fast Braking to DC Brake. When DC Brake w/Auto ShutOff is selected, this parameter sets the level sensitivity for shut off.	Default: 1.00 Min/Max: 0.01 / 5.00	RW	Real
		403	Brake Off Adj 2 Brake Off Adjustment 2 When Fast Braking is the selected Stop Mode, this parameter sets the frequency sensitivity to transition from Fast Braking to DC Brake. When DC Brake w/Auto ShutOff is selected, this parameter sets the time sensitivity for shut off.	Default: 1.00 Min/Max: 0.01 / 5.00	RW	Real
		409	Dec Inhibit Actn Deceleration Inhibit Action Configures the response to a Decel Inhibit condition, which occurs when the drive is not decelerating due to bus voltage regulation.	Default: 3 = "FltCoastStop" Options: 0 = "Ignore" 1 = "Alarm" 2 = "Flt Minor" 3 = "FltCoastStop"	RW	32-bit Integer

Drive Protection File

File	Group	No.	Name Description	Values	Read-Write	Data Type
PROTECTION	Motor Overload	410	Motor OL Actn Motor Overload Action Configures the response to a motor overload condition.	Default: 3 = "FltCoastStop" Options: 0 = "Ignore" 1 = "Alarm" 2 = "Flt Minor" 3 = "FltCoastStop" 4 = "Flt RampStop" 5 = "Flt CL Stop"	RW	32-bit Integer
		411	Mtr OL at Pwr Up Motor Overload At Power Up Selects the mode to use for initial value of the motor overload counter, upon drive power-up.	Default: 0 = "Assume Cold" Options: 0 = "Assume Cold" 1 = "UseLastValue" 2 = "RealTimeClk"	RW	32-bit Integer
		412	Mtr OL Alarm Lvl Motor Overload Alarm Level Sets the level of P418 [Mtr OL Counts] for which a motor overload alarm will occur. Useful to provide warning prior to the drive taking action that is selected by P410 [Motor OL Actn]. This alarm level is different than , and independent of, the "Alarm" action selected by P410 [Motor OL Actn].	Units: % Default: 0.00 Min/Max: 0.00 / 100.00	RW	Real
		413	Mtr OL Factor Motor Overload Factor Sets the minimum level of current (in percent or P26 [Motor NP Amps]) that causes the motor overload counter to increment. Current levels below this value will decrement the overload counter. For example, a service factor of 1.15 implies continuous operation up to 115% of nameplate motor current.	Default: 1.00 Min/Max: 0.20 / 2.00	RW	Real
		414	Mtr OL Hertz Motor Overload Hertz Selects the output frequency below which the motor operating current is derated (more sensitive) to account for the reduced self-cooling capability of typical motors, operating at slower speeds. For motors with extra low speed cooling capacity (e.g. 10:1 or blower cooled), reduce this setting to take full advantage of the motor being used.	Units: Hz Default: 20.00 Min/Max: 0.00 / 4096	RW	Real
		415	Mtr OL Reset Lvl Motor Overload Reset Level Sets the level that resets a motor overload condition, and allows a fault (if selected as the motor overload action) to be manually reset.	Units: % Default: 0.00 Min/Max: 0.00 / 100.00	RW	Real
		416	MtrOL Reset Time Motor Overload Reset Time Displays the time it will take to restart the drive after a motor overload fault has occurred and the value in P418 [Mtr OL Counts] is less than the P415 [Mtr OL Reset Lvl].	Units: Secs Default: 0.00 Min/Max: -/+99999.00	RW	Real
		418	Mtr OL Counts Motor Overload Counts Accumulated percentage of motor overload. Continuously operating the motor over 100% of the motor overload setting will increase this value to 100% and cause the action selected in P410 [Motor OL Actn] to be taken.	Units: % Default: 0.00 Min/Max: 0.0 / 100.00	RO	Real
		419	Mtr OL Trip Time Motor Overload Trip time Displays the inverse of the motor overload time, equal to the number of seconds before P418 [Mtr OL Counts] reaches 100%, and the motor overload action is taken.	Units: Secs Default: 99999 Min/Max: 0 / 99999	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
PROTECTION	Load Limits	420	Drive OL Mode Drive Overload Mode  Selects the action to take when the drive detects that it is being overloaded. Reducing current limit and / or PWM frequency may allow the drive to continue running without faulting. When using a sine wave output filter, set this parameter to 1 "Reduce CLmt" or 0 "Disabled."	Default: 3 = "Both-PWM1rst" Options: 0 = "Disabled" 1 = "Reduce CLmt" 2 = "Reduce PWM" 3 = "Both-PWM1rst"	RW	32-bit Integer
		421	Current Lmt Sel Current Limit Select Selects the source for the current limit value. When the load is large enough to cause current that equals or exceeds this value, the output frequency will automatically adjust (increase or decrease, as required) to attempt limiting the output current to this value.	Default: 422 Options: 1 / 159999	RW	32-bit Integer
		422 423	Current Limit 1 Current Limit 2 Current Limit 1, 2 Constant values that can be used as sources for P421 [Current Lmt Sel].	Units: Amps Default: Based on Drive Rating Min/Max: Based on Drive Rating	RW	Real
		424	Active Cur Lmt Active Current Limit Displays the current that is actively being used, including the automatic foldback effect from the drive overload function (see P420 [Drive OL Mode]).	Units: Amps Default: 0.00 Min/Max: -/+P26 [Motor NP Amps] x 8	RO	Real
		425	Current Rate Lmt Current Rate Limit Sets the largest allowable rate of change for the torque producing current reference (Iq). This number is scaled in percent of rated motor current for every 250 microseconds.	Units: % Default: 400.00 Min/Max: 1.00 / 800.00	RW	Real
		426	Regen Power Lmt Regenerative Power Limit Sets the limit for power flow from the motor to the drive (regenerating).	Units: % Default: -50.00 Min/Max: -800.00 / 0.00	RW	Real
		427	Motor Power Lmt Motor Power Limit Sets the limit for power flow from the drive to the motor (motoring).	Units: % Default: 200.00 Min/Max: 0.00 / 800.00	RW	Real

When using an analog input for the speed reference, this parameter is scaled to P51/61 [Anlg In X Hi] on the I/O module.	Units: Hz RPM Default: P27 [Motor NP Hertz] x -1.00 P28 [Motor NP RPM] x -1.00 Min/Max: [Motor NP Hertz] x -16.00 / 0.00 [Motor NP RPM] x -16.00 / 0.00	RW	Real
		522	Min Fwd Speed Minimum Forward Speed  Sets the low limit for speed reference after scaling is applied. Refer to P524 [Overspeed Limit]. When using an analog input for the speed reference, this parameter is scaled to P52/62 [Anlg InX Lo] on the I/O module.	Units: Hz RPM Default: 0.00 Min/Max: 0.00 / [Motor NP Hertz] x 16.00 0.00 / [Motor NP RPM] x 16.00	RW	Real
		523	Min Rev Speed Minimum Reverse Speed  Sets the low limit for speed reference after scaling is applied. Refer to P524 [Overspeed Limit]. When using an analog input for the speed reference, this parameter is scaled to P52/62 [Anlg InX Lo] on the I/O module.	Units: Hz RPM Default: 0.00 Min/Max: [Motor NP Hertz] x -16.00 / 0.00 [Motor NP RPM] x -16.00 / 0.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Limits	524	Overspeed Limit Overspeed Limit  Sets the incremental amount of the output frequency (above maximum speed: either P520 [Max Fwd Speed] or P521 [Max Rev Speed]) allowable for functions such as slip compensation. Maximum speed + P524 [Overspeed Limit] must be ≤ P37 [Maximum Freq]	Units: Hz RPM Default: P27 [Motor NP Hertz] / 6 P28 [Motor NP RPM] / 6 Min/Max: 0.00 / (P27 [Motor NP Hertz] / 3) 0.00 / (P28 [Motor NP RPM] / 6)	RW	Real
		525	Zero Speed Limit Zero Speed Limit  Establishes a band around zero speed that is used to determine when the drive considers the motor to be at zero speed.	Units: Hz RPM Default: P27 [Motor NP Hertz] x 0.001 P28 [Motor NP RPM] x 0.001 Min/Max: 0.00 / P27 [Motor NP Hertz] x 0.5 0.00 / P28 [Motor NP RPM] x 0.5	RW	Real
		526 527 528	Skip Speed 1 Skip Speed 2 Skip Speed 3 Skip Speed 1, 2, 3 Sets a frequency at which the drive will not operate. [Skip Speed X] and P529 [Skip Speed Band] must not equal 0.	Units: Hz Default: 0.00 Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real
		529	Skip Speed Band Skip Speed Band Sets the bandwidth around a skip speed. [Skip Speed Band] is split, applying 1/2 above and 1/2 below the skip speed. The same bandwidth applies to all skip speeds.	Units: Hz RPM Default: 0.00 Min/Max: 0.00 / P27 [Motor NP Hertz] x 0.5 0.00 / P28 [Motor NP RPM] x 0.5	RW	Real
						
SPEED CONTROL	Speed Ramp Rates	535 536	Accel Time 1 Accel Time 2 Acceleration Time 1, 2 Sets the acceleration rate for all speed changes. Defined as the time to accelerate from 0 to P27 [Motor NP Hertz] or P28 [Motor NP RPM], according to the setting in P300 [Speed Units]. Selection between Acceleration Time 1 and Acceleration Time 2 is controlled by a digital input function (see Digin Functions) or by Logic Command (sent over a communication network).	Units: Secs Default: 10.00 Min/Max: 0.00 / 3600.00	RW	Real
		537 538	Decel Time 1 Decel Time 2 Deceleration Time 1, 2 Sets the deceleration rate for all speed changes. Defined as the time to decelerate from P27 [Motor NP Hertz] or P28 [Motor NP RPM] to 0, according to the setting in P300 [Speed Units]. Selection between Deceleration Time 1 and Deceleration Time 2 is controlled by a digital input function (see Digin Functions) or by Logic Command (sent over a communication network). Some stop modes (see P370 and P371) will cause the programmed decel time to be ignored during a stop command.	Units: Secs Default: 10.00 Min/Max: 0.00 / 3600.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Ramp Rates	539	Jog Acc Dec Time Jog Acceleration Deceleration Time Acceleration and deceleration rates while commanding jog (uses a jog speed reference).	Units: Secs Default: 10.00 Min/Max: 0.00 / 3600.00	RW	Real
		540	S Curve Accel S Curve Acceleration Sets the percentage of accel time applied to the ramp to soften (reduce jerk) the acceleration. Time is added, 1/2 at the beginning and 1/2 at the end of the ramp.	Units: % Default: 0.000 Min/Max: 0.000 / 100.000	RW	Real
		541	S Curve Decel S Curve Deceleration Sets the percentage of decel time applied to the ramp to soften (reduce jerk) the deceleration. Time is added, 1/2 at the beginning and 1/2 at the end of the ramp.	Units: % Default: 0.000 Min/Max: 0.000 / 100.000	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Reference	545 550	Spd Ref A Sel Spd Ref B Sel Speed Reference A Select Speed Reference B Select <input checked="" type="checkbox"/> Selects the source for speed references while in "Auto" (typical) mode. When the drive is in "Manual" mode, these sources are overridden (see P327). [Spd Ref A Sel] is the drive's main speed reference. [Spd Ref B Sel] is an alternate speed reference. Selecting between Reference A and Reference B is controlled by a digital input function (see Digin Functions) or by Logic Command (sent over a communication network).	Default: 871 551 Min/Max: 0 / 159999	RW	32-bit Integer
		546 551	Spd Ref A Stpt Spd Ref B Stpt Speed Reference A Setpoint Speed Reference B Setpoint A constant speed value (similar to a preset speed) to be used as a possible source for P545 and P550.	Units: Hz RPM Default: 0.0000 Hz Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P27 [Motor NP RPM] x 8	RW	Real
		547 552	Spd Ref A AnlgHi Spd Ref B AnlgHi Speed Reference A Analog High Speed Reference B Analog High Used only when an analog input is selected as a speed reference according to P546 or P551. Sets the speed that corresponds to [Anlg InX Hi] on an I/O module. This establishes scaling throughout the range.	Units: Hz Default: P520 [Max Fwd Speed] Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real
		548 553	Spd Ref A AnlgLo Spd Ref B AnlgLo Speed Reference A Analog Low Speed Reference B Analog Low Used only when an analog input is selected as a speed reference according to P546 or P551. Sets the speed that corresponds to [Anlg InX Lo] on an I/O module. This establishes scaling throughout the range.	Units: Hz Default: 0.00 Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																		
SPEED CONTROL	Speed Reference	549 554	Spd Ref A Mult Spd Ref B Mult Speed Reference A Multiplier Speed Reference B Multiplier Applies multipliers to speed references A and B respectively.	Default: 1.00 Min/Max: -/+22000.00	RW	Real																																																		
		555	Spd Ref Scale Speed Reference Scale Applies only in Flux Vector (FV) modes according to P35 [Motor Ctrl Mode]. Applies a multiplier to P595 [Filtered Spd Ref] after it has been offset by the PID function (P1093 [PID Output Meter]). The scaled result, once limited, will become the primary component of the value of P597 [Final Speed Ref].	Default: 1.000 Min/Max: 0.000 / 1000.000	RW	Real																																																		
		556 557	Jog Speed 1 Jog Speed 2 Jog Speed 1, 2 The speed used for jogging when the Jog 1 or Jog 2 function (respectively) is activated by a digital input function or by Logic Command (sent over a communication network).	Units: Hz Default: P27 [Motor NP Hertz] / 6 P27 [Motor NP RPM] / 6 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P27 [Motor NP RPM] x 8	RW	Real																																																		
		558	MOP Reference Motor Operated Potentiometer Reference Value of the MOP (Motor Operated Potentiometer) Reference to be used as a possible source for P545 and P550. The MOP Reference is activated (incremented or decremented) by digital input functions.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real																																																		
		559	Save MOP Ref Save Motor Operated Potentiometer Reference Enables/disables the feature that saves the present MOP Ref value at power down or stop. Options <table border="1" style="margin-left: 20px;"> <tr> <td></td> <td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>At Stop</td><td>At Pwr Down</td> </tr> <tr> <td>Default</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>Bit</td> <td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td> </tr> </table> 0 = False 1 = True		Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	At Stop	At Pwr Down	Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

		560	MOP Rate Motor Operated Potentiometer Rate Sets the rate of change of the MOP reference when an increasing or decreasing MOP signal is present.	Units: %/Secs Default: 1.0000 Min/Max: 0.0100 / 100.0000	RW	Real																																																		
		561	MOP High Limit Motor Operated Potentiometer High Limit Sets the upper limit for the MOP Reference.	Units: % Default: 100.000 Min/Max: 0.000 / 800.000	RW	Real																																																		
562	MOP Low Limit Motor Operated Potentiometer low Limit Sets the lower limit for the MOP Reference.	Units: % Default: -100.000 Min/Max: -800.000 / 0.000	RW	Real																																																				
563	DI ManRef Sel  Digital Input Manual Reference Select Selects a speed reference to be used when a digital input activates Manual control, according to the operation described by P172 [DI Manual Ctrl].	Default: 872 Min/Max: 1 / 159999	RW	32-bit Integer																																																				
564	DI ManRef AnlGHi Digital Input Manual Reference Analog High Hi scale for the manual speed reference that is activated by a digital input when P563 [DI ManRef Sel] is connected to an Analog Input.	Units: Hz RPM Default: P520 [Max Fwd Speed] Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real																																																				

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Reference	565	DI ManRef AnlgLo Digital Input Manual Reference Analog Low Used only when P563 [DI ManRef Sel] has selected an analog input as the source of the speed reference. Specifies the speed reference value that will be associated with the Analog In Lo parameter for the I/O Module. Example, P563 [DI ManRef Sel] has selected P50 [Anlg In0 Value] on an I/O Module. The P51 [Anlg In0 Hi] parameter on the I/O Module is set to -10 volts. P564 [DI ManRef AnlgHi] will specify the speed reference value that will correspond with a -10 volt analog input signal.	Units: Hz RPM Default: 0.000 Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real
		571 572 573 574 575 576 577	Preset Speed 1 Preset Speed 2 Preset Speed 3 Preset Speed 4 Preset Speed 5 Preset Speed 6 Preset Speed 7 Preset Speed 1, 2, 3, 4, 5, 6, 7 Discrete speed references that are activated by a digital input function (see Digin Functions) or by Logic Command (sent over a communication network).	Units: Hz RPM Default: 1/12 x P27 or P28 (Preset Speed 1) 1/6 x P27 or P28 (Preset Speed 2) 1/3 x P27 or P28 (Preset Speed 3) 1/2 x P27 or P28 (Preset Speed 4) 2/3 x P27 or P28 (Preset Speed 5) 5/6 x P27 or P28 (Preset Speed 6) P27 or P28 (Preset Speed 7) Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real
		588	Spd Ref Filter Speed Reference Filter Selects the amount of filtering applied to the ramped speed reference (P594), and is only active in FV motor control modes (P35). When set to any of the custom settings (3, 4, or 5) the filter is configured using the values set in P589 [Spd Ref Fltr BW] and P590 [Spd Ref FltrGain]. Settings 4 and 5 initialize the values for light and heavy respectively.	Default: 0 = "Off" Options: 0 = "Off" 1 = "Light" 2 = "Heavy" 3 = "Custom" 4 = "SetCustLight" 5 = "SetCustHeavy"	RW	32-bit Integer
		589	Spd Ref Fltr BW Speed Reference Filter Bandwidth Sets the bandwidth of the speed reference filter when P588 [Spd Ref Filter] is set to one of the "Custom" settings (3, 4, or 5) A value of zero will disable (bypass) the filter.	Units: R/S Default: 0.00 Min/Max: 0.00 / 500.00	RW	Real
		590	Spd Ref FltrGain Speed Reference Filter Gain Sets the gain (kn) of the speed reference filter when P588 [Spd Ref Filter] is set to one of the "Custom" settings (3, 4, or 5). A gain value of zero results in a filter characteristic that behaves as a first order low pass. A gain value ranging between zero and one results in a lag type filter. A gain value greater than one results in a lead type filter. A gain value of one will disable (bypass) the filter. This is the default setting. This parameter has no units.	Default: 1.000 Min/Max: -/+5.000	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																						
SPEED CONTROL	Speed Reference	591	Spd Ref Sel Sts Speed Reference Select Status	<table border="1"> <tr> <td>Options</td> <td>Skip Band</td> <td>End Limt Sw</td> <td>Decel Limt Sw</td> <td>Unipolar Ref</td> <td>Rev Disable</td> <td>Bipolar Ref</td> <td>Sel Override</td> <td>Manual</td> <td>Preset Auto</td> <td>Trim Ref</td> <td>Trim Pct Ref</td> <td>MicroPsnMult</td> <td>Ref B Mult</td> <td>Ref A Mult</td> <td>Ref B Auto</td> <td>Ref A Auto</td> <td></td> </tr> <tr> <td>Default</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0 = False</td> </tr> <tr> <td>Bit</td> <td>15</td> <td>14</td> <td>13</td> <td>12</td> <td>11</td> <td>10</td> <td>9</td> <td>8</td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> <td>1 = True</td> </tr> </table> <p>Displays the operating status of the speed referencing section of the drive. Individual bits are provided to represent the following conditions:</p> <p>Bit 0 "Ref A Auto" – When set, the Reference A Auto path is active. Control Logic has selected the Speed Reference source A. The exact origin of this speed reference is determined by the parameter specified in P545 [Spd Ref A Sel]. This parameter should also be reported in P930 [Speed Ref Source].</p> <p>Bit 1 "Ref B Auto" – When set, the Reference B Auto path is active. Control Logic has selected the Speed Reference source B. The exact origin of this speed reference is determined by the value specified in P550 [Spd Ref B Sel]. This parameter should also be reported in P930 [Speed Ref Source].</p> <p>Bit 2 "Ref A Mult" – When set, speed reference A is being modified by P549 [Spd Ref A Mult]. When clear, either the multiplier is 1 or is not affecting the speed reference because the Ref A Auto path is inactive.</p> <p>Bit 3 "Ref B Mult" – When set, the speed reference B is being modified by P554 [Spd Ref B Mult]. When clear, either the multiplier is 1 or is not affecting the speed reference because the "Ref B Auto" path is inactive.</p> <p>Bit 4 "MicroPsnMult" – When set, P592 [Selected Spd Ref] is being multiplied by P1112 [MicroPsnScalePct].</p> <p>Bit 5 "Trim Pct Ref" – When set, the speed reference is being multiplied by one plus the value of the parameter indicated in P616 [SpdTrimPrcRefSrc].</p> <p>Bit 6 "Trim Ref" – When set, the speed reference is being offset by the value of the parameter indicated in P617 [Spd Trim Source].</p> <p>Bit 7 "Preset Auto" – When set, Control Logic has selected a preset auto speed reference. The P930 [Speed Ref Source] parameter will indicate the source of this reference.</p> <p>Bit 8 "Manual" –</p> <p>Bit 9 "Sel Override" – The Selected Speed Reference parameter has been overridden by another reference. Refer to P930 [Speed Ref Source] for the cause of the override.</p> <p>Bit 10 "Bipolar Ref" – When set, P308 [Direction Mode] = 1 "Bipolar." When in bipolar mode, the sign of the speed reference value will determine the direction of motor rotation.</p> <p>Bit 11 "Rev Disable" – When set, P308 [Direction Mode] = 2 "Rev Disable." When in reverse disable mode, negative speed reference values are rejected and a zero speed value is used in their place.</p> <p>Bit 12 "Unipolar Ref" – When set, P308 [Direction Mode] = 0 "Unipolar." When in unipolar mode, the sign of the speed reference value (and therefore direction of motor rotation) is determined by P679 [Drive Logic Rslt] Bit 4 "Forward" and Bit 5 "Reverse."</p> <p>Bit 13 "Decel Lmt Sw" – When set, the Torque Proving function's control logic has detected a decel limit switch active and has selected P571 [Preset Speed 1] for the speed reference value.</p> <p>Bit 14 "End Lim Sw" – When set, the Torque Proving function's control logic has detected an end limit switch active and has selected zero speed for the speed reference value.</p> <p>Bit 15 "Skip Band" – When set, the Skip Band function has modified P2 [Commanded SpdRef]. When clear, the Skip Band function has not changed P2 [Commanded SpdRef].</p>	Options	Skip Band	End Limt Sw	Decel Limt Sw	Unipolar Ref	Rev Disable	Bipolar Ref	Sel Override	Manual	Preset Auto	Trim Ref	Trim Pct Ref	MicroPsnMult	Ref B Mult	Ref A Mult	Ref B Auto	Ref A Auto		Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0 = False	Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	1 = True

592	Selected Spd Ref Selected Speed Reference Displays the value of the active speed reference.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RO	Real																																																								
593	Limited Spd Ref Limited Speed Reference Displays the value of the speed reference after the following limits have been applied: P520 [Max Fwd Speed], P521 [Max Rev Speed], P522 [Min Fwd Speed] and P523 [Min Rev Speed].	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RO	Real																																																								

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Reference	594	Ramped Spd Ref Ramped Speed Reference Displays the output of the speed reference ramp and S-curve functions, but prior to any corrections added by slip comp, PI, etc.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RO	Real
		595	Filtered Spd Ref Filtered Speed Reference Displays the output of the filter that is applied by P588.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RO	Real
		596	Speed Rate Ref Speed Rate Reference This parameter is shared by both the Inertia Compensation and Speed Compensation functions. These functions are only available in the Flux Vector selections for P35 [Motor Ctrl Mode]. A value shared by both the Inertia Compensation and Speed Compensation functions (active only in FV motor control modes), typically supplied by an external controller that is also providing a rate limited speed reference. The Speed Rate Reference corresponds to the derivative with respect to time of the speed reference signal. Units of time are in seconds. For example, if the controller provides a 10 second reference ramp, the controller would also supply a Speed Rate Ref value of 1 pu / 10 sec = 0.1 sec-1 while the reference is accelerating. When the reference is constant, Speed Rate Ref should be zero.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RW	Real
		597	Final Speed Ref Final Speed Reference Displays the speed reference value, after all reference modifications (including ramps), that is used as a final reference by the speed regulator. In Open Loop, Sensorless Vector mode, then this value represents the anticipated motor operating speed, and may differ slightly from the output frequency value due to slip compensation.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RO	Real

SPEED CONTROL	Speed Trim	600 604	Trim Ref A Sel Trim Ref B Sel  Trim Reference A Select Trim Reference B Select Selects a trim source (in Hz or RPM) for Speed Reference A or Speed Reference B, respectively. For trim in % instead of Hz or RPM, use P608 and P612 (TrimPct RefX Sel).	Default: P601 [Trim Ref A Sel] P605 [Trim Ref B Stpt] Min/Max: 0 / 159999	RW	32-bit Integer
		601 605	Trim Ref A Stpt Trim Ref B Stpt Trim Reference A Setpoint Trim Reference B Setpoint A digital value to be used as a possible trim source for P600 or P604, respectively	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] -/+P28 [Motor NP RPM]	RW	Real
		602 606	Trim RefA AnlgHi Trim RefB AnlgHi Trim Reference A Analog High Trim Reference B Analog High Used only when an analog input is selected as a trim source according to P600 or P604. Sets the amount of trim that corresponds to [Anlg InX Hi] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: Hz RPM Default: P520 [Max Fwd Speed] Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Trim	603 607	Trim RefA AnlgLo Trim RefB AnlgLo Trim Reference A Analog Low Trim Reference B Analog Low Used only when an analog input is selected as a trim source according to P600 or P604. Sets the amount of trim that corresponds to [Anlg InX Lo] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: Hz RPM Default: 0.00 Min/Max: P521 [Max Rev Speed] / P520 [Max Fwd Speed]	RW	Real
		608 612	TrmPct RefA Sel TrmPct RefB Sel  Trim Percent Reference A Select Trim Percent Reference B Select Selects a trim source (in %) for Speed Reference A or Speed Reference B, respectively. For trim in Hz or RPM instead of %, use P600 and P604 (Trim Ref X Sel).	Default: P609 [TrmPct RefA Stpt] P613 [TrmPct RefB Stpt] Min/Max: 0 / 159999	RW	32-bit Integer
		609 613	TrmPct RefA Stpt TrmPct RefB Stpt Trim Percent Reference A Setpoint Trim Percent Reference B Setpoint A digital value to be used a possible trim source for P608 or P612, respectively.	Units: % Default: 0.000 Min/Max: -/+800.000	RW	Real
		610 614	TrmPct RefA AnHi TrmPct RefB AnHi Trim Percent Reference A Analog High Trim Percent Reference B Analog High Used only when an analog input is selected as a percent trim source according to P608 or P612. Sets the amount of trim that corresponds to [Anlg InX Hi] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: % Default: 100.00 Min/Max: -/+800.00	RW	Real
		611 615	TrmPct RefA AnLo TrmPct RefB AnLo Trim Percent Reference A Analog Low Trim Percent Reference B Analog Low Used only when an analog input is selected as a percent trim source according to P608 or P612. Sets the amount of trim that corresponds to [Anlg InX Lo] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: % Default: 0.00 Min/Max: -/+800.00	RW	Real
		616	SpdTrimPrcRefSrc Speed Trim Percent Reference Source Displays the source of Motor Speed Reference Trim Percent, in the format SSPPPP, where SS indicates the source port number (if non-zero) and PPPP indicates the source parameter number. A value of zero indicates that a source has not been assigned.	Default: 0 Min/Max: 0 / 159999	RO	32-bit Integer
		617	Spd Trim Source Speed Trim Source Displays the source of Motor Speed Reference Trim, in the format SSPPPP, where SS indicates the source port number (if non-zero) and PPPP indicates the source parameter number. A value of zero indicates that a source has not been assigned.	Default: 0 Min/Max: 0 / 159999	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Slip/Droop Comp	620	Droop RPM at FLA Droop Revolutions Per Minute at Full Load Amps Selects amount of droop that the speed reference is reduced when at full load torque. Zero disables the droop function.	Units: RPM Default: 0.00 Min/Max: 0.00/900.00	RW	Real
		621	Slip RPM at FLA Slip Revolutions Per Minute at Full Load Amps For open loop modes, this parameter sets the amount of slip (in rpm) that the motor is expected to experience at full load. A setting of zero disables slip compensation (not used in closed loop modes with encoder feedback). If the value of P70 [Autotune] is set to "Calculate", this value (in addition to others) is automatically calculated, and cannot be manually adjusted.	Units: RPM Default: (P27 [Motor NP Hz] x 120) / (P31 [Motor Poles] – P28 [Motor NP RPM]) Min/Max: 0.00 / 1200.00	RW	Real
		622	Slip Comp BW Slip Compensation Bandwidth Adjusts the bandwidth of a low pass filter used for slip compensation. The response time of slip compensation will vary inversely with the setting of this filter.	Units: R/S Default: 10.00 Min/Max: 1.00 / 50.00	RW	Real
		623	VHzSV SpdTrimReg Volts per Hertz Sensorless Vector Speed Trim Regulator Displays the amount of trim that the slip compensation function dynamically adds (based on load) to final speed reference for improved open loop speed control.	Units: Hz RPM Default: 0.00 Min/Max: –/+P27 [Motor NP Hertz] x 8 –/+P28 [Motor NP RPM] x 8	RO	Real

Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0																																								
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																								
			Configures options related to Speed Control as follows:																																																					
			Bit 0 "Ramp Hold" – The output of the speed reference ramp will stop changing and hold its output constant while this bit is set. When this bit is clear, the ramp output will be allowed to change. If this bit becomes set while P594 [Ramped Spd Ref] is in the S Curve region, the S Curve will be allowed to complete before the output is held.																																																					
			Bit 1 "Ramp Disable" – When set, the speed reference ramp will become disabled. P594 [Ramped Spd Ref] will track the ramp input.																																																					
			Bit 2 "StpNoSCrvAcc" – There are some conditions where the drive may continue to accelerate briefly following a request to stop. This will occur if the drive was in the process of accelerating on an S Curve when the stop request occurred. This bit enables an option to discontinue acceleration immediately when the stop request occurs. The S Curve profile that was in process will then change to a linear decel ramp.																																																					
			Bit 3 "SpdRegIntRes" – When set, the P654 [Spd Reg Int Out] which is the output of the Vector mode speed regulator's integral term will be forced to zero. The same result can be achieved by setting the regulator's integral gain to zero.																																																					
			Bit 4 "SpdRegIntHld" – When set, the P654 [Spd Reg Int Out] which is the output of the Vector mode speed regulator's integral term will stop changing and be held constant. Other conditions in the drive such as a limit condition in P945 [At Limit Status] may have the same result.																																																					
			Bit 5 "SpdErrFilter" – When set, the speed error filter in the drive's Vector mode speed regulator will be configured for a single stage low pass filter. When clear, the error filter will be configured for a two stage low pass filter. The two stage configuration is the normal or default setting for the error filter.																																																					
			Bit 6 "Jog No Integ" – When set, the P654 [Spd Reg Int Out] which is the output of the Vector mode speed regulator's integral term will be forced to zero while jogging.																																																					
			Bit 7 "Auto Tach SW" – This bit is used to enable the Automatic Tach Switchover feature. This feature is used to switch motor velocity feedback sources from the Primary to Alternate source in the event that the primary source fails. This switchover can take place while the drive is running. The P936 [Drive Status 2] Bit 5 "FdbkLoss SwO" will indicate clear when the Primary source is active and set when the alternate source is active. Clearing the (Auto Tach SW) bit when the alternate source is active will restore control to the Primary source, provided that the primary source is functioning. If the (Auto Tach SW) bit remains off, then the Automatic Tach Switchover feature will be disabled.																																																					
			Bit 8 "Delayed Ref" – When this bit is set, an additional processor scan delay period is inserted between the P594 [Ramped Spd Ref] and the input to the Speed Reference filter. This delay is intended to be used in applications where multiple, coordinated drives are used. A drive that supplies the speed reference for use by other drives to follow would typically use this delay. The delay would allow time for the speed reference to reach the other units before it is acted upon by the sourcing unit, thereby synchronizing the speed reference among all units. When this bit is clear, no speed reference delay is inserted.																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Regulator	636	Speed Reg BW Speed Regulator Bandwidth Sets the speed loop bandwidth and determines the dynamic behavior of the speed loop. As bandwidth increases, the speed loop becomes more responsive and can track a faster changing speed reference. A change to this parameter will cause an automatic update of P645 [Speed Reg Kp], P647 [Speed Reg Ki] and P644 [Spd Err Filt BW]. The configuration settings for Inertia Adaption (product dependent) will also be automatically selected when this feature is enabled. To disable the automatic gain and filter update, set this parameter to a value of zero. The maximum allowable value of this parameter will be limited by the ratio of P646 [Spd Reg Max Kp] to P76 [Total Inertia], and the type of speed feedback source in use (encoder vs. open loop). For operation following an automatic tach switchover, the bandwidth specified in P648 [Alt Speed Reg BW] will be used.	Units: R/S Default: Calculated Min/Max: 0.00 / Calculated	RW	Real
		637	SReg FB Fitr Sel Speed Regulator Feedback Filter Select Selects the amount of filtering applied to the feedback channel of the speed regulator, and is only active in FV motor control modes (P35). When set to any of the custom settings (3, 4, or 5) the filter is configured using the values set in P638 [Spd Ref Fitr BW] and P639 [Spd Ref FitrGain]. Settings 4 and 5 initialize the values for light and heavy respectively.	Default: 0 = "Off" Options: 0 = "Off" 1 = "Light" 2 = "Heavy" 3 = "Custom" 4 = "SetCustLight" 5 = "SetCustHeavy"	RW	32-bit Integer
		638	SReg FB FitrGain Speed Regulator Feedback Filter Gain Sets the gain of the speed regulator feedback filter when P637 [SReg FB Fitr Sel] is set to one of the "Custom" settings (3, 4, or 5). A gain value of zero results in a filter characteristic that behaves as a first order low pass. A gain value ranging between zero and one results in a lag type filter. A gain value greater than one results in a lead type filter. A gain value of one will disable (bypass) the filter.	Default: 0.700 Min/Max: -5.000 / 20.000	RW	Real
		639	SReg FB Fitr BW Speed Regulator Feedback Filter Bandwidth Sets the bandwidth of the speed regulator feedback filter when P637 [SReg FB Fitr Sel] is set to one of the "Custom" settings (3, 4, or 5). A value of zero will disable (bypass) the filter.	Units: R/S Default: 35.00 Min/Max: 0.00 / 3760.00	RW	Real
		640	Filtered SpdFdbk Filtered Speed Feedback Displays the output of the filter that is applied by P637.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		641	Speed Error Speed Error Displays the error (difference) between the P597 [Final Speed Ref] (+) and the P640 [Filtered SpdFdbk] (-). This error signal is the primary input for the Vector control mode speed regulator.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type	
SPEED CONTROL	Speed Regulator	642	755 Servo Lock Gain Servo Lock Gain Sets the gain of an additional integrator in the Vector control mode speed regulator. The effect of Servo Lock is to increase stiffness of the speed response to a load disturbance. It behaves like a position regulator with velocity feed forward, but without the pulse accuracy of a true position regulator. Gain should normally be set to less than 1/3 speed regulator bandwidth, or for the desired response. A value of zero disables this feature.	Units: /Sec Default: 0.000 Min/Max: 0.000 / 300.000	RW	Real	
		643	SpdReg AntiBckup Speed Regulator Anti-backup Allows control of over-shoot/under-shoot in the step response of the Vector control mode speed regulator. Over-shoot/under-shoot can be effectively eliminated with a setting of 0.3, which will remove backup of the motor shaft when zero speed is reached. This parameter has no affect on the drive's response to load changes. A value of zero disables this feature.	Default: 0.0000 Min/Max: 0.0000 / 0.5000	RW	Real	
							
		644	Spd Err Fltr BW Speed Error Filter Bandwidth Sets the bandwidth of a 2nd order Butterworth low pass filter that is located in the proportional gain section of the speed regulator (in FV motor control modes). It filters a signal that is derived from P641 [Speed Error]. The purpose of this filter is to reduce quantization noise. When P636 [Speed Reg BW] is set to a non-zero value, this filter will be automatically set. If P636 [Speed Reg BW] is set to zero, this filter setting must be manually adjusted. It is normally set to at least 3 to 5 times the value of P636 [Speed Reg BW]. A value of zero disables the filter. The rules that are used to set the error filter bandwidth in automatic mode are as follows: 1. If the primary motor velocity feedback is Open Loop, then the error filter is set to 5 times P636 [Speed Reg BW]. 2. If a primary motor velocity feedback device has been selected and P704 [InAdp LdObs Mode] = 1 "InertiaAdapt," then the error filter is set to 3 times P636 [Speed Reg BW]. 3. If a primary motor velocity feedback device has been selected and P704 [InAdp LdObs Mode] = 0 "Disabled" or 2 "LoadObserver" then the error filter is using a table look up value determined by the setting of P126 [Pri Vel FdbkFltr]. Important: When Auto Tach Switchover is enabled through P635 [Spd Options Cntl], this filter adjustment applies only to the primary feedback source. The filter setting P651 [AltSpdErr FltrBW] is used for the alternate feedback source.	Units: R/S Default: 50.00 Min/Max: 0.00 / 8000.00	RW	Real	
		645	Speed Reg Kp Speed Regulator Kp Sets the proportional gain of the speed regulator (in FV motor control modes). This value is automatically calculated based on the bandwidth setting in P636 [Speed Reg BW] and P76 [Total Inertia]. The proportional gain may be manually adjusted by setting P636 [Speed Reg BW] to a value of zero. Proportional gain has effective scaling of (per unit torque) / (per unit speed). The maximum allowable value of this parameter is limited by P76 [Total Inertia] and P646 [Spd Reg Max Kp].	Default: 20.00 Min/Max: 0.00 / P646 [Speed Reg Max Kp]	RW	Real	
646	Speed Reg Max Kp Speed Regulator Maximum Kp Limits the maximum value of P645 [Speed Reg Kp] and P649 [Alt Speed Reg Kp]. When gains are automatically calculated, this parameter is necessary to limit the amplification of noise with increased inertia.	Default: 3000.00 Min/Max: 0.00 / 3000.00	RW	Real			

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Regulator	647	Speed Reg Ki Speed Regulator Ki Sets the integral gain of the speed regulator (in FV motor control modes). This value is automatically calculated based on the bandwidth setting in P636 [Speed Reg BW], P645 [Speed Reg Kp] and P653 [Spd Loop Damping]. Integral gain may be manually adjusted by setting P636 [Speed Reg BW] to a value of zero. Integral gain has effective scaling of (per unit torque/sec) / (per unit speed).	Units: /Sec Default: 50.00 Min/Max: 0.00 / 100000.00	RW	Real
		648	Alt Speed Reg BW Alternate Speed Regulator Bandwidth Provides an independent setting for the same function as P636 [Speed Reg BW], but is active only when Automatic Feedback Loss Switchover occurs (indicated by bit 5 of P936 [Drive Status 2]). A change to this parameter will cause an automatic update of P649 [Alt Speed Reg Kp], P650 [Alt Speed Reg Ki] and P651 [Alt Spd Err Filt BW]. See P636 for additional information regarding speed regulator bandwidth. Also see P635 [Spd Options Ctrl] to enable the Auto Tach Switchover feature.	Units: R/S Default: 10.00 Min/Max: 0.00 / Calculated	RW	Real
		649	Alt Speed Reg Kp Alternate Speed Regulator Kp Provides an independent setting for the same function as P645 [Speed Reg Kp], but is active only when Automatic Feedback Loss Switchover occurs (indicated by bit 5 of P936 [Drive Status 2]). This value is automatically calculated based on the bandwidth setting in P648 [Alt Speed Reg BW] and P76 [Total Inertia]. The proportional gain may be manually adjusted by setting P648 [Alt Speed Reg BW] to a value of zero.	Default: 20.00 Min/Max: 0.00 / Calculated	RW	Real
		650	Alt Speed Reg Ki Alternate Speed Regulator Ki Provides an independent setting for the same function as P647 [Speed Reg Ki], but is active only when Automatic Feedback Loss Switchover occurs (indicated by bit 5 of P936 [Drive Status 2]). This value is automatically calculated based on the bandwidth setting in P648 [Alt Speed Reg BW], P649 [Alt Speed Reg Kp] and P653 [Spd Loop Damping]. Integral gain may be manually adjusted by setting P648 [Alt Speed Reg BW] to a value of zero.	Default: 50.00 Min/Max: 0.00 / 100000.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Regulator	651	AltSpdErr FiltrBW Alternate Speed Error Filter Bandwidth Provides an independent setting for the same function as P644 [Spd Err Filt BW], but is active only when Automatic Feedback Loss Switchover occurs (indicated by bit 5 of P936 [Drive Status 2]) When P648 [Alt Speed Reg BW] is set to a non-zero value, this filter setting will be automatically selected. If P648 [Alt Speed Reg BW] is set to zero, then this filter setting must be manually adjusted. An error filter value of 0 will disable the filter. This filter is normally set to at least 3 to 5 times the value of P648 [Alt Speed Reg BW]. Units for the error filter are rad/sec (R/S). The rules that are used to set the error filter bandwidth in automatic mode are as follows: 1. If the alternate motor velocity feedback is Open Loop, then the error filter is set to 5 times P648 [Alt Speed Reg BW]. 2. If an alternate motor velocity feedback device has been selected and P704 [InAdp LdObs Mode] = 1 "InertiaAdapt," then the error filter is set to 3 times P648 [Alt Speed Reg BW]. 3. If an alternate motor velocity feedback device has been selected and P704 [InAdp LdObs Mode] 0 "Disabled" or 2 "LoadObserver" then the error filter is using a table look up value determined by the setting of P129 [Alt Vel FdbkFiltr].	Units: R/S Default: 50.00 Min/Max: 0.00 / 8000.00	RW	Real
		652	SReg Trq Preset Speed Regulator Torque Preset Sets the initial value of P654 [Spd Reg Int Out]. This is the output of the vector speed regulator's integral channel, and will be present in P654 [Spd Reg Int Out] when the regulator is first enabled (for example, upon rise of start or jog). The normal, default setting for this parameter is zero. In some applications, it may be necessary to preset the speed regulator integrator to a non-zero setting. This will result in the regulator's output reaching its final steady state value sooner than it would if the integrator started from zero.	Units: % Default: 0.00 Min/Max: -/+800.00	RW	Real
		653	Spd Loop Damping Speed Loop Damping Sets the damping factor of the vector speed loop's characteristic equation. Damping will affect the integral gain when a non-zero bandwidth has been entered. A damping factor of 1.0 is considered critical damping. Lowering the damping will produce faster load disturbance rejection, but may cause a more oscillatory response. When the speed regulator bandwidth is zero, gains are set manually and damping factor has no effect.	Default: 1.0000 Min/Max: 0.5000 / 65.0000	RW	Real
		654	Spd Reg Int Out Speed Regulator Integrator Output Displays the current value of the vector speed regulator's integral channel.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		655	Spd Reg Pos Lmt Speed Regulator Positive Limit Adjusts the upper limit of the vector speed regulator's output.	Units: % Default: 300.00 Min/Max: 0.00 / 600.00	RW	Real
		656	Spd Reg Neg Lmt Speed Regulator Negative Limit Adjusts the lower limit of the vector speed regulator's output.	Units: % Default: -300.00 Min/Max: -600.00 / 0.00	RW	Real

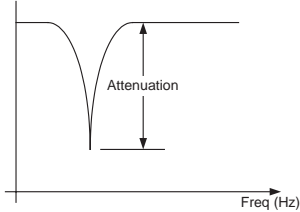

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Regulator	657	SReg OutFiltr Sel Speed Regulator Output Filter Select Selects the amount of filtering applied to the vector speed regulator's output. When set to any of the custom settings (3, 4, or 5) the filter is configured using the values set in P658 [SReg OutFiltrGain] and P659 [SReg Out FltrBW]. Settings 4 and 5 initialize the values for light and heavy respectively.	Default: 0 = "Disabled" Options: 0 = "Disabled" 1 = "Light" 2 = "Heavy" 3 = "Custom" 4 = "SetCustLight" 5 = "SetCustHeavy"	RW	32-bit Integer
		658	SReg OutFiltrGain Speed Regulator Output Filter Gain Sets the gain of the vector speed regulator's output filter when P657 [SReg Out Fltr Sel] is set to one of the "Custom" settings (3, 4, or 5). A gain value of zero results in a filter characteristic that behaves as a first order low pass. A gain value ranging between zero and one results in a lag type filter. A gain value greater than one results in a lead type filter. A gain value of one will disable (bypass) the filter.	Default: 1.000 Min/Max: +/-5.000	RW	Real
		659	SReg OutFiltr BW Speed Regulator Output Filter Bandwidth Sets the bandwidth of the speed regulator's output filter when P657 [SReg Out Fltr Sel] is set to one of the "Custom" settings (3, 4, or 5). A value of zero will disable (bypass) the filter.	Units: R/S Default: 35.00 Min/Max: 0.00 / 3760.00	RW	Real
		660	SReg Output Speed Regulator Output Displays the output of the vector speed regulator. This signal will be routed to the P685 [Selected TorqRef] when P313 [Actv SpTqPs Mode] has selected the output of the speed regulator.	Units: % Default: 0.00 Min/Max: +/- 800.00	RO	Real
		663	VHzSV Spd Reg Kp Volts per Hertz Sensorless Vector Speed Regulator Proportional Gain Adjusts the proportional gain of the Speed Regulator used in non-vector modes according to P35 [Motor Cntl Mode]. The output of this regulator will adjust P623 [VHzSV SpdTrimReg] when P131 [Active Vel Fdbk] originates from a feedback device.	Default: 20.00 Min/Max: 0.00 / 3000.00	RW	Real
		664	VHzSV Spd Reg Ki Volts per Hertz Sensorless Vector Speed Regulator Integral Gain Adjusts the integral gain of the Speed Regulator used in non-vector modes according to P35 [Motor Cntl Mode]. The output of this regulator will adjust P623 [VHzSV SpdTrimReg] when P131 [Active Vel Fdbk] originates from a feedback device.	Units: /Sec Default: 50.00 Min/Max: 0.00 / 100000.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
SPEED CONTROL	Speed Comp	665	<p>Speed Comp Sel Speed Compensation Select</p> <p>Configures the Speed Compensation function, which is used in Vector Control modes to create a feedforward compensation that is added into the speed reference. This helps compensate for position tracking errors during acceleration. These tracking errors are caused by the sample and hold process and delays caused by the position to velocity FIR filter. Speed Compensation will help reduce position error in position follower applications.</p> <p>Available settings for this parameter are:</p> <p>“Disabled” (0) – Function is disabled, speed compensation does not affect the speed reference.</p> <p>“Ramped Ref” (1) – Speed compensation function is enabled and uses an internally generated ramped speed reference signal. The rate of change (derivative) of the speed reference becomes the input to the Speed Compensation function. This is the most common setting when speed compensation is in use.</p> <p>“Rate Ref” (2) – Speed compensation function is enabled and uses an externally generated speed rate signal. The rate of change or derivative of the speed reference is supplied by P596 [Speed Rate Ref]. This signal is typically supplied by an external controller when the speed reference ramp is generated external to the drive.</p>	<p>Default: 0 = “Disabled”</p> <p>Options: 0 = “Disabled” 1 = “Ramped Ref” 2 = “Rate Ref”</p>	RW	32-bit Integer
		666	<p>Speed Comp Gain Speed Compensation Gain</p> <p>The Speed Compensation Gain adjusts the magnitude of P667 [Speed Comp Out]. This gain can be either manually set or automatically determined as part of automatic gain mode for Vector speed control. Automatic mode can be activated by selecting a motor speed feedback device in P125 [Pri Vel Fdbk Sel] and setting a non-zero speed regulator bandwidth in P636 [Speed Reg BW]. In automatic mode, the gain is calculated internally using a table lookup from the interrupt times and delays of the speed feedback FIR filter. For any other case – non-vector control, open loop speed feedback, or zero bandwidth setting, the speed compensation gain must be manually adjusted.</p>	<p>Default: -2.50</p> <p>Min/Max: -/+32767.00</p>	RW	Real
		667	<p>Speed Comp Out Speed Compensation Output</p> <p>Displays the output of the Speed Compensation function. This value will be summed with the speed reference, following the application of P555 [Spd Ref Scale].</p>	<p>Units: Hz RPM</p> <p>Default: 0.00</p> <p>Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8</p>	RO	Real

Drive Torque Control File

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Torque Limits	670	Pos Torque Limit Positive Torque Limit Defines the torque limit for the positive torque reference value. The reference will not be allowed to exceed this value.	Units: % Default: 200.00 Min/Max: 0.00 / 800.00	RW	Real
		671	Neg Torque Limit Negative Torque Limit Defines the torque limit for the negative torque reference value. The reference will not be allowed to exceed this value.	Units: % Default: -200.00 Min/Max: -800.00 / 0.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Torque Reference	675 680	Trq Ref A Sel Trq Ref B Sel  Torque Reference A Select Torque Reference B Select Selects the source for a torque reference, used when the drive is configured to command torque according to P309-312 [SpdTrqPsn Mode X]. The values of the torque reference sources are added together to provide a single torque reference.	Default: 676 681 Min/Max: 0 / 159999	RW	32-bit Integer
		676 681	Trq Ref A Stpt Trq Ref B Stpt Torque Reference A Setpoint Torque Reference B Setpoint A digital torque value to be used as a possible source for P675 and P680 respectively.	Units: % Default: 0.00 Min/Max: -/+800.00	RW	Real
		677 682	Trq Ref A AnlgHi Trq Ref B AnlgHi Torque Reference A Analog High Torque Reference B Analog High Used only when an analog input is selected as a torque reference according to P676 or P681. Sets the torque value that corresponds to [Anlg InX Hi] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: % Default: 100.00 Min/Max: -/+800.00	RW	Real
		678 683	Trq Ref A AnlgLo Trq Ref B AnlgLo Torque Reference A Analog Low Torque Reference B Analog Low Used only when an analog input is selected as a torque reference according to P676 or P681. Sets the torque value that corresponds to [Anlg InX Lo] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.	Units: % Default: 0.00 Min/Max: -/+800.00	RW	Real
		679 684	Trq Ref A Mult Trq Ref B Mult Torque Reference A Multiplier Torque Reference B Multiplier A multiplier that is applied to the values referenced by P675 and P680 respectively. A value of 1 leaves the reference unaffected. Negative values invert the reference.	Default: 1.000 Min/Max: -/+1000.000	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Torque Reference	685	Selected Trq Ref Selected Torque Reference Displays the torque value of the selected torque reference (dynamic selection according to P313 [Actv SpTqPs Mode]). This value will be summed with P686 [Torque Step]. The result is then applied to the input of the notch filter located in the Vector torque reference section.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		686	Torque Step Torque Step Defines the amount of torque reference step change to simulate a load disturbance, used to test the response. This value is added to the main torque reference P685 [Selected Torq Ref], and then applied to the input of the notch filter located in the Vector control torque reference section.	Units: % Default: 0.00 Min/Max: -/+800.00	RW	Real
		687	Notch Fltr Freq Notch Filter Frequency The center frequency for the Notch filter located in the Vector control torque reference section. To disable, set to zero (0).	Units: Hz Default: 0.00 Min/Max: 0.00 / 500.00	RW	Real
		688	Notch Fltr Atten Notch Filter Attenuation Sets the attenuation of the notch filter located in the Vector control torque reference section. Attenuation is the ratio of the notch filter input signal to its output at the P687 [Notch Fltr Freq]. An attenuation of 30 means that the notch output is 1/30th of the input at the specified frequency. 	Default: 50.000 Min/Max: 0.000 / 500.000	RW	Real
		689	Filtered Trq Ref Filtered Torque Reference Displays the output of the notch filter defined by P687 and P688. If P704 [InAdp LdObs Mode] indicates that either the Inertia Adaption or Load Estimate functions are active, then the filtered torque reference will also be modified by these functions.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		690	Limited Trq Ref Limited Torque Reference Displays the torque reference value after filtering (P689), power limits, torque limits, and current limits have been applied. Motor power limits are set by P426 [Regen Power Lmt] and P427 [Motor Power Lmt]. Motor torque limits are set by P670 [Pos Torque Limit] and P671 [Neg Torque Limit]. Motor current limit is set by P422 [Current Limit 1] or P423 [Current Limit 2].	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Inertia Comp	695	755 Inertia CompMode Inertia Compensation Mode The inertia compensation function calculates a feed forward torque signal P699 [Inertia Comp Out]. Inertia compensation attempts to predict the motor torque required to accelerate and decelerate an inertial load. The P699 [Inertia Comp Out] signal is summed with P660 [SReg Output] and becomes an input available to the P313 [Actv SpTqPs Mode] selector. The inputs to the inertia comp function are the rate of change of motor speed reference and P76 [Total Inertia]. This parameter enables the inertia comp function and selects possible sources of motor speed reference as follows: “Disabled” (0) – Inertia compensation function is disabled. P699 [Inertia Comp Out] is zero so the motor torque reference is not affected. “Int Ramp Ref” (1) – Inertia compensation is enabled. The function is configured to use the rate of change of P595 [Filtered Spd Ref]. This is the typical setting that should be used for inertia compensation on a stand-alone drive. “Ext Ramp Ref” (2) – Inertia compensation is enabled. The function is configured to use the rate of change of P700 [Ext Ramped Ref]. This setting is available for applications that supply a ramped speed reference external to the drive. “Spd Rate Ref” (3) – Inertia compensation is enabled. The function is configured to use the P596 [Speed Rate Ref]. This parameter should contain a value that represents the rate of change of the motor speed reference. This setting is available for applications that supply a ramped speed reference external to the drive.	Default: 0 = “Disabled” Options: 0 = “Disabled” 1 = “Int Ramp Ref” 2 = “Ext Ramp Ref” 3 = “Spd Rate Ref”	RW	32-bit Integer
		696	755 Inertia Acc Gain Inertia Acceleration Gain Sets the acceleration gain for the inertia compensation function. A value of 1 produces 100% compensation.	Default: 1.0000 Min/Max: 0.0000 / 2.0000	RW	Real
		697	755 Inertia Dec Gain Inertia Deceleration Gain Sets the deceleration gain for the inertia compensation function. A value of 1 produces 100% compensation.	Default: 1.0000 Min/Max: 0.0000 / 2.0000	RW	Real
		698	755 Inert Comp LPFBW Inertia Compensation Low Pass Filter Bandwidth Sets the bandwidth of a low pass filter for the inertia compensation function. The output of this filter supplies P699 [Inertia Comp Out].	Units: R/S Default: 35.00 Min/Max: 0.00 / 2000.00	RW	Real
		699	755 Inertia Comp Out Inertia Compensation Output Displays the output of the inertia compensation function. The P699 [Inertia Comp Out] signal is summed with P660 [Spd Reg Out] and becomes an input available to the P313 [Actv SpTqPs Mode] selector. Inertia compensation provides a torque feed forward signal during changes in motor speed reference.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		700	755 Ext Ramped Ref External Ramped Reference This parameter is meant for an external motor speed ramp input signal. This signal will be used by the inertia compensation function when P695 [InertiaComp Mode] = 2 “Ext Ramp Ref”. This parameter will be entered in units of Hz or RPM, depending on the value of P300 [Speed Units].	Units: Hz Default: RPM Min/Max: 0.00 -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Friction Comp	704	755 InAdp LdObs Mode Inertia Adaption Load Observer Mode Used to enable operation of either Inertia Adaption or Load Observer. These System Control modes are only available in Vector Control mode when using a motor speed feedback device. The value of P76 [Total Inertia] must be valid in order for these features to work correctly. The P70 [Autotune] setting 4 "Inertia Tune" can be used to measure the System Inertia. Regardless of the Sys Control mode used, the parameter P707 [Load Estimate] is updated for monitoring purposes. The possible settings for Sys Control Sel are: "Disabled" (0) – Both Inertia Adaption and Load Observer functions are disabled. P708 [InertiaTrqAdd] is zero so the motor torque reference is not affected. P707 [Load Estimate] is still valid, provided that the drive is in Vector Mode, using a motor speed feedback device, and a valid P76 [Total Inertia] is used. "InertiaAdapt" (1) – Inertia Adaption function is enabled. The Inertia Adaption function will provide enhanced stability, higher bandwidths and dynamic stiffness. Inertia Adaption is especially useful in systems with a gear-box that become, in effect, disconnected from the load. Inertia Adaption may also be used for motors with very little inertia that otherwise would lack dynamic stiffness, even at high bandwidths. The output of the Inertia Adaption function P708 [InertiaTrqAdd], will subtract from the motor torque reference. "LoadObserver" (2) – Load Observer function is enabled. The Load Observer function removes or greatly reduces the effects of load disturbances and provides quicker system response. The output of the Load Observer function is similar to P707 [Load Estimate], but has a filter setting determined by P711 [Load Observer BW]. The Load Observer's output signal will add to the motor torque reference.	Default: 0 = "Disabled" Options: 0 = "Disabled" 1 = "InertiaAdapt" 2 = "LoadObserver"	RW	32-bit Integer
		705	755 Inertia Adapt BW Inertia Adapt Bandwidth Sets the bandwidth of a low pass filter located in the output of the Inertia Adaption function. This parameter should typically be set to match the bandwidth of the drive's speed regulator. This matching setting is automatically made when the Inertia Adaption function is active and the speed regulator bandwidth (P636 [Speed Reg BW]), is set to a non-zero value. If the speed regulator bandwidth is set to zero, then this filter setting must be manually adjusted.	Units: R/S Default: 10.00 Min/Max: 1.00 / 1000.00	RW	Real
		706	755 InertiaAdaptGain Inertia Adaption Gain Sets a multiplier of system inertia used when the Inertia Adaption function is selected P704 [InAdp LdObs Mode] = 1 "InertiaAdapt." This gain has no effect on the parameter P707 [Load Estimate]. Higher gain values may cause high frequency ringing, while smaller values may cause fundamental load instability. This gain should typically range from 0.3 to 1.0 with 0.5 nominal best. The gain setting of 0.5 is automatically made when the speed regulator bandwidth (P636 [Speed Reg BW]), is set to a non-zero value. If the speed regulator bandwidth is set to zero, then this gain setting must be manually adjusted.	Default: 0.500 Min/Max: 0.300 / 1.000	RW	Real
		707	755 Load Estimate Load Estimate Displays an estimated load torque value for the drive. This value is only available in Vector Control mode when using a motor speed feedback device. The load estimate does not include any torque required to accelerate or decelerate the motor. In order to be accurate, the parameter P76 [Total Inertia] must contain a reasonably accurate value.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real
		708	755 InertiaTrqAdd Inertia Torque Adaption Displays the output of the Inertia Adaption function. This value will be subtracted from the motor torque reference, with the result displayed as P689 [Filtered Trq Ref]. The inertia adaption function will be active when operating in Vector Control mode with a motor speed feedback device and P704 [InAdp LdObs Mode] = 1 "InertiaAdapt." A value of 100% represents rated motor torque.	Units: % Default: 0.00 Min/Max: -/+800.00	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
TORQUE CONTROL	Friction Comp	709	<p>755 IA LdObs Delay Inertia Adaption Load Observer Delay</p> <p>Adjusts a filter setting that is applied to the active motor velocity feedback source. The purpose of this filter is to reduce the level of noise present in the feedback signal. Note that this filter is the same type but separate from the filters used to provide P127 [Pri Vel Feedback] and P130 [Alt Vel Feedback]. The derivative of the Sys Control Delay filtered motor velocity signal will be a Motor Acceleration Feedback signal. The Motor Acceleration Feedback is applied to the Inertia Adaption and Load Observer/ Load Estimate functions.</p> <p>This is moving average type filter that has a delay setting of N, where N is an integer number (0, 1, 2 ...). A setting of zero provides no filtering and no delay. Larger values of N result in more filtering and more delay. The best setting for this filter will depend on the level of noise present in the feedback signal and the bandwidth setting of the velocity regulator.</p>	<p>Default: 3 = "50R/S Noise"</p> <p>Options: 0 = "190R/S Noise" 1 = "160R/S Noise" 2 = "100R/S Noise" 3 = "50R/S Noise" 4 = "25R/S Noise" 5 = "12R/S Noise" 6 = "6R/S Noise" 7 = "3R/S Noise"</p>	RW	32-bit Integer
		710	<p>755 InertAdptFiltBW Inertia Adaption Filter Bandwidth</p> <p>Sets the bandwidth of a low pass filter located in the output of the vector control speed regulator and used in connection with the Inertia Adaption function. The bandwidth of this filter should typically be set to five times the bandwidth of the speed regulator. This setting is automatically made when the Inertia Adaption function is active and the speed regulator bandwidth (P636 [Speed Reg BW]), is set to a non-zero value. If the speed regulator bandwidth is set to zero, then this filter setting must be manually adjusted.</p>	<p>Units: R/S</p> <p>Default: 50.00</p> <p>Min/Max: 0.00 / 1000.00</p>	RW	Real
		711	<p>755 Load Observer BW Load Observer Bandwidth</p> <p>Sets the bandwidth of a low pass filter located in the output of the Load Observer function. Typical filter settings range from 10 radians/sec to 150 radians/sec with the higher values being more responsive to disturbances but with increased system noise. There is no nominal best setting, but 40 rad/sec is a suggested starting point. This selection may not function well in sloppy geared systems.</p>	<p>Units: R/S</p> <p>Default: 40.00</p> <p>Min/Max: 1.00 / 1000.00</p>	RW	Real

Drive Position Control File

The digital input assigned by this parameter is equivalent to P731 [Homing Control] Bit 4 "Psn Redefine".	Units: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer																																																					
734	DI OL Home Limit Digital Input Open Loop Home Limit Sets a digital input port for the limit switch of open loop homing function. Polarity of digital input (rising or falling edge) is specified by P731 [Homing Control] Bit 6 "Home DI Inv."	Units: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer																																																					
735	Find Home Speed Find Home Speed Sets the speed and direction that are active when P731 [Homing Control] Bit 0 "Find Home" is active. The sign of the value defines direction ("+" = Forward, "-" = Reverse).	Units: Hz RPM Default: P27 [Motor NP Hz] x 0.1 P28 [Motor NP RPM] x 0.1 Min/Max: P27 [Motor NP Hz] x 0.5 P28 [Motor NP RPM] x 0.5	RW	Real																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Position Homing	736	Find Home Ramp Find Home Ramp Sets the rate of acceleration and deceleration of the Find Home moves.	Units: Secs Default: 10.00 Min/Max: 0.01 / 6554.00	RW	Real
		737	Actual Home Psn Actual Home Position Indicates actual home position after the homing function is complete. The value in this parameter displays the raw position feedback data at home position.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		738	User Home Psn User Home Position Sets user-defined home position. After the homing function is completed, the following parameters are updated with this parameter value; P723 [Psn Command], P815 [Psn Ref EGR Out], P836 [Psn Actual], P837 [Psn Load Actual].	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Position Watch	745 748	PsnWatch1 Select PsnWatch2 Select Position Watch 1 Select Position Watch 2 Select Selects a position feedback source that is compared to the position watch detect-input P746 [PsnWatch1 Dctln], P749 [PsnWatch2 Dctln].	Default: 847 Min/Max: 1 / 159999	RW	32-bit Integer
		746 749	PsnWatch1 Dctln PsnWatch2 Dctln Position Watch 1 Detect Input Position Watch 2 Detect Input Provides position feedback source for the position watch function. The position watch function is enabled and configured by the position control configuration P721 [Position Control]. The position watch function compares this value to the position watch set point P747 [PsnWatch1 Stpt], P750 [PsnWatch2 Stpt] when this parameter P746, P749 is selected by the position watch select P745 [PsnWatch1 Select], P748 [PsnWatch2 Select]. The position detect bit P724 [Psn Reg Status] Bit 9 "PsnW1Detect", Bit 10 "PsnW2Detect" is set when the appropriate condition is satisfied.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		747 750	PsnWatch1 Stpt PsnWatch2 Stpt Position Watch 1 Setpoint Position Watch 2 Setpoint Provides set point for the position watch function. The position watch function is enabled and configured by P721 [Position Control]. The position watch function compares this value to the position feedback source selected by the position watch select P745 [PsnWatch1 Select], P748 [PsnWatch2 Select]. The position detect bit P724 [Psn Reg Status] Bit 9 "PsnW1Detect", Bit 10 "PsnW2Detect" is set when the appropriate condition is satisfied.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Direct	765	Psn Ref Select Position Reference Select Selects a source data for the direct position reference.	Default: 759 Options: 1 / 159999	RW	32-bit Integer
		766	Psn Direct Stpt Position Direct Setpoint Provides set point for the direct position reference. This parameter provides position reference to the position regulator when the Spd/Torq/Pos mode P313 [Actv SpTqPs Mode] is the position direct mode (Option 10) and the position reference select P765 [Psn Ref Select] is the set point.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		767	Psn Direct Ref Position Direct Reference Indicates position direct reference selected by the position reference select P765 [Psn Ref Select].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																						
POSITION CONTROL	Point to Point	770	PTP Control Point-To-Point Control Sets bits to configure the point-to-point position control. Options <table border="1" style="margin-left: 20px;"> <tr> <td></td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Ref Sync</td> <td>Ref Pause</td> <td>Intgrtr Hold</td> <td>Preset Psn</td> <td>Reverse Move</td> <td>Move</td> <td>Vel Override</td> </tr> <tr> <td>Default</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Bit</td> <td>15</td> <td>14</td> <td>13</td> <td>12</td> <td>11</td> <td>10</td> <td>9</td> <td>8</td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> <td></td> </tr> </table> <p>0 = False 1 = True</p> <p>Bit 0 "Vel Override" – Applies the velocity overload P788 [PTP Vel Override] to the forward velocity limit P785 [PTP Fwd Vel Lmt] and the reverse velocity limit P786 [PTP Rev Vel Lmt] as a gain. When the velocity overload P788 [PTP Vel Override] is 1.1 and the forward velocity limit P785 [PTP Fwd Vel Lmt] is 30 Hz, the bit sets the maximum forward velocity to 33 Hz.</p> <p>Bit 1 "Move" – Sets scaled point-to-point position reference to the point-to-point position command P784 [PTP Command]. When the point-to-point mode selection P771 [PTP Mode] is absolute mode (Option 0), the absolute position is set to the point-to-point position command P784 when the bit rises. When the point-to-point mode selection P771 [PTP Mode] is index mode (Option 1), the index position is set to the point-to-point position command P784 when the bit rises.</p> <p>Bit 2 "Reverse Move" – Changes direction of the index position when the point-to-point mode selection P771 [PTP Mode] is index mode (Option 1).</p> <p>Bit 3 "Preset Psn" – Sets index preset P779 [PTP Index Preset] to the point-to-point position command P784 [PTP Command] when the point-to-point mode selection P771 [PTP Mode] is index mode (Option 1).</p> <p>Bit 4 "Intgrtr Hold" – Holds integrator in the velocity control.</p> <p>Bit 5 "Ref Pause" – Pauses functioning of the point-to-point control. The point-to-point speed forward reference becomes zero, and the position selected reference P722 [Psn Selected Ref] keeps current position.</p> <p>Bit 6 "Ref Sync" – Sets initial value to the point-to-point feedback P777 [PTP Feedback].</p>		Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Ref Sync	Ref Pause	Intgrtr Hold	Preset Psn	Reverse Move	Move	Vel Override	Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																												
771	PTP Mode Point-To-Point Mode Selects point-to-point position mode. The point-to-point position control is configured with the following selections. "Absolute" (0) – Absolute position mode "Index" (1) – Index position mode "Immediate" (2) – Absolute immediate position mode	Default: 0 = "Absolute" Options: 0 = "Absolute" 1 = "Index" 2 = "Immediate"	RW	32-bit Integer																																																								
772	DI Indx Step Digital Input Index Step Sets a digital input port for the index position move. The digital input assigned by this parameter is equivalent to the point-to-point move bit P770 [PTP Control] Bit 1 "Move" when the point-to-point mode P771 [PTP Mode] is selected to the index position mode (Option 1).	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer																																																								

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Point to Point	773	DI Indx StepRev Digital Input Index Step Reverse Sets a digital input port for the index position reverse move. The digital input assigned by this parameter is equivalent to the point-to-point reverse move bit P770 [PTP Control] Bit 2 "Reverse Move" when the point-to-point mode P771 [PTP Mode] is selected to the index position mode (Option 1).	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer
		774	DI Indx StepPrst Digital Input Index Step Preset Sets a digital input port for the index preset position. The digital input assigned by this parameter is equivalent to the point-to-point preset position bit P770 [PTP Control] Bit 3 "Preset Psn" when the point-to-point mode P771 [PTP Mode] is selected to the index position mode (Option 1).	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer
		775	PTP Ref Sel Point-To-Point Reference Select Selects a point-to-point reference source that applies to the point-to-point position control.	Default: 780 Min/Max: 1 / 159999	RW	32-bit Integer
		776	PTP Reference Point-To-Point Reference Indicates output of the point-to-point position control as a reference of the position control. When the speed/torque/position mode P313 [Actv SpTqPs Mode] is selected to the point-to-point mode (Option 7) or the profiler mode (Option 6), this parameter value appears on the position selected reference P722 [Psn Selected Ref].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		777	PTP Feedback Point-To-Point Feedback Indicates position feedback in the point-to-point position control.	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		778	PTP Ref Scale Point-To-Point Reference Scale Provides count per scale value for the point-to-point position reference. The value is a multiplier for the point-to-point reference source selected by the reference selection P775 [PTP Ref Sel].	Default: 1.00 Min/Max: -/+220000000.00	RW	Real
		779	PTP Index Preset Point-To-Point Index Preset Provides pre-set index value. The value sets to the point-to-point position command P784 [PTP Command] when the point-to-point mode is index mode P771 [PTP Mode] and the preset position bit P770 [PTP Control] Bit 3 "Preset Psn" is on.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		780	PTP Setpoint Point-To-Point Setpoint Provides set point for the point-to-point position control. The value applies to the point-to-point control when the point-to-point reference selection P775 [PTP Ref Sel] is P780.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		781	PTP Accel Time Point-To-Point Acceleration Time Provides the ramp time for acceleration (time to go from zero to speed limit).	Units: Secs Default: 10.00 Min/Max: 0.00 / 3600.00	RW	Real
		782	PTP Decel Time Point-To-Point Deceleration Time Provides the ramp time for deceleration (time to go from speed limit to zero).	Units: Secs Default: 10.00 Min/Max: 0.00 / 3600.00	RW	Real
		783	PTP Speed FwdRef Point-To-Point Speed Forward Reference Indicates speed reference output from the point-to-point position control. Typically this parameter is used by the drive speed loop.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		784	PTP Command Point-To-Point Command Indicates position command for the point-to-point position control. The source of the position command is selected by the speed/torque/position mode P313 [Actv SpTqPs Mode].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Point to Point	785	PTP Fwd Vel Lmt Point-To-Point Forward Velocity Limit Provides the maximum forward speed reference limit.	Units: Hz RPM Default: P27 [Motor NP Hertz] x 0.5 P28 [Motor NP RPM] x 0.5 Min/Max: 0.00/P27 [Motor NP Hertz] 0.00/P28 [Motor NP RPM]	RW	Real
		786	PTP Rev Vel Lmt Point-To-Point Reverse Velocity Limit Provides the maximum reverse speed reference limit.	Units: Hz RPM Default: P27 [Motor NP Hertz] x 0.5 P28 [Motor NP RPM] x 0.5 Min/Max: 0.00/P27 [Motor NP Hertz] 0.00/P28 [Motor NP RPM]	RW	Real
		787	PTP S Curve Point-To-Point S Curve Provides the amount of time that is applied to the S Curve.	Units: Secs Default: 0.500 Min/Max: 0.000 / 4.000	RW	Real
		788	PTP Vel Override Point-To-Point Velocity Override Provides multiplier to both forward P785 [PTP Fwd Vel Lmt] and reverse P786 [PTP Rev Vel Lmt] speed limits. This parameter applies to the speed limits when the override bit P770 [PTP Control] Bit 0 "Vel Override" is on.	Default: 1.00 Min/Max: 0.20 / 1.50	RW	Real
		789	PTP EGR Mult Point-To-Point Electronic Gear Ratio Multiply EGR multiplier (numerator) for position index output. The output applies to the point-to-point command P784 [PTP Command].	Default: 1 Min/Max: -/+2000000	RW	32-bit Integer
		790	PTP EGR Div Point-To-Point Electronic Gear Ratio Divide EGR divider (denominator) for position index output. The output applies to the point-to-point command P784 [PTP Command].	Default: 1 Min/Max: 1 / 2000000	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																		
POSITION CONTROL	Phase Lock Loop	795	755 PLL Control Phase Locked Loop Control Sets bits to configure the phase locked loop control. Options <table border="1" style="margin-left: 20px;"> <tr> <td></td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Prof Enable</td> <td>PTP Enable</td> <td>PCAM Enable</td> <td>Accel Comp</td> <td>Ext Vel FF</td> <td>Velocity FF</td> <td>PLL Enable</td> </tr> <tr> <td>Default</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Bit</td> <td>15</td> <td>14</td> <td>13</td> <td>12</td> <td>11</td> <td>10</td> <td>9</td> <td>8</td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> </tr> </table> 0 = False 1 = True Bit 0 "PLL Enable" – enables the phase locked loop control. Bit 1 "Velocity FF" – enables the velocity feed forward path. Bit 2 "Ext Vel FF" – enables the external velocity feed forward through the PLL external speed reference selected by the PLL external speed selection P796 [PLL Ext Spd Sel]. Bit 3 "Accel Comp" – enables providing an element of acceleration compensation to the feed forward branch. This is not recommended for use with external inputs because of increased noise. Bit 4 "PCAM Enable" – enables PCAM function with the PLL function. Bit 5 "PTP Enable" – enables point-to-point function with the PLL function. Bit 6 "Prof Enable" – enables profiler function with the PLL function. Only bits 4, 5, and 6 allow associating with the PLL function. 796	755 PLL Ext Spd Sel Phase Locked Loop External Speed Select Selects an external speed reference source.	Default: 797 Options: 1 / 159999	RW	32-bit Integer																																																				

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Phase Lock Loop	797	755 PLL Ext Spd Stpt Phase Locked Loop External Speed Setpoint Provides external speed reference. This parameter is a velocity feed forward input that is selected by the external speed select P796 [PLL Ext Spd Sel].	Default: 0.00 Min/Max: -/+220000000.00	RW	Real
		798	755 PLL Ext SpdScale Phase Locked Loop External Speed Scale Sets scale factor to the external speed reference selected by the external speed select P796 [PLL Ext Spd Sel]. This parameter is used to properly scale the velocity feed forward. Adjust for zero average at the filtered position output P806 [PLL Psn Out Fltr] while running at moderate speed.	Default: 1.00 Min/Max: -/+220000000.00	RW	Real
		799	755 PLL Psn Ref Sel  Phase Locked Loop Position Reference Select Selects a position reference source.	Default: 800 Min/Max: 1 / 159999	RW	32-bit Integer
		800	755 PLL Psn Stpt Phase Locked Loop Position Setpoint Provides position reference when the position reference select P799 [PLL Psn Ref Sel] selects this parameter.	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		801	755 PLL BW Phase Locked Loop Bandwidth Sets internal bandwidth of the PLL function response. The setting for very noisy mechanical systems could range from 1 to 10 (r/s) while well-behaved high line count input devices could range upwards of 100 (r/s). Higher bandwidths will quickly resolve tracking errors while the lower bandwidths will take longer to settle into a steady state. Some adjustment will be necessary to effect the best compromise between noise and tracking response.	Units: R/S Default: 20.00 Min/Max: 0.00 / 8000.00	RW	Real
		802	755 PLL LPFilter BW Phase Locked Loop Low Pass Filter Bandwidth Sets low pass filter bandwidth. The filter has two functions: <ul style="list-style-type: none"> Basic noise reduction of input velocity. Timed delay of input when feed forward is provided to an external master reference other than an input encoder. The filter low pass bandwidth should be set for best tracking which occurs when the filter output coincides with the loop filter output of PLL. Usually that means setting its bandwidth to the bandwidth of the master reference drive.	Units: R/S Default: 50.00 Min/Max: 0.00 / 8000.00	RW	Real
		803	755 PLL Virt Enc RPM Phase Locked Loop Virtual Encoder Revolutions Per Minute Sets RPM of the virtual output device. The value determines the 1 P.U. velocity for the speed out P807 [PLL Speed Out] and does not affect performance.	Units: RPM Default: 1750.00 Min/Max: 1.00 / 40000.00	RW	Real
		804	755 PLL EPR Input Phase Locked Loop Edges Per Revolution Input Sets edges per revolution of the physical input device. Using the highest line count device possible makes insure the smoother PLL operation.	Default: 1048576 Min/Max: 1 / 67108864	RW	32-bit Integer
		805	755 PLL Rvls Input Phase Locked Loop Revolutions Input Sets revolution of the input encoder. This parameter must be coordinated with the revolution of the output encoder P812 [PLL Rvls Output] to resolve the gear-ratio between input revolutions and output (virtual) revolutions. The ratio of input to output revolutions can always be resolved into integer values and should be reduced to their lowest common factor.	Default: 1 Min/Max: 1 / 1000000	RW	32-bit Integer
		806	755 PLL Psn Out Fltr Phase Locked Loop Position Output Filter Indicates internal low pass filter output. This parameter is normally used to properly scale an external velocity reference. See description of the external speed scale P798 [PLL Ext SpdScale].	Default: 0.00 Min/Max: -/+220000000.00	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Phase Lock Loop	807	755 PLL Speed Out Phase Locked Loop Speed Output Indicates velocity output. This parameter is used as a velocity feed forward. It is precisely in phase with the physical input device. The virtual encoder RPM P803 [PLL Virt Enc RPM] determines the RPM at 1 P.U. of this parameter.	Default: 0.00 Min/Max: -/+220000000.00	RO	Real
		808	755 PLL Speed OutAdv Phase Locked Loop Speed Output Advanced Indicates velocity advanced output. This parameter is one velocity reference sample in advance of the speed output P807 [PLL Speed Out].	Default: 0.00 Min/Max: -/+220000000.00	RO	Real
		809	755 PLL Enc Out Phase Locked Loop Encoder Output Indicates position output. This parameter is precisely in phase with the input physical device.	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		810	755 PLL Enc Out Adv Phase Locked Loop Encoder Output Advanced Indicates position advanced output. This parameter is one position sample in advance of the position output P809 [PLL Enc Out].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		811	755 PLL EPR Output Phase Locked Loop Edges Per Revolution Output Sets edges per revolution of virtual the physical output device.	Default: 1048576 Min/Max: 1 / 67108864	RW	32-bit Integer
		812	755 PLL Rvls Output Phase Locked Loop Revolutions Output Sets revolution of the output encoder. This parameter must be coordinated with the revolution of the input encoder P805 [PLL Rvls Input] to resolve the gear-ratio between input revolutions and output (virtual) revolutions. The ratio of input to output revolutions can always be resolved into integer values and should be reduced to their lowest common factor.	Default: 1 Min/Max: 1 / 2000000	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Electronic Gear	815	Psn Ref EGR Out Position Reference Electronic Gear Ratio Output Indicates accumulated output of the position reference electronic gear ratio (EGR) function. When the position regulator is not enabled, this parameter is initialized to P836 [Psn Actual].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		816	Psn EGR Mult Position Electronic Gear Ratio Multiplier Sets integer value in the numerator of the EGR function that is precision multiplied by the position reference. A negative value will effect a change in polarity.	Default: 1 Min/Max: -/+2000000	RW	32-bit Integer
		817	Psn EGR Div Position Electronic Gear Ratio Division Sets integer value in the denominator of the EGR function that divides into the product of the numerator and the position reference. Remainders are accumulated and not lost.	Default: 1 Min/Max: 1 / 2000000	RW	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Position Offset	820	Psn Offset 1 Sel Position Offset 1 Select Selects a Position Offset 1 source.	Default: 821 Min/Max: 1 / 159999	RW	32-bit Integer
		821	Psn Offset 1 Position Offset 1 Provides position reference offset, which is summed after the EGR and used to trim the phase of the position reference. A step in the offset position will be internally rate limited and added to the reference position. The rate of correction is set by the offset velocity P824 [Psn Offset Vel]. The initial value of this parameter is latched upon position enable without causing a change in reference. Subsequent changes to this value will be relative to the latched value. See the offset re-referencing bit P721 [Position Control] Bit 2 "Offset ReRef".	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		822	Psn Offset 2 Sel Position Offset 2 Select Selects a Position Offset 2 source.	Default: 823 Min/Max: 1 / 159999	RW	32-bit Integer
		823	Psn Offset 2 Position Offset 2 Select Provides another position reference offset, which is summed with the position offset 1 P821 [Psn Offset 1] and used to trim the phase of the position reference. The rate of correction is set by the offset velocity P824 [Psn Offset Vel].	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer
		824	Psn Offset Vel Position Offset Velocity Sets speed of position offset. A position offset command will not exceed this speed. The actual speed of offset is limited to a maximum value of 1/(inertia * pos gain) so as not to cause a torque pulse greater than 1 per unit. The speed will change exponentially.	Units: Hz RPM Default: P27 [Motor NP Hertz] x 0.005 P28 [Motor NP RPM] x 0.005 Min/Max: 0.00/P27 [Motor NP Hertz] 0.00/P28 [Motor NP RPM]	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Ld Psn Fdbk Scal	825	755 LdPsn Fdbk Mult Load Position Feedback Multiplier Sets numerator of the load EGR function. It is multiplied by the position load feedback selected by the load feedback select P136 [Load Psn FdbkSel] and divided by the load feedback divider P826 [LdPsn Fdbk Div] to reflect the load pulse count to the motor (effectively removing the gear box ratio). The accumulated position values P836 [Psn Actual] and the position load actual P837 [Psn Load Actual] - will be equal if the ratio is set properly. There may be some difference due to lost motion in the gear train, but there should not be an accumulated difference. It is often necessary to count gear teeth as gear box manufacturers often approximate exact ratios with decimal numbers. Enter a negative value in the numerator to account for reversed motor rotation.	Default: 1 Min/Max: -/+1000000	RW	32-bit Integer
		826	755 LdPsn Fdbk Div Load Position Feedback Division Sets denominator of the load EGR function.	Default: 1 Min/Max: 1 / 2000000	RW	32-bit Integer

File	Group	No.	Name Description	Values		Read-Write	Data Type
				Units:			
POSITION CONTROL	Position Reg	830	PsnNtchFiltrFreq Position Notch Filter Frequency Sets the center frequency of the position notch filter.	Units: Hz Default: 0.00 Min/Max: 0.00 / 500.00		RW	Real
		831	PsnNtchFiltrDepth Position Notch Filter Depth Sets the depth for the position notch filter. Attenuation is the ratio of the output to the input at the notch frequency P830 [PsnNtchFiltrFreq]. The attenuation of 30 means that the notch output is 1/30th of the input at the specified frequency. Calculation: Attenuation = Input / Output	Default: 50.00 Min/Max: 0.00 / 500.00		RW	Real
		832	Psn Out Fitr Sel Position Output Filter Select Selects a type of lead-lag filter for position regulator speed output. This parameter sets filter gain P833 [Psn Out Fitr Sel] and bandwidth P834 [Psn Out Fitr BW] according to the selected type. "Off" (0) – P833 = 1.000, P834 = 0.00 "Custom" (1) – P833 = user setting, P834 = user setting	Default: 0 = "Off" Options: 0 = "Off" 1 = "Custom"		RW	32-bit Integer
		833	Psn Out FitrGain Position Output Filter Gain Sets lead-lag filter gain. A default value is sets when the filter type selection P832 [Psn Out Fitr Sel] is not Custom (Option 1). See the filter type selection P832.	Default: 3.000 Min/Max: -/+5.000		RW	Real
		834	Psn Out Fitr BW Position Output Filter Bandwidth Sets lead-lag bandwidth. A default value is sets when the filter type selection P832 [Psn Out Fitr Sel] is not Custom (Option 1). See the filter type selection P832.	Units: R/S Default: 50.00 Min/Max: 0.00 / 500.00		RW	Real
		835	Psn Error Position Error Indicates actual position error in motor pulse counts as a 32-bit integer. When the position regulator is not enabled, the value is initialized to zero. When the position regulator is enabled, the value contains the running value of position error between the position command P723 [Psn Command] and P836 [Psn Actual].	Default: 0 Min/Max: -2147483648 / 2147483647		RO	32-bit Integer
		836	Psn Actual Position Actual Indicates accumulated motor position as a 32-bit integer. It tracks the position feedback P847 [Psn Fdbk]. When P721 [Position Control] Bit 4 "Zero Psn" is set, this parameter accumulates the value of P847 [Psn Fdbk] - the P725 [Zero Position]. When P721 [Position Control] Bit 4 "Zero Psn" is off, this parameter accumulates the value of P847 [Psn Fdbk].	Default: 0 Min/Max: -2147483648 / 2147483647		RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type
POSITION CONTROL	Position Reg	837	755 Psn Load Actual Position Load Actual Indicates accumulated output of the load gear ratio as a 32-bit integer and forms the primary feedback for the position regulator integral channel. It is very important that the load gear ratio be precisely set such that the delta pulse count of one motor revolution equals the delta pulse count of this parameter.	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer
		838	Psn Reg Ki Position Regulator Ki Sets position regulator integral gain as measured from position error to velocity reference. The value has gain units of (P.U. velocity/sec) / (P.U. position) and is unit compatible with the position regulator proportional gain P839 [Psn Reg Kp]. An integral gain of 25 means that a per unit position error of 0.1 sec will effect a 2.5 P.U. speed change per sec.	Default: 4.00 Min/Max: 0.00 / 1000.00	RW	Real
		839	Psn Reg Kp Position Regulator Kp Sets position regulator gain as measured from position error to speed reference. The gain number is identically equal to position regulator bandwidth in rad/sec. For example: A gain of 10 means that a P.U. position error of 0.1 sec. will effect a 1.0 P.U. speed change (1 per unit position error is the distance traveled in 1 sec. at base motor speed). The maximum value of this parameter is typically 1/3 of the speed bandwidth (rad/sec) but may be set considerably higher with careful tuning of the speed regulator output lead/lag filter.	Units: R/S Default: 4.00 Min/Max: 0.00 / 200.00	RW	Real
		840	PReg Pos Int Lmt Position Regulation Positive Integral Limit Sets positive limit of the position regulator integral output.	Units: % Default: 100.00 Min/Max: 0.00 / 800.00	RW	Real
		841	PReg Neg Int Lmt Position Regulation Negative Integral Limit Sets negative limit of the position regulator integral output.	Units: % Default: -100.00 Min/Max: -800.00 / 0.00	RW	Real
		842	PsnReg IntgrlOut Position Regulation Integral Output Indicates output of the position regulator integral channel after the limit function.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		843	PsnReg Spd Out Position Regulation Speed Output Indicates final output of the position regulator.	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RO	Real
		844	PReg Pos Spd Lmt Position Regulation Positive Speed Limit Sets positive speed limit of total position regulator output.	Units: % Default: 10.00 Min/Max: 0.00 / 800.00	RW	Real
		845	PReg Neg Spd Lmt Position Regulation Negative Speed Limit Sets negative speed limit of total position regulator output.	Units: % Default: -10.00 Min/Max: -800.00 / 0.00	RW	Real
		846	Psn Reg Droop Position Regulation Droop Sets position droop which limits the low frequency gain of the position regulators integral channel to a value of (1/droop). This parameter provides a means to fine tune the stability for load mounted feedback devices where lost motion may cause a problem. Typically, the position droop will have a value that is less than (1/position gain), perhaps even zero for tightly coupled loads. The position droop has a gain value of (P.U. position) / (P.U. speed). Note: 1 P.U. position is the distance traveled in 1 sec. at base motor speed.	Units: Secs Default: 0.00 Min/Max: 0.00 / 25.00	RW	Real
		847	Psn Fdbk Position Feedback Indicates the accumulated pulse count of the position feedback selected by the position feedback select [P135].	Default: 0 Min/Max: -2147483648 / 2147483647	RO	32-bit Integer

APPLICATIONS	Torque Prove	1102	755 DI FloatMicroPsn Digital Input Float Micro Position Selects the digital input to be used for the float / micro position functions.	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer
		1103	755 Trq Prove Status Torque Prove Status Displays the status bits for TorqProve. Options Reserved Reserved Reserved Reserved Reserved Reserved Reserved Reserved Encoderless RefLoadLmted LoadTestActv Brake Set BrkSlip1 Alm Micro Psn DecelLmtActv EndLimitActv Default 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 Bit 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 0 = Disabled 1 = Enabled			
		1104	755 Trq Lmt SlewRate Torque Limit Slew Rate Sets the rate to ramp the torque limits to zero during brake proving.	Units: Secs Default: 10.000 Min/Max: 0.500 / 300.000	RW	Real
		1105	755 Speed Dev Band Speed Deviation Band The amount of allowable deviation between the commanded speed and the actual speed (from a feedback device). When this value is exceeded for the amount of time in P1106, a fault will occur.	Units: Hz RPM Default: P27 [Motor NP Hertz] x 0.0334 P28 [Motor NP RPM] x 0.0334 Min/Max: P27 x 0.0016 / P27 x 0.25 P28 x 0.0016 / P28 x 0.25	RW	Real
		1106	755 SpdBand Intgrtr Speed Band Integer The amount of time for which the actual speed is allowed to exceed P1105 [Speed Dev Band] before a fault occurs.	Units: Secs Default: 0.060 Min/Max: 0.001 / 0.200	RW	Real
		1107	755 Brk Release Time Brake Release Time Sets the time between the brake release command and when the drive begins to accelerate. In Encoderless mode, this parameter sets the time to release the brake after drive starts.	Units: Secs Default: 0.100 Min/Max: 0.000 / 10.000	RW	Real
		1108	755 Brk Set Time Brake Set Time Defines the amount of delay time between commanding the brake to be set and the start of brake proving.	Units: Secs Default: 0.100 Min/Max: 0.000 / 10.000	RW	Real
		1109	755 Brk Alarm Travel Brake Alarm Travel Sets the number of motor shaft revolutions allowed during the brake slippage test. Drive torque is reduced to check for brake slippage. When slippage occurs, the drive allows this number of motor shaft revolutions before regaining control. Not used when P1100 [Trq Prove Cfg] Bit 1 "Encoderless" = 1 (enabled).	Default: 1.00 Min/Max: 0.00 / 1000.00	RW	Real
		1110	755 Brk Slip Count Brake Slip Count Sets the number of encoder counts to define a brake slippage condition. Not used when P1100 [Trq Prove Cfg] Bit 1 "Encoderless" = 1 (enabled).	Default: 250.00 Min/Max: 0.00 / 65535.00	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
APPLICATIONS	Fiber Functions	1124	753 Traverse Dec Traverse Decrement Sets the time period in seconds of decreasing speed for the Fiber Traverse function.	Units: Secs Default: 0.00 Min/Max: 0.00 / 30.00	RW	Real
		1125	753 Max Traverse Maximum Traverse Sets the amplitude of the triangle wave speed modulation for the Fiber Traverse function. The total speed variation will be twice this value, from speed ref plus Max Traverse to speed ref minus Max Traverse.	Units: Hz Default: 0.00 Min/Max: 0.00 / P520 [Max Fwd Speed]	RW	Real
		1126	753 P Jump Position Jump Sets the amplitude of the square wave speed modulation for the Fiber Traverse function. This speed is alternately added to and subtracted from the speed reference together with the [Max Traverse] triangle speed modulation.	Units: Hz Default: 0.00 Min/Max: 0.00 / P520 [Max Fwd Speed]	RW	Real
		1129	753 DI Fiber SyncEna Digital Input Fiber Synchronize Enable Selects a digital input source for the Fiber Application Functions's synchronous speed change routine. Used in combination with the [Fiber Control] Sync Enable bit.	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer
		1130	753 DI Fiber TravDis Digital Input Fiber Traverse Disable Selects a digital input source for the Fiber Application Traverse Routine. This is an inverted input, so the Traverse Routine is disabled when the input is active (set). Used in combination with the [Fiber Control] Traverse Ena bit.	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer

		1133	753 Adj Vltg Select Adjustable Voltage Reference Select Selects the source of the voltage reference to the drive.	Default: 0 Min/Max: 0 / 159999	RW	32-bit Integer																																																			
		1134	753 Adj Vltg Ref Hi Adjustable Voltage Reference High Scales the upper value of the P1133 [Adj Vltg Select] selection when the source is an analog input.	Units: % Default: 0.00 Min/Max: +/-100.00 of Drive Rated Volts	RW	Real																																																			
1135	753 Adj Vltg Ref Lo Adjustable Voltage Reference Low Scales the lower value of the P1133 [Adj Vltg Select] selection when the source is an analog input.	Units: % Default: 0.00 Min/Max: +/-100.00 of Drive Rated Volts	RW	Real																																																					
1136	753 Adj Vltg TrimSel Adjustable Voltage Trim Select Selects the source of the voltage trim that is added to or subtracted from the voltage reference.	Default: 0 Min/Max: 0 / 159999	RW	32-bit Integer																																																					
1137	753 Adj Vltg Trim Hi Adjustable Voltage Trim High Scales the upper value of the P1136 [Adj Vltg TrimSel] selection when the source is an analog input.	Units: % Default: 0.00 Min/Max: +/-100.00 of Drive Rated Volts	RW	Real																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
APPLICATIONS	Adjustable Vltg	1138	753 Adj Vltg Trim Lo Adjustable Voltage Trim Low Scales the lower value of the P1136 [Adj Vltg TrimSel] selection when the source is an analog input.	Units: % Default: 0.00 Min/Max: -/+100.00 of Drive Rated Volts	RW	Real
		1139	753 Adj Vltg Command Adjustable Voltage Command Displays the voltage value of the reference specified in P1133 [Adj Vltg Select].	Units: VAC Default: 0.0 Min/Max: 0.0 / Drive Rated Volts	RO	Real
		1140	753 Adj Vltg AccTime Adjustable Voltage Acceleration Time Sets the rate of voltage increase. The value will be the time it takes to ramp the voltage from P1152 [Min Adj Voltage] to P36 [Maximum Voltage]. An "S" curve can be applied to the ramp using P1150 [Adj Volt Scurve].	Units: Secs Default: 0.0 Min/Max: 0.0 / 3600.0	RW	Real
		1141	753 Adj Vltg DecTime Adjustable Voltage Deceleration Time Sets the rate of voltage decrease. The value will be the time it takes to ramp the voltage from P36 [Maximum Voltage] to P1152 [Min Adj Voltage]. An "S" curve can be applied to the ramp using P1150 [Adj Volt Scurve]. Important: This ramp and P142/143 [Decel Time X] must ramp to zero for drive to Stop.	Units: Secs Default: 0.0 Min/Max: 0.0 / 3600.0	RW	Real
		1142	753 Adj Vltg Preset1	Units: VAC Default: 0.0 Min/Max: 0.0 / Drive Rated Volts	RW	Real
		1143	753 Adj Vltg Preset2			
		1144	753 Adj Vltg Preset3			
		1145	753 Adj Vltg Preset4			
		1146	753 Adj Vltg Preset5			
		1147	753 Adj Vltg Preset6			
		1148	753 Adj Vltg Preset7 Adjustable Voltage Preset 1...7 Provides an internal fixed voltage command value that is available as a selection for P1133 [Adj Vltg Select].			
		1149	753 Adj Vltg RefMult Adjustable Voltage Reference Multiplier Scales the voltage reference value from the reference source.	Units: % Default: 0.00 Min/Max: -/+100.00 of Drive Rated Volts	RW	Real
		1150	753 Adj Vltg Scurve Adjustable Voltage S Curve Sets the percentage of accel or decel time to be applied to the voltage ramp as "S" curve. Time is added 1/2 at the beginning and 1/2 at the end.	Units: % Default: 0.0 Min/Max: 0.0 / 100.0	RW	Real
1151	753 Adj Vltg TrimPct Adjustable Voltage Trim Percentage Scales the total voltage trim value from all sources. Analog In 1 and 2 are scaled separately with P1137 [Adj Vltg Trim Hi] and P1138 [Adj Vltg Trim Lo] then [Adj Vltg TrimPct] sets the trim value. The sign of this value will determine if trim is added or subtracted from the reference.	Units: % Default: 0.00 Min/Max: -/+100.00 of Drive Rated Volts	RW	Real		
1152	753 Min Adj Voltage Minimum Adjustable Voltage Sets the low limit for the voltage reference when P35 [Motor Ctrl Mode] is set to 9 "Adj Voltage."	Units: VAC Default: 0.0 Min/Max: 0.0 / Drive Rated Volts	RW	Real		

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																
APPLICATIONS	Pump Jack	1165	753 Rod Speed Rod Speed Displays the speed in RPMs of the pump rod after the gearbox and sheaves.	Units: RPM Default: 0.00 Min/Max: 0.00 / 10000.00	RO	Real																																																
		1166	753 Rod Torque Rod Torque Displays the load side torque. P1174 [Total Gear Ratio] must be greater than zero to activate this display.	Units: FtLb Default: 0.00 Min/Max: 0.00 / 10000.00	RO	Real																																																
		1167	753 Rod Speed Cmd Rod Speed Command Displays the commanded speed in RPMs of the pump rod after the gearbox and sheaves.	Units: RPM Default: 0.00 Min/Max: 0.00 / 10000.00	RO	Real																																																
		1168	753 TorqAlarm Action  Torque Alarm Action Sets the drive action when the Torque Alarm is exceeded. Note: only active with PC pump applications. See P1179 [OilWell Pump Cfg].	Default: 0 = "Ignore" Options: 0 = "Ignore" 1 = "Preset Spd 1"	RW	32-bit Integer																																																
		1169	753 TorqAlarm Config  Torque Alarm Configure Enables the Torque Alarm function. 1189	753 Pump Off Action Pump Off Action Selects the action to be taken after a Pump-Off condition has been detected.	Default: 0 = "Change Speed" Options: 0 = "Change Speed" 1 = "Always Stop" 2 = "Stop After 1" 3 = "Stop After 2"	RW	32-bit Integer																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
APPLICATIONS	Pump Off	1204	753 Pump Off SleepCnt Pump Off Sleep Count Displays the number of times a sleep condition has occurred since this parameter was reset.	Default: 0.00 Min/Max: 0.00 / 60000.00	RW	Real
		1205	753 Day Stroke Count Day Stroke Count Displays the number of strokes for the past 24 hours. This is a rolling counter updated every hour.	Default: 0.00 Min/Max: 0.00 / 65535.00	RO	Real
		1206	753 DI PumpOff Disbl Digital Input Pump Off Disable Selects the digital input source for the Pump Off Disable function.	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer
		1207	753 Pump OffSleepLvl Pump Off Sleep Level Provides a source for P351 [SleepWake RefSel]. This provides the start/stop control of the drive by the Pump-Off function.	Units: Secs Default: 0.00 Min/Max: 0.00 / 10.00	RO	32-bit Integer

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																																																																					
APPLICATIONS	Profiling	1210	755 Profile Status Profile Status Indicates status of speed profile/position indexer control logic. Options <table border="1"> <tr> <td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Home Not Set</td><td>Vel Override</td><td>Restart Step</td><td>Resume</td><td>Stopped</td><td>Complete</td><td>In Position</td><td>Holding</td><td>Dwell</td><td>PositionMode</td><td>Running</td><td>Enabled</td><td>Reserved</td><td>Reserved</td><td>Reserved</td><td>Step Bit 4</td><td>Step Bit 3</td><td>Step Bit 2</td><td>Step Bit 1</td><td>Step Bit 0</td> </tr> <tr> <td>Default</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>Bit</td><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td> </tr> </table> 0 = False 1 = True Bit 0 "Step Bit 0" – Bit 0 through Bit 4 indicate executing step number in the move table in binary format. Bit 1 "Step Bit 1" Bit 2 "Step Bit 2" Bit 3 "Step Bit 3" Bit 4 "Step Bit 4" Bit 8 "Enabled" – Indicates that the profile control logic is enabled. When the drive is started with the profiler selection (Option 6) in the speed/torque/ position mode P313 [Actv SpTqPs Mode], this bit turns on. Bit 9 "Running" – Indicates that the profile control logic is in running state. Bit 10 "PositionMode" – Indicates that the profile control logic is using position control logic. Bit 11 "Dwell" – Indicates that the profile control logic is in dwell state. Bit 12 "Holding" – Indicates that the profile control logic is in holding states Bit 13 "In Position" – Indicates that the target position has been reached at the completion of a move. The in position bandwidth P726 [In Pos Psn Band] can be adjusted to affect when this bit is set with respect to the target position. This bit will be cleared when a new move is begun Bit 14 "Complete" – Indicates that all steps in the move table have been executed and a step with a End action has been reached. The profile control logic is complete. This bit will be cleared when the profile is first enabled. Bit 15 "Stopped" – Indicates that the profile control logic stops the drive following Bit 14 "Complete" and any additional dwell time specified for the End step. This bit will be cleared when a new profile is begun. Bit 16 "Resume" – Indicates that an existing step is to resume execution when the profile is enabled. A previously running step will then be allowed to complete. When the bit is clear, the profile will begin at its Starting Step. Bit 17 "Restart Step" – Follows the state of the restart step bit in P1213 [Profile Command] Bit 10 "Restart Step". Bit 18 "Vel Override" – Follows the state of the velocity override bit in P1213 [Profile Command] Bit 9 "Vel Override". Bit 19 "Home Not Set" – Indicates that the home position is not defined and the move table contains a position absolute move type. When this bit is set the profile will not be allowed to execute. This bit will be cleared when either a homing function or position redefine function is completed. APPLICATIONS Profiling	Profiling	1212	755 Units Traveled Units Traveled Indicates total number of units traveled. The relationship between the feedback edge counts and the position units is determined by the P1215 [Counts Per Unit]. Actual motor position is converted from the edge counts to this value using the P1215 [Counts Per Unit].	Units: Cnts Default: Read Only Min/Max: -/+ 2200000000.0	RO	Real																																																		
		1213	755 Profile Command Profile Command Sets bits to configure the speed profile/position indexer control logic. Options <table border="1" style="margin-left: 20px; border-collapse: collapse; text-align: center;"> <tr> <td></td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>Prof Run Alm</td> <td>HomNotSetAlm</td> <td>Restart Step</td> <td>Vel Override</td> <td>Hold Step</td> <td>Reserved</td> <td>Reserved</td> <td>Reserved</td> <td>StrStepSel4</td> <td>StrStepSel3</td> <td>StrStepSel2</td> <td>StrStepSel1</td> <td>StrStepSel0</td> </tr> <tr> <td>Default</td> <td>0</td> <td>0</td> <td>0</td> <td>1</td> <td>1</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Bit</td> <td>15</td> <td>14</td> <td>13</td> <td>12</td> <td>11</td> <td>10</td> <td>9</td> <td>8</td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> </tr> </table> 0 = Disabled 1 = Enabled Bit 0 "StrStepSel0" – Bit 0 through Bit 4 set initial or starting step in the move table in binary format. A starting step value of zero results in no motion when the drive is enabled. Bit 1 "StrStepSel1" Bit 2 "StrStepSel2" Bit 3 "StrStepSel3" Bit 4 "StrStepSel4" Bit 8 "Hold Step" – When the drive is enabled with this bit is set, the drive starts and runs at zero velocity. The starting step is not executed until the 'Hold Step' bit is removed. For non-blended moves, the drive will hold zero speed and/or current position. This does not stop the drive. For blended moves, the drive will continue to run at the step velocity. If the Hold Step bit is removed, then the conditions required to complete the step can be evaluated. Bit 9 "Vel Override" – can be used to rescale all move velocities by the velocity override P1216 [ProfVel Override]. When this bit is off, a scale factor of 1 is used. Bit 10 "Restart Step" – can be used to disable a currently executing profile. This bit forces the current step to reset to the starting step value. Bit 11 "HomNotSetAlm" – sets condition to indicate the "home position not set" alarm. The absolute position type will work without home position if the bit is off. Set on as default. Bit 12 "Prof Run Alm" – sets condition to indicate the profile running alarm during the drive is running. Set on as default. 		1380	755 Step 16 Type				
							Step 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 Type Set type of move for a particular step. The possible step types are: "Speed" (0) = Speed Profile moves in speed mode. "Position Abs" (1) = Position Absolute moves in absolute position mode. "PositionIncr" (2) = Position Incremental moves in position increment mode. The drive must have the direction mode set to the bipolar for the position regulator to function properly. The current, torque, and regen power limits must be set so as not to limit the programmed deceleration time. If the limits occur, the position regulator may overshoot the position set point.
		1231	755 Step 1 Velocity	Units: Hz RPM Default: 0.00 Min/Max: -/+P27 [Motor NP Hertz] x 8 -/+P28 [Motor NP RPM] x 8	RW	Real

1351	755 Step 13 Velocity						
1361	755 Step 14 Velocity						
1371	755 Step 15 Velocity						
1381	755 Step 16 Velocity						
		Step 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 Velocity Set speed at which a move will take place. The step velocity applies to all three types of moves – position absolute, position incremental, and speed profile. The motor may not achieve the step velocity in all cases. Short distance moves may begin to decelerate before the step velocity is reached. If the move is sufficiently long, then the motor speed will be limited to the step velocity. Sign on the step velocity is used to determine direction of motor rotation. Cannot be used with most blended moves in Position Absolute type and Position Incremental type.

			These parameters can take on any one of several meanings depending on the move type and action. The possible meanings for these parameters are given below. All other type/action combinations will be ignored.				
			[Type] = Position Absolute [Action] = Posit Blend, Wait Dig-in, or Step to Next [Value] is the Absolute Target Position				
			[Type] = Position Incremental [Action] = Posit Blend, Wait Dig-in, or Step to Next [Value] is the Incremental Target Position				
			[Type] = Speed Profile [Action] = Posit Blend [Value] is the Incremental Target Position				
			[Type] = Speed Profile [Action] = Time Blend, Wait Dig-in, or Step to Next [Value] is the Total Time to complete the move. Time is specified in 1/100ths of a second (1000 = 10.00 sec). Negative values result in time = 0 sec (no move)				
			[Type] = Speed Profile [Action] = Parameter Blend [Value] is the parameter number to compare against the parameter set-point specified in the dwell parameter. Positive numbers will use a greater than check, negative numbers will use a less than check.				
			1235	755 Step 1 Dwell	Units: Secs Default: 0.00 Min/Max: -1.00 / 3600.00	RW	Real
			1245	755 Step 2 Dwell			
			1255	755 Step 3 Dwell			
			1265	755 Step 4 Dwell			
			1275	755 Step 5 Dwell			
	1285	755 Step 6 Dwell					
	1295	755 Step 7 Dwell					
	1305	755 Step 8 Dwell					
	1315	755 Step 9 Dwell					
	1325	755 Step 10 Dwell					
	1335	755 Step 11 Dwell					
	1345	755 Step 12 Dwell

	1365	755 Step 14 Dwell					
	1375	755 Step 15 Dwell					
	1385	755 Step 16 Dwell					
	Step 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 Dwell						
	Set time delay between moves. P1210 [Profile Status] Bit 11 "Dwell" will be set to indicate that the step dwell period is active and timing. Zero value will disable dwell, negative value will wait forever. Not all steps can use dwell (example, most blended moves cannot use dwell). When the speed type with the parameter blend action move is used, the step dwell parameter will contain the parameter number of the set-point value to compare with the parameter selected in the value parameter.

		1368	755 Step 14 Action				
		1378	755 Step 15 Action				
		1388	755 Step 16 Action				
				Step 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 Action Set what is to be done at the end of a step after the move is complete. End (0) = End stops the move sequence. Step to Next (1) = Step to Next moves to the next step after the speed ramp up/down is completed in the specific total time. The dwell time and the batch can be applied. Psn Blend (2) = Posit Blend moves to the next step after the actual position becomes greater than the position specified in the value parameter. Time Blend (3) = Time Blend moves to the next step after the total running time becomes greater than the time specified in the value parameter. Param Blend (4) = Param Blend moves to the next step after comparison of two parameters is satisfied. The parameters for comparison are specified in the value and dwell parameter. DigIn Blend (5) = DigIn Blend moves to the next step after the specified number of digital input rising (or falling) edges are applied. The batch parameter specifies the number of digital input edges. Wait DigIn (6) = Wait DigIn moves to the next step after the digital input rising (or falling) edges are applied.			
		1239	755 Step 1 Dig In	Default: 0.00 Min/Max: 0.00 / 159999.15	RW	32-bit Integer

		1279	755 Step 5 Dig In				
		1289	755 Step 6 Dig In				
		1299	755 Step 7 Dig In				
		1309	755 Step 8 Dig In				
		1319	755 Step 9 Dig In				
		1329	755 Step 10 Dig In				
1339	755 Step 11 Dig In						
1349	755 Step 12 Dig In						
1359	755 Step 13 Dig In						
1369	755 Step 14 Dig In						
1379	755 Step 15 Dig In						
1389	755 Step 16 Dig In						
		 Step 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 Digital Input Set digital input sources. Not all steps use the digital input for the step move. The following type and action moves use the dig-in parameters to specify the digital input sources. Polarity (rising or falling edges) of digital input is set by P1217 [Prof DI Invert]. 1. [Type] Position Absolute [Action] Wait DigIn 2. [Type] Position Incremental [Action] Wait DigIn 3. [Type] Speed Profile [Action] DigIn Blend 4. [Type] Speed Profile [Action] Wait DigIn

		1391	<p>755 PCAM Mode Position Camming Mode The parameter sets type of operational mode. "Off" (0) – Disable position CAM function "Single Step" (1) – At rising edge of Start (P1390 [PCAM Control]), the CAM profile begins at point 0 and runs until the x-axis has reached the last point defined by the end point (P1405 [PCAM Main EndPnt] and P1439 [PCAM Aux EndPnt]) at which point it is completed. If the x-axis then backs up into CAM range, nothing happens; the profile has already completed and won't restart until control Start (P1390 [PCAM Control]) is once again set. "Continuous" (2) – At rising edge of Start (P1390 [PCAM Control]), the CAM profile begins at point 0 and runs to the end point (P1405 [PCAM Main EndPnt] and P1439 [PCAM Aux EndPnt]), and then repeats forever or until the control bit Start (P1390 [PCAM Control]) is cleared. "Persistent" (3) – At rising edge of Start (P1390 [PCAM Control]), the CAM profile begins at point 0 and runs to the end point (P1405 [PCAM Main EndPnt] and P1439 [PCAM Aux EndPnt]), and remains active until the control bit Start (P1390 [PCAM Control]) is cleared.</p>	Default: 0 = "Off" Options: 0 = "Off" 1 = "Single Step" 2 = "Continuous" 3 = "Persistent"	RW	32-bit Integer																																																			
		1392	<p>755 PCAM Psn Select Position Camming Position Select The parameter selects a position reference source for x-axis.</p>	Default: 1393 Options: 1 / 159999	RW	32-bit Integer																																																			
		1393	<p>755 PCAM Psn Stpt Position Camming Position Setpoint The parameter provides position reference for x-axis when the position reference select (P1392 [PCAM Psn Select]) selects this parameter.</p>	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer																																																			
		1394	<p>755 PCAM Psn Ofst Position Camming Position Offset The parameter provides position offset value to x-axis position when the offset enable control bit (P1390 [PCAM Control]) is set. The offset value causes a phase shift or position change in x-axis and a momentary change to CAM speed.</p>	Default: 0 Min/Max: -2147483648 / 2147483647	RW	32-bit Integer																																																			
1395	<p>755 PCAM PsnOfst Eps Position Camming Position Offset Eps The parameter provides count of edges per second for virtual encoder function. The value makes a limit on change of x-axis position in change of position offset input.</p>	Default: 2000 Min/Max: 0 / 2147483647	RW	32-bit Integer																																																					
1396	<p>755 PCAM Span X Position Camming Span X The parameter provides the number of integer counts equivalent to the span or range of x-axis.</p>	Default: 8192 Min/Max: 0 / 2147483647	RW	32-bit Integer																																																					

File	Group	No.	Name Description	Values	Read-Write	Data Type
APPLICATIONS	Camming	1397	755 PCAM Scale X Position Camming Scale X The parameter multiplies span x (P1396 [PCAM Span X]) such that the x-axis dimension will expand if this parameter is greater than 1.	Default: 1.00 Min/Max: 0.01 / 214748000.00	RW	Real
		1398	755 PCAM Span Y Position Camming Span Y The parameter provides the number of edges equivalent to the span of the y-axis. The value is the number of integer counts representing the maximum vertical extent of the profile.	Default: 8192 Min/Max: 0 / 2147483647	RW	32-bit Integer
		1399	755 PCAM ScaleY Sel Position Camming Scale Y Select The parameter selects a source for y scale.	Default: 1400 Options: 1 / 159999	RW	32-bit Integer
		1400	755 PCAM ScaleYSetPt Position Camming Scale Y Setpoint The parameter provides y-axis scale when the y scale select (P1399 [PCAM ScaleY Sel]) selects this parameter. The y scale multiplies the y span such that the y-axis dimension will increase if y scale is greater than 1.	Default: 1.00 Min/Max: 0.01 / 214748000.00	RW	Real
		1401	755 PCAM VelScaleSel Position Camming Velocity Scale Select The parameter selects a source for velocity scale.	Default: 1402 Options: 1 / 159999	RW	32-bit Integer
		1402	755 PCAM VelScaleSP Position Camming Velocity Scale Setpoint The parameter provides velocity scale when the velocity scale select (P1401 [PCAM VelScaleSel]) selects this parameter. The velocity scale multiplies the velocity output (P1472 [PCAM Vel Out]) such that the velocity output (P1472) will decrease if the velocity scale is less than 1.	Units: MPE Default: 0.000100 Min/Max: 0.000000 / 8.000000	RW	Real
		1403	755 PCAM Slope Begin Position Camming Slope Begin The parameter provides beginning slope at CAM point 0. The parameter is used only if the segment is cubic type curve.	Default: 0.00 Min/Max: -214748000.00 / 214748000.00	RW	Real
		1404	755 PCAM Slope End Position Camming Slope End The parameter provides ending slope at CAM point 0. The parameter is used only if the segment is cubic type curve in both the main and the auxiliary CAM profile.	Default: 0.00 Min/Max: -214748000.00 / 214748000.00	RW	Real
		1405	755 PCAM Main EndPnt Position Camming Main End Point The parameter provides a number of the last CAM point used in the main CAM profile.	Default: 0 Options: 1 / 15	RW	32-bit Integer
		1406	755 PCAM Main Types Position Camming Main Types Each bit sets curve type for each segment in the main CAM profile. If the bit is clear, the curve is linear at the point of segment in the main CAM profile. If the bit is set, the curve is cubic at the point of segment in the main CAM profile.	Options CubicCurve15 CubicCurve14 CubicCurve13 CubicCurve12 CubicCurve11 CubicCurve10 CubicCurve9 CubicCurve8 CubicCurve7 CubicCurve6 CubicCurve5 CubicCurve4 CubicCurve3 CubicCurve2 CubicCurve1 CubicCurve0 Default 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 Bit 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 0 = Disabled 1 = Enabled

		34	Fbk 2 Units Selects rotary or linear feedback for safety option 2.	Default: 0 = "Rev" Options: 0 = "Rev" (Rotary) 1 = "mm" (Linear)	RW	Real
		35	Fbk 2 Polarity Defines the direction polarity for encoder 2.	Default: 0 = "Normal" Options: 0 = "Normal" (Same as encoder) 1 = "Reversed"	RW	Real
		36	Fbk 2 Resolution Counts/Revolution. 0...65,535 pulses/revolution or pulses/mm based on rotary or linear configuration defined by P34 [Fbk 2 Units].	Default: 0 Min/Max: 1 / 65,535	RO	Real
		37	Fbk 2 Volt Mon Encoder 2 voltage to be monitored.	Default: 0 = Voltage not monitored Options: 0 = Voltage not monitored 5 = 5V +/- 5% 9 = 7...12V 12 = 12V +/- 5% 24 = 24V - 10%...24V + 5%	RW	Real
		38	Fbk 2 Speed Displays the output speed of encoder 2. Units based on rotary or linear configuration defined by P34 [Fbk 2 Units].	Units: RPM mm/s Min/Max: -214,748,364.8 / 214,748,364.7 RPM -214,748,364.8 / 214,748,364.7 mm/s	RO	Real
		39	Fbk Speed Ratio Defines the ratio of the expected speed of encoder 2 divided by the expected speed of encoder 1. Ratio based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Default: 0.0000 Min/Max: 0.0001 / 10,000.0	RW	Real
		40	Fbk Speed Tol Acceptable difference in speed between P33 [Fbk 1 Speed] and P38 [Fbk 2 Speed]. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: RPM mm/s Min/Max: 0 / 6553.5 RPM 0 / 6553.5 mm/s	RW	Real
		41	Fbk Pos Tol Acceptable difference in position between encoder 1 and encoder 2. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: Deg mm Default: 0 Min/Max: 0 / 65,535 deg 0 / 65,535 mm	RW	Real
		42	Direction Mon Defines the allowable direction if Safe Direction Monitoring is enabled. "Pos Always" (1) – Positive always "Neg Always" (2) – Negative always "Pos in SLS" (3) – Positive during safe limited speed monitoring "Neg in SLS" (4) – Negative during safe limited speed monitoring	Default: 0 = "Disabled" Options: 0 = "Disabled" 1 = "Pos Always" 2 = "Neg Always" 3 = "Pos in SLS" 4 = "Neg in SLS"	RW	Real
		43	Direction Tol The position limit in encoder units tolerated in the wrong direction when Safe Direction Monitoring is active. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: Deg mm Default: 10 Min/Max: 0 / 65,535 deg 0 / 65,535 mm	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS	Stop	44	Safe Stop Input Configuration for Safe Stop input (SS_In). "2NC" (1) – Dual-channel equivalent "2 NC 3s" (2) – Dual-channel equivalent 3 s "1 NO + 1 NC" (3) – Dual-channel complementary "1 NO + 1 NC 3s" (4) – Dual-channel complementary 3 s "2 OSSD" (5) – Dual-channel SS equivalent "1 NC" (6) – Single channel equivalent	Default: 1 = "2NC" Options: 0 = "Not used" 1 = "2NC" 2 = "2 NC 3s" 3 = "1 NO + 1 NC" 4 = "1 NO + 1 NC 3s" 5 = "2 OSSD" 6 = "1 NC"	RW	Real
		45	Safe Stop Type Safe operating stop type selection. This defines the type of Safe Stop that is performed if the Safe Stop function is initiated by a stop type condition. "Torque Off" (0) – Safe Torque Off With Standstill Checking "Torque Off NoCk" (3) – Safe Torque Off Without Standstill Checking	Default: 0 = "Torque Off" Options: 0 = "Torque Off" 1 = "Safe Stop 1" 2 = "Safe Stop 2" 3 = "Torque Off NoCk"	RW	Real
		46	Stop Mon Delay Defines the monitoring delay between the request and the Max Stop Time when the request for a Safe Stop 1 or a Safe Stop 2 is initiated by an SS_In input ON to OFF transition. If the Safe Stop Type is Safe Torque Off With or Without Standstill Speed Checking, the Stop Monitor Delay must be 0 or a Invalid Configuration Fault occurs.	Units: Secs Default: 0 Min/Max: 0 / 6553.5	RW	Real
		47	Max Stop Time Defines the maximum stop delay time that is used when the Safe Stop function is initiated by a stop type condition.	Units: Secs Default: 0 Min/Max: 0 / 6553.5	RW	Real
		48	Standstill Speed Defines the speed limit that is used to declare motion as stopped. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: RPM mm/s Default: 0.001 Min/Max: 0.001/ 65.535 RPM 000/ 65.535 mm/s	RW	Real
		49	Standstill Pos Defines the position limit window in encoder 1 degrees or mm that will be tolerated after a safe stop condition has been detected. Degrees (360° = 1 revolution) or mm based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: Deg mm Default: 10 Min/Max: 0 / 65,535 deg 0 / 65.535 mm	RW	Real
		50	Decel Ref Speed Determines deceleration rate to monitor for Safe Stop 1 or Safe Stop 2. Units are based on rotary or linear configuration defined by encoder 1 feedback configuration, P29 [Fbk 1 Units].	Units: RPM mm/s Default: 0 Min/Max: 0 / 65,535 RPM 0 / 65,535 mm/s	RW	Real
51	Stop Decel Tol This is the acceptable tolerance above the deceleration rate set by the Decel Ref Speed parameter.	Units: % Default: 0 Min/Max: 0 / 100	RW	Real		

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS	Limited Speed	52	Lim Speed Input Configuration for Safe Limited Speed input (SLS_In). "2NC" (1) – Dual-channel equivalent "2 NC 3s" (2) – Dual-channel equivalent 3 s "1 NO + 1 NC" (3) – Dual-channel complementary "1 NO + 1 NC 3s" (4) – Dual-channel complementary 3 s "2 OSSD" (5) – Dual-channel SS equivalent "1 NC" (6) – Single channel equivalent	Default: 0 = "Not used" Options: 0 = "Not used" 1 = "2NC" 2 = "2 NC 3s" 3 = "1 NO + 1 NC" 4 = "1 NO + 1 NC 3s" 5 = "2 OSSD" 6 = "1 NC"	RW	Real
		53	LimSpd Mon Delay Defines the Safe Limited Speed Monitoring Delay between the SLS_In ON to OFF transition and the initiation of the Safe Limited Speed (SLS) or Safe Maximum Speed (SMS) monitoring.	Units: Secs Default: 0 Min/Max: 0 / 6553.5	RW	Real
		54	Enable SW Input Configuration for the Enabling Switch input (ESM_In). "2NC" (1) – Dual-channel equivalent "2 NC 3s" (2) – Dual-channel equivalent 3 s "1 NO + 1 NC" (3) – Dual-channel complementary "1 NO + 1 NC 3s" (4) – Dual-channel complementary 3 s "2 OSSD" (5) – Dual-channel SS equivalent "1 NC" (6) – Single channel equivalent	Default: 0 = "Not used" Options: 0 = "Not used" 1 = "2NC" 2 = "2 NC 3s" 3 = "1 NO + 1 NC" 4 = "1 NO + 1 NC 3s" 5 = "2 OSSD" 6 = "1 NC"	RW	Real
		55	Safe Speed Limit Defines the speed limit that will be monitored in Safe Limited Speed (SLS) mode. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: RPM mm/s Default: 0 Min/Max: 0 / 6553.5 RPM 0 / 6553.5 mm/s	RW	Real
		56	Speed Hysteresis Provides hysteresis for SLS_Out output when Safe Limited Speed monitoring is active.	Units: % Default: 0 Min/Max: 0 / 100	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS	Door Control	57	Door Out Type Defines the lock and unlock state for door control output (DC_Out). When Door Out Type equals power to release, DC_Out is OFF in the lock state and ON in the unlock state. When Door Out Type equals power to lock, DC_Out is ON in the lock state and OFF in the unlock state. The first and middle units of a multi-axis system must be configured as cascading (2).	Default: 0 = "Pwr to Rel" Options: 0 = "Pwr to Rel" 1 = "Pwr to Lock" 2 = "2 Ch Sourcing"	RW	Real
		58	DM Input Configuration for the Door Monitor input (DM_In). "2NC" (1) – Dual-channel equivalent "2 NC 3s" (2) – Dual-channel equivalent 3 s "1 NO + 1 NC" (3) – Dual-channel complementary "1 NO + 1 NC 3s" (4) – Dual-channel complementary 3 s "2 OSSD" (5) – Dual-channel SS equivalent "1 NC" (6) – Single channel equivalent	Default: 0 = "Not used" Options: 0 = "Not used" 1 = "2NC" 2 = "2 NC 3s" 3 = "1 NO + 1 NC" 4 = "1 NO + 1 NC 3s" 5 = "2 OSSD" 6 = "1 NC"	RW	Real
		59	Lock Mon Enable Lock Monitoring can only be enabled when the speed monitoring safety option is a single unit or as the first unit in a multi-axis system (Cascaded Config equals 0 or 3).	Default: 0 = "Disable" Options: 0 = "Disable" 1 = "Enable"	RW	Real
		60	Lock Mon Input Configuration for the Lock Monitor input (LM_In). "2NC" (1) – Dual-channel equivalent "2 NC 3s" (2) – Dual-channel equivalent 3 s "1 NO + 1 NC" (3) – Dual-channel complementary "1 NO + 1 NC 3s" (4) – Dual-channel complementary 3 s "2 OSSD" (5) – Dual-channel SS equivalent "1 NC" (6) – Single channel equivalent	Default: 0 = "Not used" Options: 0 = "Not used" 1 = "2NC" 2 = "2 NC 3s" 3 = "1 NO + 1 NC" 4 = "1 NO + 1 NC 3s" 5 = "2 OSSD" 6 = "1 NC"	RW	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS	Max Speed	61	Max Speed Enable Enable Safe Maximum Speed Monitoring.	Default: 0 = "Disable" Options: 0 = "Disable" 1 = "Enable"	RW	Real
		62	Safe Max Speed Defines the maximum speed limit that will be tolerated if Safe Maximum Speed monitoring is enabled.	Units: RPM mm/s Default: 0 Min/Max: 0 / 65,535 RPM 0 / 65,535 mm/s	RW	Real
		63	Max Spd Stop Typ Defines the safe stop type that will be initiated in the event of a SMS Speed Fault. "Torque Off" (0) – Safe Torque Off With Standstill Checking "Safe Stp Typ" (1) – Safe Torque Off Without Standstill Checking	Default: 0 = "Torque Off" Options: 0 = "Torque Off" 1 = "Safe Stp Typ"	RW	Real
		64	Max Accel Enable Enable Safe Maximum Acceleration Monitoring.	Default: 0 = "Disable" Options: 0 = "Disable" 1 = "Enable"	RW	Real
		65	Safe Accel Limit Defines the Safe Maximum Acceleration Limit, relative to encoder 1, for which the system is being monitored. Units are based on rotary or linear configuration defined by P29 [Fbk 1 Units].	Units: Rev/s ² mm/s ² Default: 0 Min/Max: 0 / 65,535 rev/s ² 0 / 65,535 mm/s ²	RW	Real
		66	Max Acc Stop Typ Defines the safe stop type that will be initiated in the event of an Acceleration Fault. "Torque Off" (0) – Safe Torque Off With Standstill Checking "Safe Stp Typ" (1) – Safe Torque Off Without Standstill Checking	Default: 0 = "Torque Off" Options: 0 = "Torque Off" 1 = "Safe Stp Typ"	RW	Real

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																									
	Bit 0 "Z Channel Enbl" – Configures the Channel Z to be used and monitored for Phase Loss. A value of 0 = the Z channel will be ignored. Bit 1 "A Chan Only" – Configures the module to use only the A channel, and ignore the B channel. In this mode, direction cannot be determined, and the position counter will always count up. Bit 2 "Edge Mode" – Configure the module to use AB edge time data for speed calculation rather than accumulated count. Bit 3 "Inv Home In" – Configures the home input to be inverted. 1 = inverted, 0 = not inverted Bit 4 "Single Ended" – Configure when the A Quad B encoder has single ended signals. In this mode, Phase Loss detection is disabled. 0 = Differential, 1 = Single Ended Bit 5 "Direction" – Inverts the position count up/down associated with a given rotation direction internally. 1 = invert, 0 = do not invert																																																								
	2	Encoder PPR  Encoder Pulses Per Revolution Configures the encoder module for the Pulses Per Revolution (Encoder Lines) of the A Quad B Encoder.	Default: 1024 Min/Max: 2 / 20000	RW	Real																																																				
	3	Fdbk Loss Cfg  Feedback Loss Configure Configures how the drive reacts to an error status condition for the feedback.	Default: 3 = "FitCoastStop" Options: 0 = "Ignore" 1 = "Alarm" 2 = "Flt Minor" 3 = "FitCoastStop"	RW	Real																																																				
	4	Encoder Feedback Encoder Feedback Displays the position feedback value of the encoder. This should be used as a source for the main control (Port 0) Feedback Select.	Default: 0 Min/Max: -/+2147483647	RO	Real

Bit 0 "Safety Mode" – Indicates that the dip switch on the dual encoder module is configured to place its feedback signals on the SI backplane for use by the Safe Speed Monitor module. If multiple dual encoder modules are present, only one dual encoder can be configured for Safety Mode. 0 = Safety Mode Off. 1 = Safety Mode On. Bit 1 "SafetyVoltHi" – Indicates the status (configured by a jumper on the module) of the safety feedback voltage mode. 0 = 5V safety feedback mode, 1 = 12V safety feedback mode.

This bit is set if at least one of the bits "FB0 Error", "FB1 Error", or "System Error" is set.</p> <p>Bit 1 "Alarm Type 1" – Indicates that there is any alarm of type 1 active on the Feedback Option module. Bits 8...10 indicate what kind of alarm is active.</p> <p>Bit 2 "Alarm Type 2" – Indicates that there is any alarm of type 2 active on the Feedback Option module. Bits 20 and 21 indicate what kind of alarm is active.</p> <p>Bit 4 "FB0 Error" – Indicates that Feedback 0 has an error. This bit is set if any Feedback 0 error bit in P10 [FB0 Sts] is set. If this bit is set, the bit "Module Error" is also set.</p> <p>Bit 5 "FB1 Error" – Indicates that Feedback 1 has an error. This bit is set if any Feedback 1 error bit in P10 [FB1 Sts] is set. If this bit is set, the bit "Module Error" is also set.</p> <p>Bit 6 "System Error" – Indicates that there is a feedback independent error on the Feedback Option module. Bits 12 and 13 show the type of the System Error. If this bit is set, the bit "Module Error" is also set.</p> <p>Bit 8 "FB0 Alarm" – Indicates that Feedback 0 has an alarm This bit is set if there is an alarm in the Feedback 0 encoder. If this bit is set, the bit "Alarm Type 1" is also set.</p> <p>Bit 9 "FB1 Alarm" – Indicates that Feedback 1 has an alarm This bit is set if there is an alarm in the Feedback 1 encoder. If this bit is set, the bit "Alarm Type 1" is also set.</p> <p>Bit 10 "Cfg Alarm" – Indicates that there is a feedback independent alarm on the Feedback Option module. Bits 16 and 17 show the type of the Cfg Alarm. If this bit is set, Bit 1 "Alarm Type 1" is also set.</p> <p>Bit 12 "Hardware Err" – Indicates that there is a Hardware Error on the Feedback Option module. If this bit is set, Bit 6 "System Error" is also set.</p> <p>Bit 13 "Firmware Err" – Indicates that there is a Firmware Error on the Feedback Option module. A Firmware Error occurs if the Hardware and the downloaded Firmware are not compatible. If this bit is set, Bit 6 "System Error" is also set.</p> <p>Bit 16 "EncOut Cflct" – If set, there is one of the following problems with the Encoder Output:</p> <ul style="list-style-type: none"> The selection in P80 [Enc Out Sel] is not possible since the required pins on the terminal blocks are already used for Feedback 0 or 1 according to P6 [FB0 Device Sel] and P36 [FB1 Device Sel]. P80 [Enc Out Sel] is set to "Sine Cosine" and there is no signal connected to the pins 1-4 of the Terminal Block 1. P80 [Enc Out Sel] is set to "Sine Cosine", the value of [FBX IncAndSC PPR] is not a power of two, and the parameter P84 [Enc Out Z PPR] is not set to 0 "1 ZPulse". This is not allowed. P80 [Enc Out Sel] is set to "Channel X" or "Channel Y" and there is no encoder connected to that channel. P80 [Enc Out Sel] is set to "Channel X" or "Channel Y" and there is a linear encoder connected to this channel. If this bit is set, Bit 10 "Cfg Alarm" is also set. <p>Bit 17 "Safety Cflct" – If set, the Safety DIP switches are in an invalid position. If this bit is set, Bit 10 "Cfg Alarm" is also set.</p> <p>Bit 20 "FB0FB1 Cflct" – If set, the combination of the feedback selection done with the parameters P6 [FB0 Device Sel] and P36 [FB1 Device Sel] is invalid, i.e. both feedbacks have Sin-Cos-Signals (There is only place for one set of Sin-Cos-Signals on the Terminal Blocks). If this bit is set, Bit 2 "Alarm Type 2" is also set.</p> <p>Bit 21 "Initializing" – Indicates that the Universal Feedback State Machine is in the Initialize State. This Type 2 alarm makes sure that the motor cannot be started during the initialization state. If this bit is set, the bit "Alarm Type 2" is also set.</p> <p>Bit 29 "Pri Safety" – Indicates that the UFB is used as primary safety module.</p> <p>Bit 30 "Sec Safety" – Indicates that the UFB is used as secondary safety module.</p> <p>Bit 31 "DPI Ready" – This bit tells the MCB if the UFB is ready for DPI communication.</p>		DPI Ready	Sec Safety	Pri Safety	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Initializing	FB0FB1 Cflct	Reserved	Reserved	Safety Cflct	EncOut Cflct	Reserved	Reserved	Firmware Err	Hardware Err	Reserved	Cfg Alarm	FB1 Alarm	FB0 Alarm	Reserved	System Error	FB1 Error	FB0 Error	Reserved	Alarm Type 2	Alarm Type 1	Module Error	Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Default: 0 = "Fault" Options: 0 = "Fault" 1 = "Stop" 2 = "Zero Data" 3 = "Hold Last" 4 = "Send Flt Cfg"	RW	32-bit Integer																																																	
	56	755 Peer Flt Action Peer Fault Action Sets the action that the adapter and drive will take if the adapter detects that Peer I/O communications have been disrupted. This setting is effective only if I/O is transmitted through the adapter.	Default: 0 = "Fault" Options: 0 = "Fault" 1 = "Stop" 2 = "Zero Data" 3 = "Hold Last" 4 = "Send Flt Cfg"	RW	32-bit Integer																																																	

ATTENTION: Risk of injury or equipment damage exists. P54 [Comm Flt Action] lets you determine the action of the adapter and connected drive if I/O communications are disrupted. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable).

ATTENTION: Risk of injury or equipment damage exists. P55 [Idle Flt Action] lets you determine the action of the adapter and connected drive when the controller is idle. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a controller in idle state).

ATTENTION: Risk of injury or equipment damage exists. P56 [Peer Flt Action] lets you determine the action of the adapter and connected drive if the adapter is unable to communicate with the designated peer. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable).

		60 Thru 75	<p>755 Flt Cfg DL 01</p> <p>755 Flt Cfg DL 16 Fault Configure DeviceLogix</p> <p>Sets the data that is sent to the Datalink in the drive if any of the following is true:</p> <ul style="list-style-type: none"> • P54 [Comm Flt Action] is set to 4 "Send Flt Cfg" and I/O communications are disrupted. • P55 [Idle Flt Action] is set to 4 "Send Flt Cfg" and the controller is idle. • P56 [Peer Flt Action] is set to 4 "Send Flt Cfg" and Peer I/O communications are disrupted. • P57 [Msg Flt Action] is set to 4 "Send Flt Cfg" and explicit messaging for drive control is disrupted. 	<p>Default: 0</p> <p>Min/Max: 0 / 4294967295</p>	RW	Real	
		76	<p>755 DLs Fr Peer Cfg Datalinks From Peer Configure</p> <p>Sets the number of network-to-drive Datalinks (parameters) that are used for peer I/O. The Datalinks being used are allocated from the end of the list. For example, if this parameter's value is set to 3, Datalinks 14...16 are allocated for the three selected Datalinks. The Datalinks allocated for peer I/O cannot overlap with other assigned DL From Net 01...16 parameters.</p>	<p>Default: 0</p> <p>Min/Max: 0 / 16</p>	RW	Real	
77	<p>755 DLs Fr Peer Act Datalinks From Peer Action</p> <p>Displays the value of P76 [DLs Fr Peer Cfg] at the time the drive was reset. This is the number of actual peer-to-drive Datalinks that the drive is expecting.</p>	<p>Default: 0</p> <p>Min/Max: 0 / 16</p>	RO	Real			

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS		78	755 Logic Src Cfg Logic Source Configure Controls which of the peer-to-drive Datalinks contain the Logic Command for the drive.	Default: 0 Min/Max: 0 / 16	RW	Real
		79	755 Ref Src Cfg Reference Source Configure Controls which of the peer-to-drive Datalinks contain the Reference for the drive.	Default: 0 Min/Max: 0 / 16	RW	Real
		80	755 Fr Peer Timeout From Peer Timeout Sets the timeout for a Peer I/O connection. If the time is reached without the adapter receiving (consuming) a message, the adapter will respond with the action specified in P56 [Peer Flt Action]. In an adapter receiving (consuming) Peer I/O, the value of this parameter must be greater than the product of the value of P89 [To Peer Period] in the adapter transmitting (producing) Peer I/O multiplied by the value of P90 [To Peer Skip] in the adapter transmitting (producing) Peer I/O.	Units: Secs Default: 10.00 Min/Max: 0.01 / 10.00	RW	Real
		81 82 83 84	755 Fr Peer Addr 1 755 Fr Peer Addr 2 755 Fr Peer Addr 3 755 Fr Peer Addr 4 From Peer Address 1...4 Sets the bytes in the IP address that specifies the device from which the adapter receives (consumes) Peer I/O data. <div style="text-align: center;"> 255 . 255 . 255 . 255 [Peer Inp Addr 1] [Peer Inp Addr 2] [Peer Inp Addr 3] [Peer Inp Addr 4] </div> Important: The Peer Inp Addr must be on the same subnet as the embedded EtherNet/IP adapter. Changes to these parameters are ignored when P85 [Fr Peer Enable] is "1" (On).	Default: 0 Min/Max: 0 / 255	RW	Real
		85	755 Fr Peer Enable From Peer Enable Controls whether Peer I/O input is operating. A value of 0 "Off" turns off Peer I/O input. A value of 1 "Cmd/Ref" overrides the settings in Parameters P76 [DLs Fr Peer Cfg], P78 [Logic Src Cfg], and P79 [Ref Src Cfg] and automatically uses peer Datalink 01 as the drive's present Logic Command and peer Datalink 02 as the drive's Reference. A value of 2 "Custom" enables peer I/O input using the Datalink count and settings provided by the user.	Default: 0 = "Off" Options: 0 = "Off" 1 = "Cmd/Ref" 2 = "Custom"	RW	32-bit Integer
		86	755 Fr Peer Status From Peer Status Displays the status of the consumed Peer I/O input connection.	Default: 0 = "Off" Options: 0 = "Off" 1 = "Waiting" 2 = "Running" 3 = "Faulted"	RO	32-bit Integer
		87	755 DLs To Peer Cfg Datalinks To Peer Configure Sets the number of drive-to-network Datalinks (parameters) that are used for Peer I/O. The Datalinks being used are allocated from the end of the list. For example, if this parameter's value is set to 3, Datalinks 14...16 are allocated for the three selected Datalinks. The Datalinks allocated for this cannot overlap with other assigned DL To Net 01...16 parameters.	Default: 0 Min/Max: 0 / 16	RW	Real
		88	755 DLs To Peer Act Datalinks To Peer Action Displays the value of P87 [DLs To Peer Cfg] at the time the drive was reset. This is the number of actual drive-to-peer Datalinks that the drive is expecting.	Default: 0 Min/Max: 0 / 16	RO	Real

File	Group	No.	Name Description	Values	Read-Write	Data Type
HOST GROUPS		89	<p>755 To Peer Period To Peer Period Sets the minimum time that an adapter will wait when transmitting data to a peer. Important: Changes to this parameter are ignored when P91 [To Peer Enable] is 0 "Off."</p>	<p>Units: Secs Default: 10.00 Min/Max: 0.01 / 10.00</p>	RW	Real
		90	<p>755 To Peer Skip To Peer Skip Sets the maximum time that an adapter will wait when transmitting data to a peer. The value of P89 [To Peer Period] is multiplied by the value of this parameter to set the time. Important: Changes to this parameter are ignored when P91 [To Peer Enable] is 0 "Off."</p>	<p>Default: 1 Min/Max: 1 / 16</p>	RW	Real
		91	<p>755 To Peer Enable To Peer Enable Controls whether Peer I/O output is operating. A value of 0 "Off" turns off Peer I/O output. A value of 1 "Cmd/Ref" overrides the settings in Parameters P31 [DL To Net 15], P32 [DL To Net 16], P76 [DLs Fr Peer Cfg], and P77 [DLs Fr Peer Act], and automatically sends the drive's present Logic Command (as Datalink 01) and Reference (as Datalink 02). A value of 2 "Custom" enables Peer I/O output using the Datalink count and settings provided by the user.</p>	<p>Default: 0 = "Off" Options: 0 = "Off" 1 = "Cmd/Ref" 2 = "Custom"</p>	RW	32-bit Integer

Notes:

Troubleshooting

This chapter provides information to guide through troubleshooting PowerFlex 750-Series faults and alarms.

For information on...	See page
Faults, Alarms and Configurable Conditions	4-1
Drive Status Indicators	4-2
Manually Clearing Faults	4-3
Drive Fault and Alarm Descriptions	4-4
Common Symptoms and Corrective Actions	4-20

Faults, Alarms and Configurable Conditions

A fault is a condition that stops the drive. There are three types of faults.

Type	Description
Auto Reset Run	When this type of fault occurs, and P348 [Auto Rstrt Tries] is set to a value greater than "0," a user-configurable timer, P349 [Auto Rstrt Delay] begins. When the timer reaches zero, the drive attempts to automatically reset the fault. If the condition that caused the fault is no longer present, the fault will be reset and the drive will be restarted. "Auto Reset Run" faults are identified by "Y" in the "Auto Reset" column in Table 4.C on page 4-4 .
Resettable	This type of fault can be cleared. Resettable faults are identified by "Resettable Fault" in the "Type" column in Table 4.C .
Non-Resettable	This type of fault normally requires drive or motor repair. The cause of the fault must be corrected before the fault can be cleared. The fault will be reset on power up after repair. Non-Resettable faults are identified by "Non-Reset Fault" in the "Type" column in Table 4.C .

An alarm is a condition that, if left unaddressed, may stop the drive if running or prevent starting of the drive. There are two types of alarms.

Type	Description
Alarm 1	Alarms of type 1 indicate that a condition exists. Type 1 alarms are user configurable.
Alarm 2	Alarms of type 2 indicate that a configuration error exists and the drive cannot be started. Type 2 alarms are non-configurable.

User configurable conditions can be enabled as an alarm or fault.

Type	Description
Configurable	<p>Event action is enabled/disabled by the parameter identified in the "Configuration Parameter" column of Table 4.C.</p> <p>Options</p> <p>"Ignore" (0) – No action. "Alarm" (1) – Type 1 alarm indicated. "Fit Minor" (2) – Minor fault indicated. If running, drive continues to run. Enable with P950 [Minor Fit Config]. If not enabled, acts like a major fault. "FitCoastStop" (3) – Major fault indicated. Coast to Stop. "Fit RampStop" (4) – Major fault indicated. Ramp to Stop. "Fit CL Stop" (5) – Major fault indicated. Current Limit Stop.</p>

Drive Status Indicators

The condition or state of the drive is constantly monitored and is indicated through the LEDs and/or the HIM (if present).

Table 4.A PowerFlex 753 Drive Status Indicator Descriptions

Name	Color	State	Description
STS (Status)	Green	Flashing	Drive ready but not running, and no faults are present.
		Steady	Drive running, no faults are present.
	Yellow	Flashing	Drive is not running, a type 2 (non-configurable) alarm condition exists and the drive cannot be started.
		Steady	Drive is not running, a type 1 alarm condition exists. The drive can be started.
	Red	Flashing	A major fault has occurred. Drive will stop. Drive cannot be started until fault condition is cleared.
		Steady	A non-resettable fault has occurred.
	Red / Yellow	Flashing Alternately	A minor fault has occurred. When running, the drive continues to run. System is brought to a stop under system control. Fault must be cleared to continue. Use parameter 950 [Minor Fit Config] to enable. If not enabled, acts like a major fault.
	Yellow / Green	Flashing Alternately	When running, a type 1 alarm exists.
Green / Red	Flashing Alternately	Drive is flash updating.	

PowerFlex 753

Table 4.B PowerFlex 755 Drive Status Indicator Descriptions

Name	Color	State	Description
STS (Status)	Green	Flashing	Drive ready but not running, and no faults are present.
		Steady	Drive running, no faults are present.
	Yellow	Flashing	Drive is not running, a type 2 (non-configurable) alarm condition exists and the drive cannot be started.
		Steady	Drive is not running, a type 1 alarm condition exists. The drive can be started.
	Red	Flashing	A major fault has occurred. Drive will stop. Drive cannot be started until fault condition is cleared.
		Steady	A non-resettable fault has occurred.
	Red / Yellow	Flashing Alternately	A minor fault has occurred. When running, the drive continues to run. System is brought to a stop under system control. Fault must be cleared to continue. Use parameter 950 [Minor Fit Config] to enable. If not enabled, acts like a major fault.
	Yellow / Green	Flashing Alternately	When running, a type 1 alarm exists.
Green / Red	Flashing Alternately	Drive is flash updating.	
ENET	Unlit	Off	Adapter and/or network is not powered, adapter is not properly connected to the network, or adapter needs an IP address.
	Red	Flashing	An EtherNet/IP connection has timed out.
		Steady	Adapter failed the duplicate IP address detection test.
	Red / Green	Flashing Alternately	Adapter is performing a self-test.
	Green	Flashing	Adapter is properly connected but is not communicating with any devices on the network.
Steady		Adapter is properly connected and communicating on the network.	
LINK	Unlit	Off	Adapter is not powered or is not transmitting on the network.
	Green	Flashing	Adapter is properly connected and transmitting data packets on the network.
		Steady	Adapter is properly connected but is not transmitting on the network.

PowerFlex 755

Important: The Status Indicator LEDs on the HIM cradle do not indicate the current status of an installed Communication Adapter option. If an optional Communication Adapter is installed, refer to that option's user manual for a description of LED location and indication.

HIM Indication

Fault Display Screen

The pop-up Fault Display screen automatically appears when a fault condition for the Host Drive or any connected peripheral is detected. The pop-up Fault Display screen flashes to alert that a fault condition exists. This screen displays the:

- Fault Code number (See [Fault and Alarm Display Codes on page 4-4.](#))
- Fault description
- Elapsed time (in hh:mm:ss format) from fault detection

Figure 4.1 Pop-Up/Flashing Fault Display Screen

Soft Key Functions

Label	Name	Description
ESC	Escape	Reverts back to the previous screen without clearing the fault.
CLR	Clear	Removes the pop-up Fault Display screen from the display and clears the fault.

Single Function Key

Key	Name	Description
	Stop	Removes the pop-up Fault Display screen from the display and clears the fault.

Manually Clearing Faults

Step	Key(s)
<ol style="list-style-type: none"> 1. Press the “Clear” soft key to acknowledge the fault. The fault information will be removed so that you can use the HIM. 2. Address the condition that caused the fault. The cause must be corrected before the fault can be cleared. 3. After corrective action has been taken, clear the fault by one of these methods: <ul style="list-style-type: none"> • Press Stop (if running the drive will stop) • Cycle drive power • Select the “Clear” soft key on the HIM Diagnostic folder Faults menu. 	 

Fault and Alarm Display Codes

Event numbers for PowerFlex 750-Series faults and alarms are displayed in one of three formats.

- Port 00 (Host Drive) displays the event number only. For example, Fault 3 “Power Loss” is displayed as:
Fault Code 3.
- Ports 01 through 09 use the format PEEE, indicating port number (P) and event number (EEE). For example, Fault 1 “Analog In Loss” on an I/O module installed in Port 4 is displayed as:
Fault Code 4001.
- Ports 10 through 14 use the format PPEEE, indicating port number (PP) and event number (EEE). For example, Fault 37 “Net IO Timeout” on Port 14 is displayed as:
Fault Code 14037.

Drive Fault and Alarm Descriptions

The table below contains a list of drive-specific faults and alarms, the type of fault or alarm, the action taken when the drive faults, the parameter used to configure the fault or alarm (if applicable), and a description and action (where applicable).

Table 4.C Drive Fault and Alarm Types, Descriptions and Actions

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
0	No Entry					
2	Auxiliary Input	Resettable Fault	Coast			An auxiliary input interlock is open.
3	Power Loss	Configurable		P449 [Power Loss Actn]	Y	The DC bus voltage remained below the P451/P454 [Pwr Loss X Level] of nominal for longer than the time programmed in P452/P455 [Pwr Loss X Time].
4	UnderVoltage	Configurable		P460 [UnderVltg Action]	Y	If the bus voltage, P11 [DC Bus Volts] falls below the value set in P461 [UnderVltg Level] an undervoltage condition exists.
5	OverVoltage	Resettable Fault	Coast		Y	The DC bus voltage exceeded the maximum value.
7	Motor Overload	Configurable		P410 [Motor OL Actn]	Y	An internal electronic overload trip has occurred.
8	Heatsink OvrTemp	Resettable Fault	Coast		Y	The heatsink temperature has exceeded 100% of the drive temperature.
9	Trnsistr OvrTemp	Resettable Fault	Coast		Y	The output transistors have exceeded the maximum operating temperature.
10	DynBrake OvrTemp	Alarm 1				The dynamic brake resistor has exceeded its maximum operating temperature.
12	HW OverCurrent	Resettable Fault	Coast		Y	The drive output current has exceeded the hardware current limit.
13	Ground Fault	Resettable Fault	Coast		Y	A current path to earth ground greater than 25% of drive rating has occurred.
14	Ground Warning	Configurable				The ground current has exceeded the level set in P467 [Ground Warn Lvl].
15	Load Loss	Configurable		P441 [Load Loss Action]		The output torque current is below the value programmed in P442 [Load Loss Level] for a time period greater than the time programmed in P443 [Load Loss Time].
17	Input Phase Loss	Configurable		P462 [InPhase LossActn]		The DC bus ripple has exceeded a preset level.

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
18	Motor PTC Trip	Configurable		P250 [PTC Config]		Motor PTC (Positive Temperature Coefficient) over temperature.
20	TorqPrv Spd Band	Resettable Fault	Coast			The difference between P2 [Commanded SpdRef] and P3 [Mtr Vel Fdbk] has exceeded the level programmed in P1105 [Speed Dev Band] for a time period greater than the time programmed in P1106 [SpdBand Intgrtr].
21	Output PhaseLoss	Configurable		P444 [OutPhaseLossActn]		The current in one or more phases has been lost or remains below a preset level.
24	Decel Inhibit	Configurable		P409 [Dec Inhibit Actn]		The drive is not following a commanded deceleration because it is attempting to limit the bus voltage.
25	OverSpeed Limit	Resettable Fault	Coast		Y	The motor operating speed exceeds the limit set by the maximum speed setting P524 [Overspeed Limit]. For forward motor rotation, this limit is P520 [Max Fwd Speed] + P524 [Overspeed Limit]. For reverse motor rotation, this limit is P521 [Max Rev Speed] - P524 [Overspeed Limit]. When flux vector control modes are selected in P35 [Motor Ctrl Mode] the motor operating speed is determined by P131 [Active Vel Fdbk]. For all other non-flux vector control modes, the motor operating speed is determined by P1 [Output Frequency].
26	Brake Slipped	Alarm 1				The encoder movement has exceeded the level in P1110 [Brk Slip Count] after the brake was set and the brake slip maneuver is controlling the drive. (Drive is active.)
		Alarm 2				The encoder movement has exceeded the level in P1110 [Brk Slip Count] after the brake was set and the brake slip maneuver is finished. (Drive is stopped.)
27	Torq Prove Cflct	Alarm 2				When P1100 [Trq Prove Cfg] is enabled, P35 [Motor Ctrl Mode], P125 [Pri Vel Fdbk Sel] and P135 [Mtr Psn Fdbk Sel] must be properly set. If these parameters point to a feedback module, the module parameters must also be properly set.
28	TrqProv EnclsCfg	Alarm 2				Encoderless TorqProve has been enabled but user has not read and understood application concerns of encoderless operation. Read the "Attention" on page C-4 relating to the use of TorqProve with no encoder.
29	Analog In Loss	Configurable		263 [Anlg In0 LssActn]		Analog input has a lost signal.
33	AuRsts Exhausted	Resettable Fault	Coast			The drive unsuccessfully attempted to reset a fault and resume running for the programmed number of tries.
36	SW OverCurrent	Resettable Fault	Coast		Y	The drive output current has exceeded the 1 ms current rating. This rating is greater than the 3 second current rating and less than the hardware overcurrent fault level. It is typically 200...250% of the drive continuous rating.
38	Phase U to Gnd	Resettable Fault	Coast			A phase to ground fault has been detected between the drive and motor in this phase.
39	Phase V to Gnd					
40	Phase W to Gnd					
41	Phase UV Short	Resettable Fault	Coast			Excessive current has been detected between these two output terminals.
42	Phase VW Short					
43	Phase WU Short					
44	Phase UNot ToGnd	Resettable Fault	Coast			A phase to ground fault has been detected between the drive and motor in this phase.
45	Phase VNot ToGnd					
46	Phase WNot ToGnd					
48	Params Defaulted	Resettable Fault	Coast			The drive was commanded to write default values.
49	Drive Powerup	–				A Power Up Marker in the Fault Queue indicating that the drive power cycled.
51	Clr Fault Queue	–				Indication that the fault queue has been cleared.
55	Crtl Bd Overtemp	Resettable Fault	Coast			The temperature sensor on the main control board detected excessive heat. See product temperature requirement.

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
58	Module Defaulted	Resettable Fault	Coast			The module was commanded to write default values.
59	Invalid Code	Resettable Fault	Coast			Internal error.
61	Shear Pin 1	Configurable		P435 [Shear Pin 1 Actn]	Y	The programmed value in P436 [Shear Pin1 Level] has been exceeded.
62	Shear Pin 2	Configurable		P438 [Shear Pin 2 Actn]	Y	The programmed value in P439 [Shear Pin2 Level] has been exceeded.
64	Drive OverLoad	Alarm 1			Y	P940 [Drive OL Count] has exceeded 50% but is less than 100%.
		Resettable Fault	Coast			P940 [Drive OL Count] has exceeded 100%. Reduce the mechanical load on the drive.
67	Pump Off	Alarm 1				Pump Off condition has been detected.
71	Port 1 Adapter	Resettable Fault	Coast			The DPI communications option has a fault. See device event queue.
72	Port 2 Adapter					
73	Port 3 Adapter					
74	Port 4 Adapter					
75	Port 5 Adapter					
76	Port 6 Adapter					
77	IR Volts Range	Alarm 2				The default for P70 [Autotune] is 1 "Calculate" and the value calculated from the motor nameplate values returned a value for P73 [IR Voltage Drop] which is not in the range of acceptable values.
		Resettable Fault	Coast			P70 [Autotune] is set to 2 "Static Tune" or 3 "Rotate Tune" and the value measured by the Autotune procedure for P73 [IR Voltage Drop] is not in the range of acceptable values.
78	FluxAmpsRef Rang	Alarm 2				The default for P70 [Autotune] is 1 "Calculate" and the value for flux amps determined by the Autotune procedure exceeds the value programmed in P26 [Motor NP Amps].
		Resettable Fault	Coast			P70 [Autotune] is set to 2 "Static Tune" or 3 "Rotate Tune" and the value for flux amps measured by the Autotune procedure exceeds the value programmed in P26 [Motor NP Amps].
79	Excessive Load	Resettable Fault	Coast			The motor did not come up to speed in the allotted time during Autotune.
80	AutoTune Aborted	Resettable Fault	Coast			The Autotune function was manually canceled or a fault occurred.
81	Port 1 DPI Loss	Resettable Fault	Coast			The DPI port stopped communicating. Check connections and drive grounding.
82	Port 2 DPI Loss					
83	Port 3 DPI Loss					
84	Port 4 DPI Loss					
85	Port 5 DPI Loss					
86	Port 6 DPI Loss					
87	IXo VoltageRange	Alarm 2				The default for P70 [Autotune] is 1 "Calculate" and the voltage calculated for motor inductive impedance exceeds 25% of the value of P25 [Motor NP Volts].
		Resettable Fault	Coast			P70 [Autotune] is set to 2 "Static Tune" or 3 "Rotate Tune" and the voltage measured for motor inductive impedance exceeds 25% of the value of P25 [Motor NP Volts].
91	Pri VelFdbk Loss	Configurable		Note: See option module for config parameter number		A Feedback Loss has been detected for the source of P134 [Aux Vel Feedback]. This could be due to a problem detected by the feedback option module selected by P125 [Pri Vel Fdbk Sel] or due to a loss in communication between the feedback option module and main control board. The source of primary velocity feedback must be configured not to fault if the feedback loss switchover feature is used.
93	Hw Enable Check	Resettable Fault	Coast			Hardware enable is disabled (jumper installed) but indicates not enabled.

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
94	Alt VelFdbk Loss	Configurable		Note: See option module for config parameter number		A Feedback Loss has been detected for the source of P128 [Alt Vel Fdbk Sel]. This could be due to a problem detected by the feedback option module selected by P128 [Alt Vel Fdbk Sel] or due to a loss in communication between the feedback option module and main control board.
95	Aux VelFdbk Loss	Configurable				A Feedback Loss has been detected for the source of P132 [Aux Vel Fdbk Sel]. This could be due to a problem detected by the feedback option module selected by P132 [Aux Vel Fdbk Sel] or due to a loss in communication between the feedback option module and main control board.
96	PositionFdbkLoss	Configurable				A Feedback Loss has been detected for the source of P847 [Psn Fdbk]. This could be due to a problem detected by the feedback option module selected by P135 [Mtr Psn Fdbk Sel] or due to a loss in communication between the feedback option module and main control board.
97	Auto Tach Switch	Resettable Fault	Coast			Indication that either of the two following conditions exists. <ul style="list-style-type: none"> Tach switch has occurred and alternate feedback device has failed. Tach switch has not occurred, Auto Tach Switch Option is enabled and both primary and alternate devices have failed.
100	Parameter Chksum	Resettable Fault	Coast			The checksum read from the non-volatile storage does not match the checksum calculated. Data set to default value.
104	Pwr Brd Checksum	Non-Reset Fault				The checksum read from the non-volatile storage does not match the checksum calculated. Data set to default value.
106	Incompat MCB-PB	Non-Reset Fault	Coast			The main control board did not recognize the power structure. Flash with newer Application version.
107	Replaced MCB-PB	Resettable Fault	Coast			The main control board was moved to a different power structure. Data set to default values.
108	Anlg Cal Chksum	Non-Reset Fault	Coast			The checksum read from the analog calibration data does not match the checksum calculated. Replace main control board.
111	PwrBd Invalid ID	Non-Reset Fault	Coast			Power structure ID invalid. Flash with newer Application version.
112	PwrBd App MinVer	Resettable Fault	Coast			Power structure needs newer Application version. Flash with newer Application version.
113	Tracking DataErr	Resettable Fault	Coast			Internal data error.
115	PwrDn Table Full	Resettable Fault	Coast			Internal data error.
116	PwrDnEntry2Large	Resettable Fault	Coast			Internal data error.
117	PwrDn Data Chksm	Resettable Fault	Coast			Internal data error.
118	PwrBd PwrDn Chks	Resettable Fault	Coast			Internal data error.
124	App ID Changed	Resettable Fault	Coast			Application Firmware changed. Verify Application version.
125	Using Backup App	Resettable Fault	Coast			Application did not flash correctly. Reflash.
134	Start On PowerUp	Alarm 1				When P345 [Start At PowerUp] is enabled, an alarm will be set for the time programmed in P346 [PowerUp Delay].
137	Ext Prechrg Err	Configurable		P323 [Prchrg Err Cfg]		The seal contact on the external precharge contactor has opened (as signalled by P190 [DI Prchrg Seal]) while the drive was running (PWM was active).
138	Precharge Open	Resettable Fault	Coast			The internal precharge was commanded to open while the drive was running (PWM was active). The internal fault latch will be automatically cleared when PWM is disabled.
141	Autn Enc Angle	Resettable Fault	Coast			P78 [EncdrLss AngComp] is out of range.

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
142	Autn Spd Rstrct	Resettable Fault	Coast			Frequency limit settings are preventing the drive from reaching a suitable speed during an Inertia Tune test.
143	Autotune CurReg	Resettable Fault	Coast			Calculated values for P96 [VCL Cur Reg Kp] and/or P97 [VCL Cur Reg Ki] are out of range.
144	Autotune Inertia	Resettable Fault	Coast			Results from the Inertia Tune test out of range for P76 [Total Inertia].
145	Autotune Travel	Resettable Fault	Coast			When P77 [Inertia Test Lmt] is set, the Inertia Tune test was prevented from reaching a suitable speed to run the test.
152	No Stop Source	Resettable Fault	Coast			Last stop source has been removed.
155	Bipolar Conflict	Alarm 2				P308 [Direction Mode] is set to 1 "Bipolar" or 2 "Rev Disable" and one or more digital input is enabled for direction control.
157	DigIn Cfg B	Alarm 2				Digital input conflict. Correct Digital Input configuration.
158	DigIn Cfg C	Alarm 2				Digital input conflict. Correct Digital Input configuration.
161	Sleep Cfg	Alarm 2				There is a Sleep/Wake configuration error. With Sleep Wake Mode = Direct, possible causes include: Drive is stopped and Wake Level < Sleep Level. Stop=CF, Run, Run Fwd, or Run Rev is not configured in Digital Input functions.
162	Waking	Alarm 2				The Wake timer is counting toward a value that will start the drive.
168	HeatSinkUnderTmp	Resettable Fault				Heatsink temperature sensor is reporting a value below -18.7 °C (-1.66 °F) or the sensor feedback circuit is open.
169	PWM Freq Reduced	Alarm 1				The PWM Frequency has been reduced from the value set in P38 [PWM Frequency] due to excessive IGBT junction temperatures.
170	CurLimit Reduced	Alarm 1				The current limit value has been reduced from the value set in P422/423 [Current Limit X] due to excessive IGBT junction temperatures or P940 [Drive OL Count] = 95%.
171	Adj Vltg Ref	Alarm 1				Invalid adjustable voltage reference selection conflict.
177	Profiling Active	Alarm 1				The Profile/Indexer is active.
178	Homing Active	Alarm 1				The Homing function is active.
179	Home Not Set	Alarm 1				The Home position was not set before profile operation.
185	Freq Conflict	Alarm 2				Indicates that the values of P520 [Max Fwd Speed] and P521 [Max Rev Speed] are in conflict with the value of P63 [Break Frequency].
186	VHz Neg Slope	Alarm 2				Indicates that the V/Hz curve segment resulted in a negative V/Hz slope.
187	VHz Boost Limit	Alarm 2				Indication that one of the two following conditions exists. <ul style="list-style-type: none"> • P60 [Start/Acc Boost] and P61 [Run Boost] are greater than P25 [Motor NP Volts] x 0.25 when P65 [VHz Curve] = 0 "Custom V/Hz." • P61 [Run Boost] is greater than P25 [Motor NP Volts] x 0.25 when P65 [VHz Curve] = 1 "Fan/Pump."
190	PM FV Pri Fdbk	Alarm 2				Indicates a control mode and primary feedback device configuration error. P35 [Motor Ctrl Mode] is set to a flux vector "FV" control mode, P125 [Pri Vel Fdbk Sel] is set to 137 (port 0, P137 [Open Loop Fdbk]).
191	PM FV Alt Fdbk	Alarm 2				Indicates a control mode and alternate feedback device configuration error. P35 [Motor Ctrl Mode] is set to a flux vector "FV" control mode, P635 [Spd Options Ctrl] is set to bit 7 "Auto Tach SW," P125 [Pri Vel Fdbk Sel] is set to 137 (port 0, P137 [Open Loop Fdbk]).
192	Fwd Spd Lim Cfg	Alarm 2				The forward speed reference is out of range. Verify the settings of P38 [PWM Frequency] and P520 [Max Fwd Speed]. Lower carrier frequencies reduce the output frequency range. Verify that P522 [Min Fwd Speed] is less than P520 [Max Fwd Speed].

Event No.	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
193	Rev Spd Lim Cfg	Alarm 2				The reverse speed reference is out of range. Verify the settings of P38 [PWM Frequency] and P521 [Max Rev Speed]. Lower carrier frequencies reduce the output frequency range. Verify that P523 [Min Rev Speed] is less than P521 [Max Rev Speed].
203	Port 13 Adapter	Resettable Fault	Coast			The embedded EtherNet/IP adapter has a fault. See EtherNet event queue.
204	Port 14 Adapter	Resettable Fault	Coast			The DeviceLogix adapter has a fault.
205	DPI TransportErr	Alarm 1				A DPI Communication Error has occurred.
210	HW En Jumper Out	Resettable Fault	Coast			A Safety Option module is present and Jumper J1 ENABLE is removed. Install the jumper.
211	Safety Brd Fault	Resettable Fault	Coast			A Safety option module has indicated a fault. Verify that Jumper J1 ENABLE is installed. Reset or power cycle drive.
212	Safety JumperOut	Resettable Fault	Coast			Jumper J2 SAFETY is not installed and a Safety option module is not present. Install the jumper.
213	Safety Jumper In	Resettable Fault	Coast			Jumper J2 SAFETY is installed and a Safety option module is present. Remove the jumper.
214	SafetyPortCnflct	Alarm 2				Allowable number of safety options exceeded.
224	Port 4 Comm Loss	Resettable Fault	Coast			The device at the port has stopped communicating with the main control board. Verify that the device is present and functional. Verify network connections. Verify options installed in ports 4...8 are seated in the port and secured with mounting screws.
225	Port 5 Comm Loss					
226	Port 6 Comm Loss					
227	Port 7 Comm Loss					
228	Port 8 Comm Loss					
229	Port 9 Comm Loss					
230	Port10 Comm Loss					
231	Port11 Comm Loss					
232	Port12 Comm Loss					
233	Port13 Comm Loss					
234	Port14 Comm Loss					
244	Port 4 Cfg	Alarm 2				The main control board does not have the correct option in the port. Option may not be compatible with product or MCB firmware needs to be updated to support it. Option may have to be moved or removed, accept option configuration change.
245	Port 5 Cfg					
246	Port 6 Cfg					
247	Port 7 Cfg					
248	Port 8 Cfg					
249	Port 9 Cfg					
250	Port 10 Cfg					
251	Port 11 Cfg					
252	Port 12 Cfg					
253	Port 13 Cfg

313	ENet Checksum	Resetable Fault	Coast			Ethernet/IP storage checksum failed. Data set to default values.
314	DLX Checksum	Resetable Fault	Coast			DeviceLogix storage checksum failed. Data set to default values.
14037	Net IO Timeout	Configurable		P52 [DLX Prog Cond]		DeviceLogix has been disabled.

Important: Fault and Alarm event numbers between 3000 and 13999 are generated by a module installed in a port. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation. For event numbers that fall between 13000 and 13999, refer to the PowerFlex 755 Drive Embedded EtherNet/IP Adapter User Manual, publication 750COM-UM001 for descriptions.

I/O Faults and Alarms

The table below contains a list of I/O-specific faults and alarms, the type of fault or alarm, the action taken when the drive faults, the parameter used to configure the fault or alarm (if applicable), and a description and action (where applicable).

Table 4.E I/O Fault and Alarm Types, Descriptions and Actions

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
xx000	No Entry					
xx001	Analog In Loss	Configurable		P53/P63 [Anlg InX LssActn]		Analog input has a lost signal.
xx002	Motor PTC Trip	Configurable		P40 [PTC Cfg]		Motor PTC (Positive Temperature Coefficient) over temperature.
xx005	Relay0 Life	Configurable		P106 [RO0 LifeEvtActn]		Predictive maintenance.
xx006	Relay1 Life	Configurable		P116 [RO1 LifeEvtActn]		Predictive maintenance.
xx010	Anlg Cal Chksum	Non-Reset Fault	Coast			The checksum read from the analog calibration data does not match the checksum calculated. Replace option module.
xx058	Module Defaulted	Fault	Coast			Module was commanded to write default values.

(1) xx indicates the port number. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation.

Safe Torque Off Fault

The table below lists the safe torque off-specific fault, the action taken when the drive faults, and its description.

Table 4.F Safe Torque Fault and Alarm Types, Descriptions and Actions

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
xx000	No Entry					
xx058	Module Defaulted	Fault	Coast			Module was commanded to write default values.

(1) xx indicates the port number. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation.

Single Incremental Encoder Faults and Alarms

The table below contains a list of encoder-specific faults and alarms, the type of fault or alarm, the action taken when the drive faults, the parameter used to configure the fault or alarm (if applicable), and a description and action (where applicable).

Table 4.G Single Incremental Encoder Fault and Alarm Types, Descriptions and Actions

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
xx000	Open Wire	Configurable		P3 [Fdbk Loss Cfg]		The encoder module has detected an input signal (A, B, or Z) in the same state as its complement (A Not, B Not, or Z Not). For open wire detection to work, the encoder signals must be differential (not single ended). The Z channel is only checked when enabled. See P1 [Encoder Cfg].
xx001	Phase Loss	Configurable		P3 [Fdbk Loss Cfg]		More than 30 phase loss (open wire) events have occurred over an 8 millisecond time period. The same restrictions as for Open Wire detection apply.
xx002	Quadrature Loss	Configurable		P3 [Fdbk Loss Cfg]		Quadrature loss events occur when simultaneous edge transitions occur on both the A and B encoder channels. This fault will occur when more than 10 quad loss events over a 10 millisecond time period are detected. Only valid when both A and B channels are used (not Bit 1 "A Chan Only") in P1 [Encoder Cfg].
xx058	Module Defaulted	Fault	Coast			Module was commanded to write default values.

(1) xx indicates the port number. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation.

Dual Incremental Encoder Faults and Alarms

The table below contains a list of encoder-specific faults and alarms, the type of fault or alarm, the action taken when the drive faults, the parameter used to configure the fault or alarm (if applicable), and a description and action (where applicable).

Table 4.H Dual Incremental Encoder Fault and Alarm Types, Descriptions and Actions

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Parameter	Auto Reset	Description/Action(s)
xx000	Enc0 Open Wire	Configurable		P3 [Enc 0 FB Lss Cfg]		The dual encoder module has detected an encoder 0 input signal (A, B, or Z) in the same state as its complement (A Not, B Not, or Z Not). For open wire detection to work, the encoder signals must be differential (not single ended). The Z channel is only checked when enabled. See P1 [Enc 0 Cfg].
xx001	Enc0 Phase Loss	Configurable		P3 [Enc 0 FB Lss Cfg]		More than 30 encoder 0 phase loss (open wire) events have occurred over an 8 millisecond time period. The same restrictions as for Enc0 Open Wire detection apply.
xx002	Enc0 Quad Loss	Configurable		P3 [Enc 0 FB Lss Cfg]		Encoder 0 Quadrature loss events occur when simultaneous edge transitions occur on both the A and B channels of encoder 0. This fault will occur when more than 10 quad loss events over a 10 millisecond time period are detected. Only valid when both A and B channels are used (not Bit 1 "A Chan Only") in P1 [Enc 0 Cfg].
xx030	Enc1 Open Wire	Configurable		P13 [Enc 1 FB Lss Cfg]		The dual encoder module has detected an encoder 1 input signal (A, B, or Z) in the same state as its complement (A Not, B Not, or Z Not). For open wire detection to work, the encoder signals must be differential (not single ended). The Z channel is only checked when enabled. See P11 [Enc 1 Cfg].
xx031	Enc1 Phase Loss	Configurable		P13 [Enc 1 FB Lss Cfg]		More than 30 encoder 1 phase loss (open wire) events have occurred over an 8 millisecond time period. The same restrictions as for Enc1 Open Wire detection apply.
xx032	Enc1 Quad Loss	Configurable		P13 [Enc 1 FB Lss Cfg]		Encoder 1 Quadrature loss events occur when simultaneous edge transitions occur on both the A and B channels of encoder 1. This fault will occur when more than 10 quad loss events over a 10 millisecond time period are detected. Only valid when both A and B channels are used (not Bit 1 "A Chan Only") in P11 [Enc 1 Cfg].
xx058	Module Defaulted	Fault	Coast			Module was commanded to write default values.

(1) xx indicates the port number. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation.

Universal Feedback Faults and Alarms

The table below contains a list of universal feedback-specific faults and alarms, the type of fault or alarm, the action taken when the drive faults, the parameter used to configure the fault or alarm (if applicable), and a description and action (where applicable).

Table 4.I Universal Feedback Fault and Alarm Types, Descriptions and Actions

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx000	LightSrc Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Light source failure
xx001	Ch0 SigAmp Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface -Signal amplitude error
xx002	Ch0 PsnVal Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Position value error
xx003	Ch0 OverVolt Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Overvoltage error
xx004	Ch0 UndVolt Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Undervoltage error
xx005	Ch0 OverCur Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Overcurrent error
xx006	Ch0 Battery Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Battery empty
xx009	Ch0 AnalSig Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Analog signals outside specification
xx010	Ch0 IntOfst Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Faulty internal angular offset
xx011	Ch0 DataTabl Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Data field partitioning table damaged
xx012	Ch0 Anallim Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Analog limit values not available
xx013	Ch0 Int I2C Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Internal I2C bus not operational
xx014	Ch0 IntChksm Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Internal checksum error
xx015	Ch0 PrgmResetErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Encoder reset occurred as a result of program monitoring
xx016	Ch0 CntOvrflwErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Counter overflow
xx017	Ch0 Parity Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Parity error
xx018	Ch0 Chksum Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Checksum of the data transmitted is incorrect
xx019	Ch0 InvCmd Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Unknown command code
xx020	Ch0 SendSize Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Number of data transmitted is incorrect
xx021	Ch0 CmdArgmt Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Command argument transmitted is not allowed
xx022	Ch0 InvWrtAdrErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - The selected data field must not be written to (invalid write address)
xx023	Ch0 AccCode Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Incorrect access code
xx024	Ch0 FieldSizeErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Size of data field stated cannot be changed

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx025	Ch0 Address Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Word address stated is outside data field
xx026	Ch0 FieldAcc Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Access to non-existent data field
xx028	Ch0 SiTurnPsnErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Single turn position unreliable
xx029	Ch0 MulTrnPsnErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Multiple turn position unreliable
xx036	Ch0 AnalVal Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Analog value error (process data)
xx037	Ch0 SendCurr Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Transmitter current critical (dirt, broken transmitter)
xx038	Ch0 EncTemp Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Encoder temperature critical
xx039	Ch0 Speed Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by Stegmann Encoder on Channel 0 with Hiperface Interface - Speed too high, no position formation possible
xx040	Ch0 General Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - An error bit of the BiSS Single Cycle Data is set
xx046	Ch0 LED Curr Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - LED current out of control range
xx047	Ch0 ExMulTurnErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - External multi-turn error
xx048	Ch0 PsnCode Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - Position code error (single step error)
xx049	Ch0 Config Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - failure configuring interface
xx050	Ch0 PsnVal Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - Position data not valid
xx051	Ch0 SerialComErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - Serial interface failure
xx052	Ch0 Ext Failure	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - External failure over NERR
xx053	Ch0 Temp Exc Err	Configurable		P9 [FB0 Loss Cfg]		Error reported by a Encoder on Channel 0 with BiSS Interface - Temperature out of defined range
xx058	Module Defaulted	Fault	Coast			Parameter values for this encoder have been reset to their default settings.
xx064	Ch0 OutOfRailErr	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Rail is no longer present between the read head
xx068	Ch0 Read Head 1	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates that the read head must be cleaned or installed correctly
xx069	Ch0 Read Head 2	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates that the read head must be cleaned or installed correctly
xx070	Ch0 RAM Error	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates a RAM error. Reading head needs to be repaired
xx071	Ch0 EPROM Error	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates a EPROM error. Reading head needs to be repaired
xx072	Ch0 ROM Error	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates a ROM error. Reading head needs to be repaired
xx074	Ch0 No Position	Configurable		P9 [FB0 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 0 - Indicates that no position value was available - only possible following powerup or reset

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx081	Ch0 Msg Cheksum	Configurable		P9 [FB0 Loss Cfg]		Indicates the option card has detected a serial communications checksum error while attempting to communicate with the encoder on channel 0.
xx082	Ch0 Timeout	Configurable		P9 [FB0 Loss Cfg]		Indicates the option card has detected a serial communications timeout error while attempting to communicate with the encoder on channel 0.
xx083	Ch0 Comm	Configurable		P9 [FB0 Loss Cfg]		Indicates the option card has detected a serial communications error (other than checksum or timeout) while attempting to communicate with the encoder on channel 0.
xx084	Ch0 Diagnostic	Configurable		P9 [FB0 Loss Cfg]		Indicates the option card has detected a powerup diagnostic test failure for encoder channel 0.
xx085	Ch0 SpplyVltgRng	Configurable		P9 [FB0 Loss Cfg]		Indicates that the voltage source to the encoder 0 is out of range.
xx086	Ch0 SC Amplitude	Configurable		P9 [FB0 Loss Cfg]		Indicates that the encoder 0 signal amplitude is out of tolerance.
xx087	Ch0 Open Wire	Configurable		P9 [FB0 Loss Cfg]		Indicates that an open wire condition has been detected for encoder 0.
xx088	Ch0 Quad Loss	Configurable		P9 [FB0 Loss Cfg]		Indicates that a signal quadrature error has been detected for encoder 0
xx089	Ch0 Phase Loss	Configurable		P9 [FB0 Loss Cfg]		Indicates that an A or B signal of an A quad B incremental encoder on Channel 0 is disconnected.
xx090	Ch0 Unsupp Enc	Configurable		P9 [FB0 Loss Cfg]		Indicates that the connected encoder on Channel 0 is not supported
xx100	Ch0 FreqExc Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Frequency exceeded warning
xx101	Ch0 TempExc Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Temperature exceeded warning
xx102	Ch0 LightLim Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Limit of light control reserve reached
xx103	Ch0 Battery Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Battery warning
xx104	Ch0 RefPoint Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 0 with EnDat Interface - Reference point not reached
xx108	Ch0 General Alm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by a Encoder on Channel 0 with BiSS Interface - A warning bit of the BiSS Single Cycle Data is set
xx115	Ch0 Optics Alarm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by a linear Stahl encoder on Channel 0 - Displays an alarm when the Stahl optical system requires cleaning
xx116	Ch0 OutOfRailAlm	Alarm 1		P9 [FB0 Loss Cfg]		Alarm reported by a linear Stahl encoder on Channel 0 - Indicates that the read encoder count is at the maximum value (524287)
xx200	Ch1 LightSrc Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Light source failure
xx201	Ch1 SigAmp Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface -Signal amplitude error
xx202	Ch1 PsnVal Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Position value error
xx203	Ch1 OverVolt Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Overvoltage error
xx204	Ch1 UndVolt Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Undervoltage error
xx205	Ch1 OverCur Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Overcurrent error
xx206	Ch1 Battery Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Battery empty
xx209	Ch1 AnalSig Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Analog signals outside specification

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx210	Ch1 IntOfst Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Faulty internal angular offset
xx211	Ch1 DataTabl Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Data field partitioning table damaged
xx212	Ch1 AnalLim Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Analog limit values not available
xx213	Ch1 Int I2C Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Internal I2C bus not operational
xx214	Ch1 IntChksum Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Internal checksum error
xx215	Ch1 PrgmResetErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Encoder reset occurred as a result of program monitoring
xx216	Ch1 CntOvflwErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Counter overflow
xx217	Ch1 Parity Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Parity error
xx218	Ch1 Chksum Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Checksum of the data transmitted is incorrect
xx219	Ch1 InvCmd Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Unknown command code
xx220	Ch1 SendSize Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Number of data transmitted is incorrect
xx221	Ch1 CmdArgmt Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Command argument transmitted is not allowed
xx222	Ch1 InvWrtAdrErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - The selected data field must not be written to (invalid write address)
xx223	Ch1 AccCode Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Incorrect access code
xx224	Ch1 FieldSizeErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Size of data field stated cannot be changed
xx225	Ch1 Address Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Word address stated is outside data field
xx226	Ch1 FieldAcc Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Access to non-existent data field
xx228	Ch1 SiTurnPsnErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Single turn position unreliable
xx229	Ch1 MulTrnPsnErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Multiple turn position unreliable
xx236	Ch1 AnalVal Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Analog value error (process data)
xx237	Ch1 SendCurr Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Transmitter current critical (dirt, broken transmitter)
xx238	Ch1 EncTemp Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Encoder temperature critical
xx239	Ch1 Speed Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by Stegmann Encoder on Channel 1 with Hiperface Interface - Speed too high, no position formation possible
xx240	Ch1 General Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - An error bit of the BiSS Single Cycle Data is set
xx246	Ch1 LED Curr Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - LED current out of control range

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx247	Ch1 ExMulTurnErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - External multiturn error
xx248	Ch1 PsnCode Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - Position code error (single step error)
xx249	Ch1 Config Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - failure configuring interface
xx250	Ch1 PsnVal Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - Position data not valid
xx251	Ch1 SerialComErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - Serial interface failure
xx252	Ch1 Ext Failure	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - External failure over NERR
xx253	Ch1 Temp Exc Err	Configurable		P39 [FB1 Loss Cfg]		Error reported by a Encoder on Channel 1 with BiSS Interface - Temperature out of defined range
xx256	Ch1 OutOfRailErr	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Rail is no longer present between the read head
xx260	Ch1 Read Head 1	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates that the read head must be cleaned or installed correctly
xx261	Ch1 Read Head 2	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates that the read head must be cleaned or installed correctly
xx262	Ch1 RAM Error	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates a RAM error. Reading head needs to be repaired
xx263	Ch1 EPROM Error	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates a EPROM error. Reading head needs to be repaired
xx264	Ch1 ROM Error	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates a ROM error. Reading head needs to be repaired
xx266	Ch1 No Position	Configurable		P39 [FB1 Loss Cfg]		Error reported by a linear Stahl encoder on Channel 1 - Indicates that no position value was available - only possible following powerup or reset
xx281	Ch1 Msg Cheksum	Configurable		P39 [FB1 Loss Cfg]		Indicates the option card has detected a serial communications checksum error while attempting to communicate with the encoder on channel 1.
xx282	Ch1 Timeout	Configurable		P39 [FB1 Loss Cfg]		Indicates the option card has detected a serial communications timeout error while attempting to communicate with the encoder on channel 1.
xx283	Ch1 Comm	Configurable		P39 [FB1 Loss Cfg]		Indicates the option card has detected a serial communications error (other than checksum or timeout) while attempting to communicate with the encoder on channel 1.
xx284	Ch1 Diagnostic	Configurable		P39 [FB1 Loss Cfg]		Indicates the option card has detected a powerup diagnostic test failure for encoder channel 1.
xx285	Ch1 SpplyVltgRng	Configurable		P39 [FB1 Loss Cfg]		Indicates that the voltage source to the encoder 1 is out of range.
xx286	Ch1 SC Amplitude	Configurable		P39 [FB1 Loss Cfg]		Indicates that the encoder 1 signal amplitude is out of tolerance.
xx287	Ch1 Open Wire	Configurable		P39 [FB1 Loss Cfg]		Indicates that an open wire condition has been detected for encoder 1.
xx288	Ch1 Quad Loss	Configurable		P39 [FB1 Loss Cfg]		Indicates that a signal quadrature error has been detected for encoder 1
xx289	Ch1 Phase Loss	Configurable		P39 [FB1 Loss Cfg]		Indicates that an A or B signal of an A quad B incremental encoder on Channel 1 is disconnected.
xx290	Ch1 Unsupp Enc	Configurable		P39 [FB1 Loss Cfg]		Indicates that the connected encoder on Channel 1 is not supported
xx300	Ch1 FreqExc Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Frequency exceeded warning

Event No. ⁽¹⁾	Fault/Alarm Text	Type	Fault Action	Configuration Param	Auto Reset	Description
xx301	Ch1 TempExc Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Temperature exceeded warning
xx302	Ch1 LightLim Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Limit of light control reserve reached
xx303	Ch1 Battery Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Battery warning
xx304	Ch1 RefPoint Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by Heidenhain Encoder on Channel 1 with EnDat Interface - Reference point not reached
xx308	Ch1 General Alm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by a Encoder on Channel 1 with BiSS Interface - A warning bit of the BiSS Single Cycle Data is set
xx315	Ch1 Optics Alarm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by a linear Stahl encoder on Channel 1 - Displays an alarm when the Stahl optical system requires cleaning
xx316	Ch1 OutOfRailAlm	Alarm 1		P39 [FB1 Loss Cfg]		Alarm reported by a linear Stahl encoder on Channel 1 - Indicates that the read encoder count is at the maximum value (524287)
xx412	Hardware Err	Configurable		Either P9 [FB0 Loss Cfg] or P39 [FB1 Loss Cfg]		Indicates that there is a Hardware Error on the Feedback Option module.
xx413	Firmware Err	Configurable		Either P9 [FB0 Loss Cfg] or P39 [FB1 Loss Cfg]		Indicates that there is a Firmware Error on the Feedback Option module. A Firmware Error occurs if the Hardware and the downloaded Firmware are not compatible.
xx416	EncOut Cfct	Alarm 1		Either P9 [FB0 Loss Cfg] or P39 [FB1 Loss Cfg]		Indicates that there is one of the following problems with the Encoder Output: <ul style="list-style-type: none"> • The selection in the P80 [Enc Out Sel] is not possible since the required pins on the terminal blocks are already used for Feedback 0 or 1 according to P6 [FB0 Device Sel] and P36 [FB1 Device Sel]. • P80 [Enc Out Sel] is set to 2 "Sine Cosine" and there is no signal connected to the pins 1...4 of TB 1. • P80 [Enc Out Sel] is set to 2 "Sine Cosine," the value of P15/45 [FBX IncAndSC PPR] is not a power of two, and P84 [EncOut Z PPR] is not set to 0 "1 ZPulse." This is not allowed. • P80 [Enc Out Sel] is set to 3 "Channel X" or 4 "Channel Y" and there is no encoder connected to that channel. • P80 [Enc Out Sel] is set to 3 "Channel X" or 4 "Channel Y" and there is a linear encoder connected to this channel.
xx417	Safety Cfct	Alarm 1		Either P9 [FB0 Loss Cfg] or P39 [FB1 Loss Cfg]		Indicates that the Safety DIP switches are in an invalid position.
xx420	FB0FB1 Cfct	Alarm 2				Indicates that the combination of the feedback selection done with P6 [FB0 Device Sel] and P36 [FB1 Device Sel] is invalid, i.e. both feedbacks have Sin-Cos-Signals (There is only place for one set of Sin-Cos-Signals on the Terminal Blocks). The drive cannot be started until this configuration conflict is resolved.
xx421	Initializing	Alarm 2				Indicates that the Universal Feedback State Machine is in the Initialize State. This Type 2 alarm makes sure that the motor cannot be started during this.

(1) xx indicates the port number. Refer to [Fault and Alarm Display Codes on page 4-4](#) for an explanation.

Common Symptoms and Corrective Actions

Drive does not Start from Start or Run Inputs wired to the terminal block.

Cause(s)	Indication	Corrective Action
Drive is Faulted	Flashing red status light	Clear fault. <ul style="list-style-type: none"> • Press Stop • Cycle power • “Clear Faults” on the HIM Diagnostic menu.
Incorrect input wiring. See page 1-38 for wiring examples. <ul style="list-style-type: none"> • 2 wire control requires Run, Run Forward, Run Reverse or Jog input. • 3 wire control requires Start and Stop inputs. • Verify 24 Volt Common is connected to Digital Input Common. 	None	Wire inputs correctly.
Incorrect digital input programming. <ul style="list-style-type: none"> • Mutually exclusive choices have been made (i.e., Jog and Jog Forward). • 2 wire and 3 wire programming may be conflicting. • Start configured without a Stop configured. 	None Flashing yellow status light and “DigIn Cnfg B” or “DigIn Cnfg C” indication on LCD HIM. P936 [Drive Status 2] shows type 2 alarm(s).	Configure input function. Resolve input function conflicts.
Terminal block does not have control.	None	Check P324 [Logic Mask].

Drive does not Start from HIM.

Cause(s)	Indication	Corrective Action
Drive is configured for 2 wire level control.	None	Change P150 [Digital In Conf] to correct control function.
Another device has Manual control.	None	
Port does not have control.	None	Change P324 [Logic Mask] to enable correct port.

Drive does not respond to changes in speed command.

Cause(s)	Indication	Corrective Action
No value is coming from the source of the command.	LCD HIM Status Line indicates “At Speed” and output is 0 Hz.	1. If the source is an analog input, check wiring and use a meter to check for presence of signal. 2. Check P2 [Commanded SpdRef] for correct source. (See page 3-19)
Incorrect reference source has been programmed.	None	3. Check P545 [Spd Ref A Sel] for the source of the speed reference. (See page 3-64) 4. Reprogram P545 [Spd Ref A Sel] for correct source. (See page 3-64)
Incorrect Reference source is being selected via remote device or digital inputs.	None	5. Check P935 [Drive Status 1], page 3-101 , bits 12 and 13 for unexpected source selections. 6. Check P220 [Digital In Sts], page 3-35 to see if inputs are selecting an alternate source. 7. Check configuration of P173-175 [DI Speed Sel X] functions

Motor and/or drive will not accelerate to commanded speed.

Cause(s)	Indication	Corrective Action
Acceleration time is excessive.	None	Reprogram P535/536 [Accel Time X]. (See page 3-63)
Excess load or short acceleration times force the drive into current limit, slowing or stopping acceleration.	None	Check P935 [Drive Status 1], bit 27 to see if the drive is in Current Limit. (See page 3-101) Remove excess load or reprogram P535/536 [Accel Time X].(See page 3-63)
Speed command source or value is not as expected.	None	Check for the proper Speed Command using Steps 1 through 7 above.
Programming is preventing the drive output from exceeding limiting values.	None	Check P520 [Max Fwd Speed], P521 [Max Rev Speed] (See page 3-62) and P37 [Maximum Freq] (See page 3-21) to assure that speed is not limited by programming.

Motor operation is unstable.

Cause(s)	Indication	Corrective Action
Motor data was incorrectly entered or Autotune was not performed.	None	1. Correctly enter motor nameplate data. 2. Perform “Static Tune” or “Rotate Tune” Autotune procedure. See P70 [Autotune] on page 3-24

Drive will not reverse motor direction.

Cause(s)	Indication	Corrective Action
Digital input is not selected for reversing control.	None	Check that the DI Reversing function is correctly configured.
Digital input is incorrectly wired.	None	Check digital input wiring.
Direction mode parameter is incorrectly programmed.	None	Reprogram P308 [Direction Mode], page 3-43 for analog “Bipolar” or digital “Unipolar” control.
Motor wiring is improperly phased for reverse.	None	Switch two motor leads.
A bipolar analog speed command input is incorrectly wired or signal is absent.	None	1. Use meter to check that an analog input voltage is present. 2. Check bipolar analog signal wiring. Positive voltage commands forward direction. Negative voltage commands reverse direction.

Stopping the drive results in a Decel Inhibit fault.

Cause(s)	Indication	Corrective Action
The bus regulation feature is enabled and is halting deceleration due to excessive bus voltage. Excess bus voltage is normally due to excessive regenerated energy or unstable AC line input voltages. Internal timer has halted drive operation.	Decel Inhibit fault screen. LCD Status Line indicates “Faulted”.	1. Reprogram parameters 372/373 [Bus Reg Mode X] to eliminate any “Adjust Freq” selection. 2. Disable bus regulation (parameters 372/373 [Bus Reg Mode X]) and add a dynamic brake. 3. Correct AC input line instability or add an isolation transformer. 4. Reset drive.

Technical Support Options What You Need When You Call Tech Support

When you contact Technical Support, please be prepared to provide the following information:

- Order number
- Product catalog number and drives series number (if applicable)
- Product serial number
- Firmware revision level
- Fault code listed in P951 [Last Fault Code]
- Installed options and port assignments

Also be prepared with:

- A description of your application
- A detailed description of the problem
- A brief history of the drive installation
 - First-time installation, product has not been running
 - Established installation, product has been running

The data contained in the following parameters will help in initial troubleshooting of a faulted drive. You can use the table below to record the data provided in each parameter listed.

Parameter(s)	Name	Description	Parameter Data
956	Fault Frequency	Captures and displays the output speed of drive at time of last fault.	
957	Fault Amps	Captures and displays motor amps at time of last fault.	
958	Fault Bus Volts	Captures and displays the DC bus voltage of drive at time of last fault.	
954	Status1 at Fault	Captures and displays [Drive Status 1] bit pattern at time of last fault.	
955	Status2 at Fault	Captures and displays [Drive Status 2] bit pattern at time of last fault.	
962	AlarmA at Fault	Captures and displays [Alarm Status A] bit pattern at time of last fault.	
963	AlarmB at Fault	Captures and displays [Alarm Status B] bit pattern at time of last fault.	
951	Last Fault Code	A code that represents the fault that tripped the drive.	

Technical Support Wizards

If you are connected to a drive via DriveExplorer™ or DriveExecutive™, you can run a Tech Support wizard to gather information that will help diagnose problems with your drive and/or peripheral device. The information gathered by the wizard is saved as a text file and can be emailed to your remote technical support contact.

To run a Tech Support wizard in DriveExplorer, select **Wizards** from the **Actions** menu. In DriveExecutive, select **Wizards** from the **Tools** menu. Or, click the  button. Follow the prompts to complete the wizard.

Important: The Tech Support wizard cannot be accessed when the Control Bar is launched.

Supplemental Drive Information

Specifications

Category	PowerFlex 755					
Certifications		Listed to UL508C and CAN/CSA-C22.2 No. 14-05.				
		In conformity with the following European Directives: EMC Directive (2004/108/EC) Low Voltage Directive (2006/95/EC) Standards applied: EN 61800-3:2004 EN 61800-5-1:2007				
	     	TÜV Rheinland Standards applied: EN 61800-3:2004 EN 61800-5-1:2007 EN ISO 13849-1:2008 EN ISO 13849-2:2003 EN 61800-5-2:2007 EN 61508 PARTS 1-7:2000 EN 62061:2005 EN 60204-1:2006				
		Australian Communications and Media Authority In conformity with the following: Radiocommunications Act: 1992 Radiocommunications Standard: 2008 Radiocommunications Labelling Notice: 2008 Standards applied: EN 61800-3:2004				
	 	Electric Power Research Institute Certified compliant with the following standards: SEMI F47 IEC 61000-4-34				
	GOST-R	Russian GOST-R Certificate no. POCC US.ME92.H00040				
	RoHS	Compliant with the European "Restriction of Hazardous Substances" Directive				

Category	Specification					
Protection	Drive	380/400	480V	500V	600V	690V
	AC Input Overvoltage Trip:	576V AC	576V AC			
	AC Input Undervoltage Trip:	250V AC	300V AC			
	Bus Overvoltage Trip:	815V DC	815V DC			
	Bus Undervoltage Shutoff:	200V DC	200V DC			
	Nominal Bus Voltage (Full Load):	540V DC	648V DC			
	Drive Overcurrent Trip	Calculated value, 105% of motor rated to 200% of drive rated				
	Software Overcurrent Trip:	105% of 3 sec. rating (158...210%)				
	Hardware Overcurrent Trip:	143% of 3 sec. rating (215...287%)				
	Instantaneous Current Limit:					
	Line transients:	up to 6000 volts peak per IEEE C62.41-1991				
	Control Logic Noise Immunity:	Showering arc transients up to 1500V peak				
	Power Ride-Thru:	15 milliseconds at full load				
	Logic Control Ride-Thru:	0.5 seconds minimum, 2 seconds typical				
Ground Fault Trip:	Phase-to-ground on drive output					
Short Circuit Trip:	Phase-to-phase on drive output

Surrounding Environment																		
Pollution Degree																		
Pollution Degree 1 & 2:		All enclosures acceptable.																
Pollution Degree 3 & 4:		Enclosure that meets or exceeds IP54, NEMA/UL Type 12 required.																
(See page A-7 for descriptions of each pollution degree rating.)																		

Category	Specification	
Electrical	AC Input Voltage Tolerance:	See page C-1 for full power and operating range.
	Frequency Tolerance:	47-63 Hz.
	Input Phases:	Three-phase input provides full rating for all drives. Single-phase operation provides up to 50% of rated current.
	DC Input Voltage Tolerance:	-/+ 10% of Nominal Bus Voltage (above)
	Displacement Power Factor:	0.98 across entire speed range.
	DC Link Inductance:	≥ 5%
	Efficiency:	97.5% at rated amps, nominal line volts.
	Maximum Short Circuit Rating:	200,000 Amps RMS symmetrical.
	Actual Short Circuit Rating:	Determined by AIC rating of installed fuse/circuit breaker.
	Maximum Drive to Motor Power Ratio	Recommended not greater than 2:1 ratio.
Control	Method:	Sine coded PWM with programmable carrier frequency. Ratings apply to all drives. The drive can be supplied as 6 pulse.
	Carrier Frequency:	Default Settings: Drive Frames 2...4: 4 kHz Drive Frames 5...7: 2 kHz Settings: Drive Frames 2...6: 2, 4, 8, 12 kHz Drive Frame 7: 2, 4, 8 kHz
	Output Voltage Range:	0 to rated motor voltage
	Output Frequency Range:	0...325 Hz @ 2 kHz carrier 0...650 Hz @ 4 kHz carrier
	Frequency Accuracy Digital Input: Analog Input:	Within ±0.01% of set output frequency. Within ±0.4% of maximum output frequency.
	Frequency Control:	Speed regulation - with Slip Compensation 0.5% of base speed across 40:1 speed range 40:1 operating range
	Speed Control:	Speed regulation - without feedback 0.1% of base speed across 120:1 speed range 120:1 operating range 50 rad/sec bandwidth
		Speed regulation - with feedback 0.001% of base speed across 100:1 speed range 1000:1 operating range 190 rad/sec bandwidth
	Torque Regulation:	Torque Regulation - without feedback ±5%, 600 rad/sec bandwidth
		Torque Regulation - with feedback ±2%, 2500 rad/sec bandwidth
	Selectable Motor Control:	Standard V/Hz with full custom capability. Sensorless Vector with full tuning. Flux Vector with and without a feedback device. Induction and Permanent magnet motor control.
	Stop Modes:	Multiple programmable stop modes including - Ramp, Coast, DC-Brake, Ramp-to-Hold, Fast Braking, and Current Limit Stop.
	Accel/Decel:	Two independently programmable accel and decel times. Each time may be programmed from 0 to 3600 seconds in 0.1 second increments.
	S Curve Time	Adjustable from 0 to 100% of ramp time (normal duty rating).
	Intermittent Overload:	110% Overload capability for up to 1 minute 150% Overload capability for up to 3 seconds
Current Limit Capability:	Proactive Current Limit programmable from 20 to 160% of rated output current. Independently programmable proportional and integral gain.	
Electronic Motor Overload Protection:	Class 10 protection with speed sensitive response. Complies with N.E.C. Article 430. U.L. File E59272, volume 12.	

Ports and Devices

Connectors, embedded devices, and installed option modules such as I/O, communication adapters, and DeviceLogix, have unique port number assignments. Connectors and embedded devices have fixed port numbers that cannot be changed. Option modules are assigned a port number when installed.

Figure A.1 Drive Device Ports

Port	Device	Description
00	Host Drive	Fixed port for the drive.
01	HIM	Fixed port at HIM cradle connector. Splitter cable connector provides Port 01 when HIM cradle connector is unused.
02	DPI Port	Handheld or Remote HIM connection. Splitter cable connection.
03	Splitter Cable	Connects to DPI Port 02. Provides Port 02 and Port 03.
04...08	Option Modules	Available ports for option modules. Refer to the I/O Wiring section, beginning on page 1-28 , for each option's port recommendations. (Ports 07 and 08 PowerFlex 755 drives only.)
09...12	Reserved for future use.	
13	EtherNet/IP	Fixed port for embedded EtherNet/IP (PowerFlex 755 drives only).
14	DeviceLogix	Fixed port for embedded DeviceLogix (PowerFlex 755 drives only).

Watts Loss

Table A.A 400 Volt Ratings - Watts Loss

Frame ⁽¹⁾	ND kW	External Watts	Internal Watts	Total Watts

Pollution Degree Ratings According to EN 61800-5-1

Pollution Degree	Description
1	No pollution or only dry, non-conductive pollution occurs. The pollution has no influence.
2	Normally, only non-conductive pollution occurs. Occasionally, however, a temporary conductivity caused by condensation is to be expected, when the drive is out of operation.
3	Conductive pollution or dry non-conductive pollution occurs, which becomes conductive due to condensation, which is to be expected.
4	The pollution generates persistent conductivity caused, for example by conductive dust or rain or snow.

Drive Enclosure Ratings

Frames	Enclosure Type (Cat. No. Position 6)	Installed Accessory Kit	Front Side Rating		Back Side/Heat Sink Rating

Communication Configurations

20-COMM-* Network Adapter Compatibility

Some 20-COMM adapters can be used with PowerFlex 750-Series drives. See [page 1-49](#) for more information.

Typical Programmable Controller Configurations

Important: If block transfers are programmed to continuously write information to the drive, care must be taken to properly format the block transfer. If attribute 10 is selected for the block transfer, values will be written only to RAM and will not be saved by the drive. This is the preferred attribute for continuous transfers. If attribute 9 is selected, each program scan will complete a write to the drives non-volatile memory (EEPROM). Since the EEPROM has a fixed number of allowed writes, continuous block transfers will quickly damage the EEPROM. Do Not assign attribute 9 to continuous block transfers. Refer to the individual communications adapter User Manual for additional details.

Logic Command/Status Words

(1) A Not Stop condition (logic bit 0 = 0) must first be present before a 1 = Start condition will start the drive.
(2) A Not Stop condition (logic bit 0 = 0) must first be present before a 1 = Jog 1/Jog 2 condition will jog the drive. A transition to a "0" will stop the drive.
(3) To perform this command, the value must switch from "0" to "1."
(4) A Not Stop condition (logic bit 0 = 0) must first be present before a 1 = Run condition will run the drive. A transition to a "0" will stop the drive.

Output Devices

Common mode cores are internal to the drive.

Drive, Fuse & Circuit Breaker Ratings

[Table A.H](#) and [Table A.I](#) provide drive ratings (including continuous, 1 minute and 3 second) and recommended AC line input fuse and circuit breaker information. Sizes listed are the recommended sizes based on 40 degree C and the U.S. N.E.C. Other country, state or local codes may require different ratings.

Refer to [Table A.G](#) which describes input device requirements based on physical installation choice.

Table A.G Input Device Requirements

Frames	Enclosure Catalog Code	Enclosure Type	Installation Type	UL Certification Required	UL Certification Not Required
2, 3, 4, 5	N	IP20 NEMA/UL Open Type	Installed in a non-ventilated cabinet. Heat sink is inside or outside of cabinet.	All devices in Tables A.H and A.I are acceptable.	All devices in Tables A.H and A.I are acceptable.
	F	Flange			
	N	IP20 NEMA/UL Open Type	Installed outside of cabinet using NEMA Type 1 kit or in a ventilated cabinet.	Devices in Tables A.H and A.I excluding time delay fuses and maximum value for non-time delay fuses.	
	F	Flange			
	G	IP54 NEMA/UL Type 12	Installed inside or outside of any cabinet.	All devices in Tables A.H and A.I are acceptable.	
6, 7	N	IP00 NEMA/UL Open Type	Installed in any cabinet. Heat sink is inside or outside of cabinet.	All devices in Tables A.H and A.I are acceptable.	
			Installed outside of cabinet using NEMA Type 1 kit.		
	G	IP54 NEMA/UL Type 12	Installed inside or outside of any cabinet.	All devices in Tables A.H and A.I are acceptable.	

Fusing

If fuses are chosen as the desired protection method, refer to the recommended types listed below. If available amp ratings do not match the tables provided, the closest fuse rating that exceeds the drive rating should be chosen.

- IEC – BS88 (British Standard) Parts 1 & 2⁽¹⁾, EN60269-1, Parts 1 & 2, type gG or equivalent should be used.
- UL – UL Class T, J or L should be used.

Circuit Breakers

The “non-fuse” listings in the following tables include both circuit breakers (inverse time or instantaneous trip). **If one of these is chosen as the desired protection method**, the following requirements apply.

- IEC and UL – Both types of devices are acceptable for IEC and UL installations.

⁽¹⁾ Typical designations include, but may not be limited to the following: Parts 1 & 2: AC, AD, BC, BD, CD, DD, ED, EFS, EF, FF, FG, GF, GG, GH.

Table A.H 400 Volt AC Input Protection Devices

Notes:

- (1) "Applied Rating" refers to the motor that will be connected to the drive. For example, a "C015 drive" can be used in Normal Duty mode on a 7.5 kW motor, or in Heavy Duty mode on a 5.5 kW motor. The drive can be programmed for either mode. Wiring and fuses can be sized based on the programmed mode. For any given drive catalog number, Normal Duty mode provides higher continuous current but smaller overload current with respect to Heavy Duty mode. See parameter 306 [Duty Rating].
- (2) Enclosure codes F and N only. See Table A.J for frame sizes of other enclosure types.
- (3) Minimum protection device size is the lowest rated device that supplies maximum protection without nuisance tripping.
- (4) Maximum protection device size is the highest rated device that supplies drive protection. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.
- (5) Circuit Breaker - inverse time breaker. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.
- (6) Recommended Motor circuit protector - Instantaneous trip circuit breaker. The trip setting should be set to the input current of the drive and should be sized for the continuous current of the system.
- (7) Bulletin 140M with adjustable current range should have the current trip set to the minimum range that the device will not trip.
- (8) Manual Self-Protected (Type E) Combination Motor Controller. 480Y/277V and 600Y/347V AC Input.

Notes:

- (1) "Applied Rating" refers to the motor that will be connected to the drive. For example, a "D014 drive" can be used in Normal Duty mode on a 7.5 Hp motor. The drive can be programmed for either mode. Wiring and fuses can be sized based on the programmed mode. For any given drive catalog number, Normal Duty mode provides higher continuous current but smaller overload current with respect to Heavy Duty mode. See parameter 306 [Duty Rating].
- (2) Enclosure codes F and N only. See [Table A.J](#) for frame sizes of other enclosure types.
- (3) Minimum protection device size is the lowest rated device that supplies maximum protection without nuisance tripping.
- (4) Maximum protection device size is the highest rated device that supplies drive protection. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.
- (5) Circuit Breaker - inverse time breaker. For US NEC, minimum size is 125% of motor FLA. Ratings shown are maximum.
- (6) Recommended Motor circuit protector - Instantaneous trip circuit breaker. The trip setting should be set to the input current of the drive and should be sized for the continuous current of the system.
- (7) Bulletin 140M with adjustable current range should have the current trip set to the minimum range that the device will not trip.
- (8) Manual Self-Protected (Type E) Combination Motor Controller. 480Y/277V and 600Y/347V AC Input.

Application Notes

Voltage Tolerance

Drive Rating	Nominal Line Voltage	Nominal Motor Voltage	Drive Full Power Range	Drive Operating Range
380...400	380	380	380...528	342...528
	400	400	400...528	
	480	460	460...528	

Drive Full Power Range = Nominal Motor Voltage to Drive Rated Voltage + 10%.
Rated current is available across the entire Drive Full Power Range

Drive Operating Range = Lowest Nominal Motor Voltage - 10% to Drive Rated Voltage + 10%.
Drive Output is linearly derated when Actual Line Voltage is less than the Nominal Motor Voltage

Example:

Calculate the maximum power of a 5 Hp, 460V motor connected to a 480V rated drive supplied with 342V Actual Line Voltage input.

- $\text{Actual Line Voltage} / \text{Nominal Motor Voltage} = 74.3\%$
- $74.3\% \times 5 \text{ HP} = 3.7 \text{ HP}$
- $74.3\% \times 60 \text{ Hz} = 44.6 \text{ Hz}$

At 342V Actual Line Voltage, the maximum power the 5 HP, 460V motor can produce is 3.7 HP at 44.6 Hz.

External Brake Resistor

ATTENTION: The drive does not offer protection for externally mounted brake resistors. A risk of fire exists if external braking resistors are not protected. External resistor packages must be self-protected from over temperature or a circuit equivalent to the one shown below must be supplied.

Figure C.1 External Brake Resistor Circuitry

Lifting/Torque Proving

The TorqProve™ feature of PowerFlex 750-Series drives is intended for applications where proper coordination between motor control and a mechanical brake is required. Prior to releasing a mechanical brake, the drive will check motor output phase continuity and verify proper motor control (torque proving). The drive will also verify that the mechanical brake has control of the load prior to releasing drive control (brake proving). After the drive sets the brake, motor movement is monitored to ensure the brakes ability to hold the load.

ATTENTION: Loss of control in suspended load applications can cause personal injury and/or equipment damage. Loads must always be controlled by the drive or a mechanical brake. Parameters 1100...1113 are designed for lifting/torque proving applications. It is the responsibility of the engineer and/or end user to configure drive parameters, test any lifting functionality and meet safety requirements in accordance with all applicable codes and standards.

TorqProve can be operated with an encoder or encoderless. See “Attention” on [page C-4](#) prior to the use of TorqProve with no encoder.

TorqProve functionality with an encoder includes:

- Torque Proving (includes flux up and last torque measurement)
- Brake Proving
- Brake Slip (feature slowly lowers load if brake slips/fails)
- Float Capability (ability to hold full torque at zero speed)
- Micro-Positioning
- Fast Stop
- Speed Deviation Fault, Output Phase Loss Fault, Encoder Loss Fault.

Encoderless TorqProve functionality includes:

- Torque Proving (includes flux up and last torque measurement)
- Micro-Positioning
- Fast Stop
- Speed Deviation Fault, Output Phase Loss Fault.

Important: Brake Slip detection and Float capability (ability to hold load at zero speed) are not available in encoderless TorqProve.

ATTENTION: User must read the following prior to the use of TorqProve with no encoder.

Encoderless TorqProve must be limited to lifting applications where personal safety is not a concern. Encoders offer additional protection and must be used where personal safety is a concern. Encoderless TorqProve cannot hold a load at zero speed without a mechanical brake and does not offer additional protection if the brake slips/fails. Loss of control in suspended load applications can cause personal injury and/or equipment damage.

It is the responsibility of the engineer and/or user to configure drive parameters, test any lifting functionality and meet safety requirements in accordance with all applicable codes and standards. If encoderless TorqProve is desired, the user must certify the safety of the application. To acknowledge that the end user has read this “Attention” and properly certified their encoderless application, bit 3 (“EnclsTrqProv”) of [Mtr Options Cnfg], parameter 40 must be changed to a “1.” This will remove Alarm 28, “TP Encls Config” and allow bit 1 of Parameter 1100 to be changed to a “1” enabling encoderless TorqProve.

Tuning The Motor For Torque Prove Applications

It is possible to use the Start-Up routine ([See page 2-3](#)) to tune the motor. However, it is recommended that the motor be disconnected from the hoist/crane equipment during the routine

ATTENTION: To guard against personal injury and/or equipment damage caused by unexpected brake release, verify that the digital output used for brake connections and/or programming. The PowerFlex 750-Series drive **will not control the mechanical brake until TorqProve is enabled**. If the brake is connected to a digital output, it could be released. If necessary, **disconnect the digital output until wiring/programming can be completed and verified**.

Human Interface Module (HIM) Overview

Complete information about using the HIM (Catalog Numbers 20-HIM-A6 and 20-HIM-C6S) to configure and monitor your drive is provided in the Enhanced PowerFlex 7-Class Human Interface Module (HIM) User Manual, publication 20HIM-UM001.

LCD Display Elements

The HIM display is divided into three zones:

- ❶ Status Bar
- ❷ Data Area
- ❸ Soft Key Labels

Figure D.1 HIM Display Zones

Status Bar

The Status Bar provides information about the operating condition of the Host Drive.

Figure D.2 Status Bar on the Display Screen

Element	Description	
	Host Icon	A small image of the connected Host Drive.
Stopped	Status Text	Indicates current Host Drive operating status. Text flashes when a fault is present.
0.00 Hz	Feedback	Indicates drive output feedback (for example, Hz, RPM, amps, etc.)
AUTO / MAN	Mode Indication	Indicates Auto or Manual HIM status.
	Alarm Indication	Bell icon indicates that an alarm is present.
	Rotation Indication	Indicates direction of Host Drive operation.

Soft Keys

Up to five dynamic *soft keys* (shown shaded in [Figure D.3](#)) may be available. A *soft key* changes its function/name based on the HIM screen or data entry mode. When a *soft key* is active, its present function is shown on the LCD screen in its corresponding Soft Key Label (item 3 in [Figure D.1](#)).

Figure D.3 Soft Keys

Navigation and Number Keys

The five blue multi-function keys shown in [Figure D.4](#) are used to scroll menus/screens, perform corresponding functions displayed in the Data Area (item 2 in [Figure D.1](#)) or enter numeric values. The five gray number keys (0, 1, 3, 7, and 9) are used only to enter their respective numeric value.

Figure D.4 Navigation and Number Keys

Key	Name	Description
	2/Down Arrow	<ul style="list-style-type: none"> Enters the numeric value "2." Scrolls down to select an item.
	4/Left Arrow	<ul style="list-style-type: none"> Enters the numeric value "4." Scrolls left to select an item.
	5/Enter	<ul style="list-style-type: none"> Enters the numeric value "5." Displays the next level of a selected menu item. Enters new values. Performs intended actions.
	6/Right Arrow	<ul style="list-style-type: none"> Enters the numeric value "6." Scrolls right to select an item.
	8/Up Arrow	<ul style="list-style-type: none"> Enters the numeric value "8." Scrolls up to select an item.

Single Function Keys

Each of the four single-function keys shown in [Figure D.5](#) always performs only its dedicated function.

Figure D.5 Single Function Keys

Key	Name	Description
	Start	Start the drive.
	Folder	Access parameters, diagnostics, memory functions, preferences, and other tasks such as Start-Up.
	Control Bar	Access jog, direction, auto/manual, and other control functions.
	Stop	Used to stop the drive or clear a fault. This key is always active. Controlled by parameter 370 [Stop Mode A].

Navigate to Start-Up Menu Using the HIM

1. To access the Start-Up menu after the initial drive power-up, apply power to the drive.

Upon a subsequent power up, the Status screen for Port 00 (Host Drive) is shown by default.

Figure D.6 Status Screen

2. Press the  (Folders) key to access the Folder screen.

Figure D.7 Folder Screen

3. Use the  or  key to scroll to the START UP folder screen.

Figure D.8 Start Up Screen

4. Use the  or  key to select one of the start up options.

Select A Device

1. Access the Status Screen.

When the drive is powered up, the Status screen for Port 00 (Host Drive) is shown by default.

Figure D.9 Status Screen Displaying Port 00 (Host Drive)

2. Use the **4** or **6** key to scroll to the desired port.

Figure D.10 Status Screen Displaying Port 01 (HIM Installed In Cradle)

3. Press the PAR# soft key or the  (Folders) key to access parameters.

Setting Factory Defaults

Setting PowerFlex 750-Series Drives to Factory Defaults

1. Access the Status screen ([Figure D.6](#)).
2. Use the  or  key to scroll to the Port 00 for the Host Drive whose settings you want to reset to factory defaults.
3. Press the  key to display its last-viewed folder.
4. Use the  or  key to scroll to the MEMORY folder.
5. Use the  or  key to select **Set Defaults**.
6. Press the  (Enter) key to display the Set Defaults pop-up box.

Figure D.11 Set Defaults Pop-Up Box for PowerFlex 750-Series Drives

7. Use the  or  key to select the appropriate action.
 - Host and Ports (Preferred): Selects the Host device and all ports for a factory default action.
 - This Port Only: Selects only this port for a factory default action.

TIP: For a description of a selected menu item, press the *INFO soft key*.

8. Press the  (Enter) key to display the warning pop-up box to reset defaults.

Figure D.12 Host and Ports (Preferred) Pop-Up Box

Press the *ENTER soft key* to affirm and set most parameters for the Host Drive and port devices to factory defaults. In this case, refer to [Table D.A](#) for the settings that will NOT be restored. Or press the *ESC soft key* to cancel.

Figure D.13 This Port Only Pop-Up Box

Press the *MOST soft key* to set MOST settings for the selected port device to factory defaults. In this case, refer to [Table D.A](#) for the settings that will NOT be restored. Press the *ALL soft key* to set ALL settings for the selected port device to factory defaults. Or press the *ESC soft key* to cancel.

Table D.A Parameters Unaffected By Reset Option Most

Setting PowerFlex 750-Series Peripherals to Factory Defaults

1. Access the Status screen (Figure D.6).
2. Use the  or  key to scroll to the Port of the device whose parameters you want to set to factory defaults (for example, Port 13, which is dedicated for the embedded EtherNet/IP communication adapter on the main control board in PowerFlex 755 drives).
3. Press the  key to display its last-viewed folder.
4. Use the  or  key to scroll to the MEMORY folder.
5. Use the  or  key to select **Set Defaults**.
6. Press the  (Enter) key to display the Set Defaults pop-up box.

Figure D.14 Set Defaults Pop-Up Box for PowerFlex 750-Series Peripherals

- This Port Only: Selects only this port for a factory default action.

▶ **TIP:** For a description of a selected menu item, press the **INFO** *soft key*.

7. Press the  (Enter) key to display the warning pop-up box to reset defaults.

Figure D.15 Warning Pop-Up Box to Reset Factory Defaults

8. Press the **MOST** *soft key* to set MOST settings for the selected port device to factory defaults. In this case, refer to the port device User Manuals for the settings that will NOT be restored. Press the **ALL** *soft key* to set ALL settings for the selected port device to factory defaults. Or press the **ESC** *soft key* to cancel.

Setting PowerFlex 7-Class Drives/Peripherals to Factory Defaults

1. Access the Status screen ([Figure D.6](#)).
2. Use the  or  key to scroll to the Port of the device whose parameters you want to set to factory defaults (for example, Port 00 for the Host Drive).
3. Press the  key to display its last-viewed folder.
4. Use the  or  key to scroll to the MEMORY folder.
5. Use the  or  key to select **Set Defaults**.
6. Press the  (Enter) key to display the Set Defaults pop-up box.

Figure D.16 Set Defaults Pop-Up Box

7. Press the ENTER *soft key* to affirm and set all device parameter values to factory defaults. Or press the ESC *soft key* to cancel.

Notes:

Universal Feedback Encoder Option Module

Wiring Examples	E-4

Specifications

Important: The Universal Feedback Encoder can only be used with PowerFlex 755 drives.

Table E.A Universal Feedback Option Module LED Indication

LED	Name	Color	State	Description		
①	Board	Unlit	Off	Not powered.		
		Green	Flashing	Initializing, not active. Communication lost, attempting to reconnect.		
			Steady	Operational, no faults are present.		
		Red	Flashing	Module error. • Check P1 [Module Sts]		
			Steady	Normal operation. Module is booting. Fatal module error. • Cycle power • Flash update module firmware • Replace module		
				Yellow	A type 2 alarm condition exists. • Check P1 [Module Sts]	
		Yellow / Green Alternately	Flashing	A type 1 alarm condition exists. • Check P1 [Module Sts]		
			Steady	Module is flash updating.		
		②	DPI	Unlit	Off	Not powered. Not communicating.
				Green	Flashing	Module is attempting to communicate with the DPI host.
					Steady	• Properly connected and communicating. • Module is flash updating.
				Red	Flashing	Module is not communicating with the DPI host.
Steady	DPI communication failure such as invalid port.					
Yellow	Flashing			Normal operation.		
	Steady			Peripheral is connected to a SCANport product and does not support a SCANport compatibility mode.		

Table E.B Universal Feedback Option Module DIP Switch Settings (Safety Application)

Safety Channel Selection	DIP Switch Settings
<p>Primary Safety Channel To connect feedback signals to the Primary Safety Channel, set: S1 sliders to ON S2 sliders to OFF S3 slider to ON</p>	
<p>Secondary Safety Channel To connect feedback signals to the Secondary Safety Channel, set: S1 sliders to OFF S2 sliders to ON S3 slider to ON</p>	
<p>Primary and Secondary Safety Channels To connect feedback signals to both the Primary and Secondary Safety Channels, set: S1 sliders to ON S2 sliders to ON S3 slider to ON</p>	

Table E.C Universal Feedback Incremental AquadB Encoder

Consideration	Description
Input	Differential or Single Ended operation, Constant Current Sink operation ~10 mA 3.5V DC minimum to 7.5V DC maximum sourcing 10 mA minimum high state voltage of 3.5V DC maximum low state voltage of 0.4V DC
Maximum Cable Length:	30 m (100 ft) @ 5V, 183 m (600 ft) @ 12V
Maximum Input Frequency	250 kHz

Table E.D Supported Encoders

Consideration	Heidenhain (EnDat)	SSI	Stegmann (Hiperface)	BiSS	Stahl (linear)	Temposonics (linear)
Encoder Voltage Supply	5V @ 250 mA	10.5V @ 250 mA	10.5V @ 250 mA	10.5V @ 250 mA	External Supplied 24V	External Supplied 24V
High-Resolution Signal	Sine/Cosine 1V P-P	Sine/Cosine 1V P-P	Sine/Cosine 1V P-P	Sine/Cosine 1V P-P	n/a	n/a
Maximum Cable Length	100 m	100 m	90 m	100 m	100 m	100 m
Update Rate ⁽¹⁾	102.4 μs	102.4 μs	102.4 μs	102.4 μs	0.5/1.0/1.5/2.0 ms	0.5/1.0/1.5/2.0 ms
Maximum Input Frequency	163.8 kHz	163.8 kHz	163.8 kHz	163.8 kHz	n/a	n/a

⁽¹⁾ The Universal Feedback Encoder Option Module will acquire the position with the update rates displayed.

Terminal Block Designations

Table E.E Universal Feedback Encoder Option Module TB1 Terminal Designations

Terminal	Name	Description
-Sn	Sine (-)	Negative Sine signal
+Sn	Sine (+)	Positive Sine signal
-Cs	Cosine (-)	Negative Cosine signal
+Cs	Cosine (+)	Positive Cosine signal
Is	Inner Shield	Heidenhain inner shield terminal
Os	Outer Shield	Cable shield terminal
-Xc	Channel X Clock (-)	Negative clock terminal (Channel X)
+Xc	Channel X Clock (+)	Positive clock terminal (Channel X)
-Xd	Channel X Data (-)	Negative data terminal (Channel X)
+Xd	Channel X Data (+)	Positive data terminal (Channel X)
-Hf	Heidenhain Supply Feedback (-)	For incremental feedback applications, tie terminal -Hf to 5c and terminal +Hf to +5 for proper voltage regulation.
+Hf	Heidenhain Supply Feedback (+)	
5c	Common	+5V Common
+5	+5 Volt DC Power	Power supply for encoder 250 mA
12c	Common	+12V Common
+12	+12 Volt DC Power	Power supply for encoder (10.5V @ 250 mA)
-A	Encoder A (NOT)	Single channel or quadrature A input or encoder output.
A	Encoder A	
-B	Encoder B (NOT)	Quadrature B input or encoder output.
B	Encoder B	
-Z	Encoder Z (NOT)	Pulse, marker or registration input or encoder output.
Z	Encoder Z	

Table E.F Universal Feedback Encoder Option Module TB2 Terminal Designations

Terminal	Name	Description
-Hm	Home Input (-)	12V DC @ 9 mA to 24V DC @ 40 mA
+Hm	Home Input (+)	
-R0	Registration Input 0 (-)	Positive and negative encoder registration terminals. 12V DC @ 9 mA to 24V DC @ 40 mA
+R0	Registration Input 0 (+)	
-R1	Registration Input 1 (-)	
+R1	Registration Input 1 (+)	
-Yc	Channel Y Clock (-)	Negative clock terminal (Channel Y)
+Yc	Channel Y Clock (+)	Positive clock terminal (Channel Y)
-Yd	Channel Y Data (-)	Negative data terminal (Channel Y)
+Yd	Channel Y Data (+)	Positive data terminal (Channel Y)

Important: Only one linear feedback device can be connected to the option module. Wire the device to either Channel X on TB1 or Channel Y on TB2.

Parameter Access

Refer to [Select A Device on page D-5](#) for instructions on how to access parameters on an option module.

Parameter Descriptions

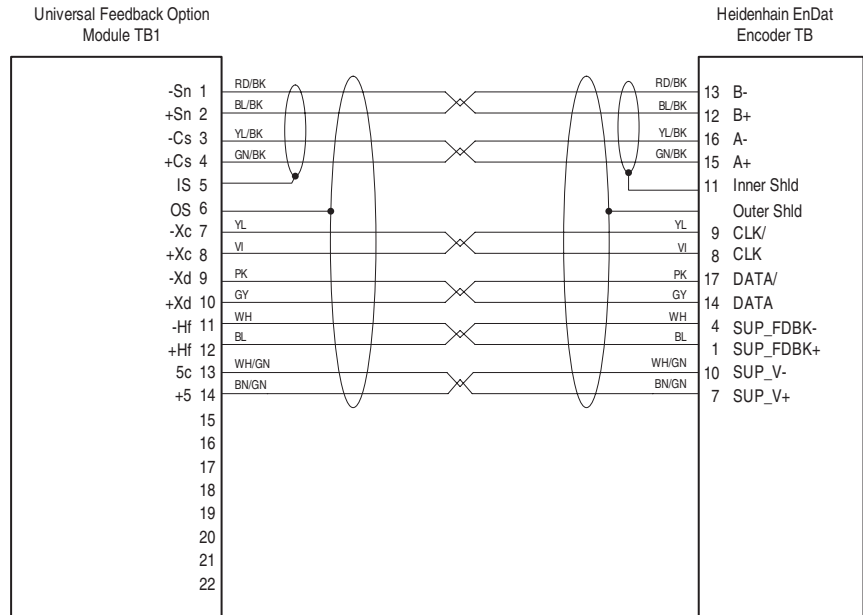

Universal Feedback option module parameter descriptions begin on [page 3-166](#).

Wiring Examples

The following table includes a list of motor, feedback device and cable wiring examples.

Figure E.1 Heidenhain EnDat Angle Encoder with Internal Power Supply

Note: Refer to Installation Instructions supplied with encoder for additional information.

Figure E.2 Heidenhain EnDat Angle Encoder with External Power Supply

Notes: Refer to Installation Instructions supplied with encoder for additional information. The external power supply must be 3.6V to 5.25V, max. 350mA. TB1-14 (Power+) and TB1-13 (Power-) must not be connected to the encoder. The brown/green and white/green conductors must be connected to the external power supply. If the external power supply does not have sense connections, the supply feedback (sense) connections should still be made from the encoder to the universal board (TB1-11,12).

Figure E.3 Heidenhain Non-EnDat Rotary Encoder with Internal Power Supply

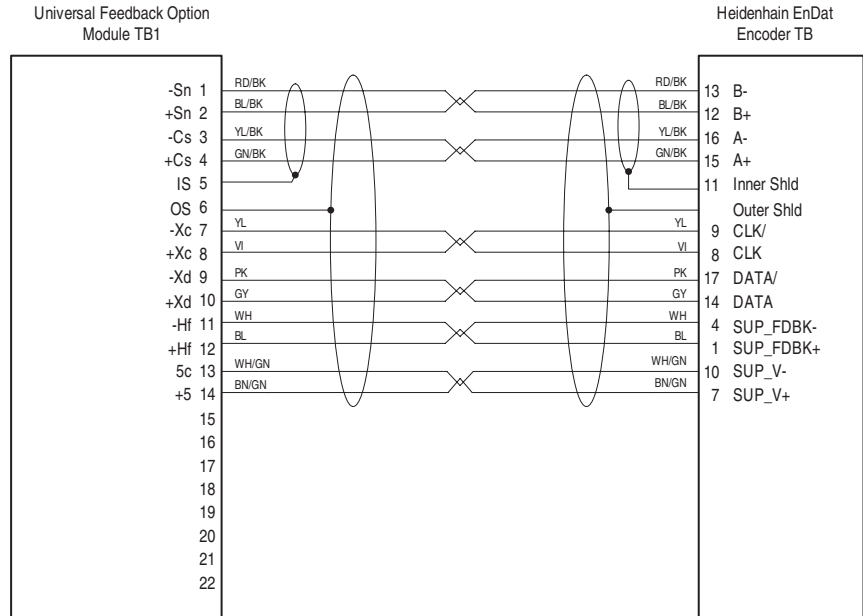

Note: Refer to Installation Instructions supplied with encoder for additional information.

Figure E.4 Heidenhain EnDat Rotary Encoder (ECN 412 EnDat01) with Internal Power Supply

Note: Refer to Installation Instructions supplied with encoder for additional information.

Specifications

Single Incremental Encoder

Table F.A Single Incremental Encoder Specifications

Consideration	Description
Input	Differential or Single Ended operation, Constant Current Sink operation ~10 mA 5V DC minimum to 15V DC maximum sourcing 10 mA minimum high state voltage of 3.5V DC maximum low state voltage of 0.4V DC
Maximum Cable Length	30 m (100 ft) @ 5V, 183 m (600 ft) @ 12V
Maximum Input Frequency	250 kHz

Table F.B TB1 Terminal Designations

Terminal	Name	Description
Sd	Shield	Terminating point for wire shields when an EMC plate or conduit box is not installed.
12	+12 Volt DC Power	Power supply for encoder 250 mA.
Com	Common	+12V and +5V Common
5	+5 Volt DC Power	Power supply for encoder 250 mA.
A	Encoder A	Single channel or quadrature A input.
A-	Encoder A (NOT)	
B	Encoder B	Quadrature B input.
B-	Encoder B (NOT)	
Z	Encoder Z	Pulse, marker or registration input.
Z-	Encoder Z (NOT)	
+24	+24 Volt	Power source for homing input.
24C	Common	
HmC	Homing Input Common	Captures the AB edge counter.
Hm	Homing Input	

Parameter Access

Refer to [Select A Device on page D-5](#) for instructions on how to access parameters on an option module.

Parameter Descriptions

Single Incremental Encoder option module parameter descriptions begin on page [page 3-159](#).

Dual Incremental Encoder

Table F.C Dual Incremental Encoder Jumper Settings

Jumper	Enabled Position	Storage Position
P3 - Safety Jumper Enables use with speed monitoring safety option (20-750-S1).		
P4 - 12V Jumper Enables use with 12 volt supply in "Enabled" position and 5 volt supply in "Storage" position.		

Table F.D Dual Incremental Encoder Specifications

Consideration	Description
Input	Differential or Single Ended operation, Constant Current Sink operation ~10 mA 5V DC minimum to 15V DC maximum sourcing 10 mA minimum high state voltage of 3.5V DC maximum low state voltage of 0.4V DC
Maximum Cable Length	30 m (100 ft) @ 5V, 183 m (600 ft) @ 12V
Maximum Input Frequency	250 kHz

Table F.E Dual Incremental Encoder Terminal Designations

Terminal	Name	Description
ES	+12 or +5 Volt DC Power	Power supply for Encoder 0, 250 mA.
EC	Common	+12V and +5V Encoder 0, common
0A	Encoder 0: A	Single channel or quadrature A input.
0A-	Encoder 0: A (NOT)	
0B	Encoder 0: B	Quadrature B input.
0B-	Encoder 0: B (NOT)	
0Z	Encoder 0: Z	Pulse, marker or registration input.
0Z-	Encoder 0: Z (NOT)	
Sd	Encoder Shield	Terminating point for wire shields when an EMC plate or conduit box is not installed.
Sd	Encoder Shield	
ES	+12 or +5 Volt DC Power	Power supply for Encoder 1, 250 mA.
EC	Common	+12V and +5V Encoder 1, common
1A	Encoder 1: A	Single channel or quadrature A input.
1A-	Encoder 1: A (NOT)	
1B	Encoder 1: B	Quadrature B input.
1B-	Encoder 1: B (NOT)	
1Z	Encoder 1: Z	Pulse, marker or registration input.
1Z-	Encoder 1: Z (NOT)	
24	+24 Volt	Power source for homing input.
24C	Common	
Hm	Homing Input	Captures the AB edge counter.
HmC	Homing Input Common	

ES	EC

Notes:

Using DeviceLogix

Introduction

DeviceLogix (DLX) is an embedded component located in Port 14 of PowerFlex 750-Series drives. It is used to control outputs and manage status information locally within the drive. It can function stand-alone or complimentary to supervisory control.

DeviceLogix programming for PowerFlex 750-Series drives is accomplished through a DeviceLogix Editor component ( icon), which is incorporated in the following versions of drive software:

Drive Software Tool	PowerFlex 755 v1.xx	PowerFlex 753 v1.xx PowerFlex 755 v2.xx
DriveExplorer	v6.01 (and higher)	v6.02 (and higher)
DriveTools SP / DriveExecutive	v5.01 (and higher)	v5.02 (and higher)
DeviceLogix 5000 Drive Add-On Profiles	v2.01 (and higher)	v2.02 (and higher)

Only the drive software tools listed above can be used to program the DeviceLogix component in PowerFlex 750-Series drives. Other DeviceLogix Editors, such as RSNetWorx for DeviceNet, cannot be used.

Note the following feature differences between the drive firmware releases:

	PowerFlex 755 v1.xx	PowerFlex 753 v1.xx PowerFlex 755 v2.xx
DeviceLogix Library	Version 3	Version 4
Maximum number of function blocks	90	225
Program update time per number of blocks used	5 ms (fixed): 1...45 blocks 10 ms (fixed): 46...90 blocks	5 ms (fixed): 1...45 blocks 10 ms (fixed): 46...90 blocks 15 ms (fixed): 91...135 blocks 20 ms (fixed): 136...180 blocks 25 ms (fixed): 181...225 blocks

Version 3 of the DeviceLogix library introduced the following new features:

- Analog instructions (compute, math, compare, etc.)
- Multiple I/O enable line object support
- Cut and Paste capability
- Screen format retention
- Online Help / Bit tool tip

Version 4 of the DeviceLogix library added the following new features:

- Macro Block instruction – a custom function block element that contains other function blocks programmed by the user to perform a specific task(s)
- PID instruction

Note: PowerFlex 755 v1.xxx drives can be flash updated to v2.xxx to take advantage of the new features in the Version 4 release of the DeviceLogix library and the increased number of function blocks.

The PowerFlex 750-Series DeviceLogix can provide basic logic capability for applications that can allow a 5...25 ms scan time depending on program size, plus the time it takes to update the I/O. It can be used in both networked and stand-alone environments. It can also operate autonomous of the drive. For example, it can continue executing if the drive is faulted, or disconnected from AC input power (requires PowerFlex 750-Series 24 VDC auxiliary power supply option, catalog number 20-750-APS).

Parameters

The following are the DeviceLogix parameters (located in Port 14).

File	Group	No.	Name Description	Values	Read-Write	Data Type																																																	
HOST GROUPS	Analog Outputs	1 Thru 14	DLX Out 01 DLX Out 14 Fourteen floating point outputs that can be controlled by the DeviceLogix program. These are typically mapped to a parameter to write its value. It can also be mapped to the Reference Command.	Default: 0 Min/Max: 0 / 159999	RW	Real																																																	
		15 16	DLX Out 15 DLX Out 16 Two unsigned 32-bit integer outputs that can be controlled by the DeviceLogix program. These are typically mapped to a parameter to write its value.	Default: 0 Min/Max: 0 / 159999	RW	32-bit Integer																																																	
	Analog Inputs	17 Thru 30	DLX In 01 DLX In 14 Fourteen floating point inputs that can be read by the DeviceLogix program. These are typically mapped to a parameter to read its value. It can also be mapped to Common Feedback.	Default: 0 Min/Max: 0 / 159999	RW	Real																																																	
		31 32	DLX In 15 DLX In 16 Two unsigned 32-bit integer inputs that can be read by the DeviceLogix program. These are typically mapped to a parameter to read its value. It can also be mapped to Real Time Clock values.	Default: 0 Min/Max: 0 / 159999	RW	32-bit Integer																																																	
	Digital Inputs	33 Thru 48	DLX DIP 01 DLX DIP 16 Sixteen digital inputs that can be read by the DeviceLogix program. These are typically mapped to an input point in an I/O option module or to Logic Status bits.	Default: 0.00 Min/Max: 0 / 159999.15	RW	32-bit Integer																																																	
		49	DLX DigIn Sts Provides the individual on/off status of the 16 DLX DIP's. Options <table border="1"> <tr> <td></td> <td>DLX DIPVal16</td> <td>DLX DIPVal15</td> <td>DLX DIPVal14</td> <td>DLX DIPVal13</td> <td>DLX DIPVal12</td> <td>DLX DIPVal11</td> <td>DLX DIPVal10</td> <td>DLX DIPVal9</td> <td>DLX DIPVal8</td> <td>DLX DIPVal7</td> <td>DLX DIPVal6</td> <td>DLX DIPVal5</td> <td>DLX DIPVal4</td> <td>DLX DIPVal3</td> <td>DLX DIPVal2</td> <td>DLX DIPVal1</td> </tr> <tr> <td>Default</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Bit</td> <td>15</td> <td>14</td> <td>13</td> <td>12</td> <td>11</td> <td>10</td> <td>9</td> <td>8</td> <td>7</td> <td>6</td> <td>5</td> <td>4</td> <td>3</td> <td>2</td> <td>1</td> <td>0</td> </tr> </table> 0 = Condition Off 1 = Condition On		DLX DIPVal16	DLX DIPVal15	DLX DIPVal14	DLX DIPVal13	DLX DIPVal12	DLX DIPVal11	DLX DIPVal10	DLX DIPVal9	DLX DIPVal8	DLX DIPVal7	DLX DIPVal6	DLX DIPVal5	DLX DIPVal4	DLX DIPVal3	DLX DIPVal2	DLX DIPVal1	Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Function Block Elements

The following function block elements are available:

Bit and Analog I/O ⁽¹⁾	
Process	ALM TDG PID
Filter	LPF
Select/Limit	SEL HLL
Statistical	MAVE
Timer/Counter	TONR TOFR PULR CTU CTUD
Compare	MEQ EQU NEQ LES GRT LEQ GEQ
Compute/Math	ADD SUB MUL DIV MOD SQR NEG ABS XPY
Move/Logical	BAND BOR BXOR BNOT BAND BNOR BXNOR SETD RSTD
Macro Block ⁽²⁾	

(1) Bit and Analog I/O do not count against the Function Block total. All other elements count, with each instance counting as one Function Block.

(2) Macro Blocks are created by the user. The selections will be empty until a Macro Block gets created. The icon text associated with each Macro Block is also created by the user.

The DeviceLogix Editor provides a graphical interface for configuring Function Blocks to provide local control within the drive. DeviceLogix Editor navigation and programming basics is not covered in this manual. Refer to the DeviceLogix User Manual, publication RA-UM003A for additional information. It can be found on the RA Literature Library web site at: <http://www.rockwellautomation.com/literature>.

Bit and Analog I/O Points

The DeviceLogix controller in Port 14 uses (48) bit inputs, (48) bit outputs, (24) analog inputs, and (17) analog outputs to interact with the other ports in the drive (both drive and peripheral parameters).

Bit Inputs

Available bit inputs to the DeviceLogix program include:

Bit Inputs	Description
(16) Hardware Boolean Inputs <ul style="list-style-type: none"> DIP1 to DIP 16 	These correlate with DeviceLogix Port 14 parameters P33 [DLX DIP 01] to P48 [DLX DIP 16]
(32) Network Boolean Inputs <ul style="list-style-type: none"> Ready, Active, Alarm, Faulted, etc. 	These correlate with the DeviceLogix Logic Status word for the drive. Refer to page A-10 for details on the Logic Status word bits.

Bit inputs are used to connect to real-world input devices (push buttons, photoeyes, etc.) that are wired to an I/O option module in the drive, monitor drive status, or to read a bit in a bit-enumerated parameter.

Bit Outputs

Available bit outputs from the DeviceLogix program include:

Bit Outputs	Description
(16) Hardware Boolean Outputs <ul style="list-style-type: none"> • DOP1 to DOP 16 	These correlate with the bits in DeviceLogix Port 14 parameter P51 [DLX DigOut Sts2]
(32) Network Boolean Outputs <ul style="list-style-type: none"> • Stop, Start, Jog1, Clear Faults, etc. 	These correlate with the DeviceLogix Logic Command word for the drive. Refer to page A-9 for details on the Logic Command word bits. These bits can also be monitored in DeviceLogix Port 14 parameter P50 [DLX DigOut Sts].

Bit Outputs are used to connect to real-world output devices (pilot lights, relays, etc.) that are wired to an I/O option module in the drive, to directly control the drive via Logic Command bits, or to write a bit in a bit-enumerated parameter.

Analog Inputs

Available analog inputs to the DeviceLogix program include:

Analog Inputs	Description
(12) Hardware Analog Inputs <ul style="list-style-type: none"> • DLX Real InSP1 to DLX Real InSP8 (Real) • DLX DINT InSP1 to DLX DINT InSP4 (DINT) 	Scratchpad registers for DLX program input use.
(17) Network Analog Inputs <ul style="list-style-type: none"> • Common Feedback (Real) • DLX In 01 to DLX In 14 (Real) • DLX In 15 to DLX In 16 (DINT) 	The Common Feedback correlates with the Feedback word for the drive. The DLX In's correlate with DeviceLogix Port 14 parameters P17 [DLX In 01] to Pr.32 [DLX In 16]
(7) Miscellaneous Analog Inputs <ul style="list-style-type: none"> • Real Time Clock data 	Year, Month, Day, DayofWeek, Hour, Minute, and Second from the Real Time Clock in the drive

Analog Inputs are typically used to connect to real-world input devices (sensor, potentiometer, etc.) that are wired to an I/O option module in the drive, monitor drive Feedback, read the real Time Clock, or to read a drive / peripheral parameter.

Note: Hardware Analog Inputs are available in the PowerFlex 753 and v2.xxx (and higher) PowerFlex 755 drives.

Analog Outputs

Available analog outputs from the DeviceLogix program include:

Analog Outputs	Description
(12) Hardware Analog Outputs <ul style="list-style-type: none"> • DLX Real OutSP1 to DLX Real OutSP8 (Real) • DLX DINT OutSP1 to DLX DINT OutSP4 (DINT) 	Scratchpad registers for DLX program output use.
(17) Network Analog Outputs <ul style="list-style-type: none"> • Reference Command (Real) • DLX Out 01 to DLX Out 14 (Real) • DLX Out 15 to DLX Out 16 (DINT) 	The Reference Command correlates with the Reference word for the drive. The DLX Out's correlate with DeviceLogix Port 14 parameters P1 [DLX Out 01] to Pr.16 [DLX Out 16]

Analog Outputs are typically used to connect to real-world output devices (meter panel, valve, etc.) that are wired to an I/O option module in the drive, control the Reference to the drive, or to write a drive / peripheral parameter.

Note: Hardware Analog Outputs are available in the PowerFlex 753 and v2.xxx (and higher) PowerFlex 755 drives.

Tips

Data types

Note that different data types are supported by the DeviceLogix Analog In/ Out parameters. For example, P17 [DLX In 01] is a Real whereas P32 [DLX In 16] is a DINT. Be sure to assign a DLX In / Out to a parameter that has the same data type.

Function Block elements also support different data types. Click on the Properties Button  in the upper right-hand corner of each element to display the Function Block's properties. The Function Data Type field displays the supported data types. Note that if Real DLX Ins are used with a Function Block element configured for DINT (typical default), the fraction will be truncated.

PowerFlex 755 v1.xxx Firmware

Datalinks and internal DeviceLogix scratchpad registers (P54...P81)

DLX In's and DLX Out's are Datalinks and can not be directly mapped to each other or another Datalink, such as a Datalink in the Port 13 Embedded Ethernet. Use the DeviceLogix internal scratchpad registers to pass data between the Datalinks.

Example 1 – Reading data from the network

A value from the network is input to DLX Real SP 1.

N:P.P.#	Name	Value
[11: 13.1]	DL From Net 01	Port 14: DLX Real SP1

DLX Real SP1 is read by DLX In 01 and can now be used as an Analog Input in the DeviceLogix program.

N:P.P.#	Name	Value
[11: 14.17]	DLX In 01	Port 14: DLX Real SP1

DLX Real SP1 is the intermediary register that allows the two Datalinks to work together.

Example 2 – Writing data to the network

The DeviceLogix program controls an Analog Output value in DLX Out 01 which is written to DLX Real SP2.

N:P.P.#	Name	Value
[11: 14.1]	DLX Out 01	Port 14: DLX Real SP2

The DLX Real SP2 value is output to the network.

N:P.P.#	Name	Value
[11: 13.17]	DL To Net 01	Port 14: DLX Real SP2

DLX Real SP2 is the intermediary register that allows the two Datalinks to work together.

**PowerFlex 753 (all) and PowerFlex 755 v2.xxx (and higher)
Datalinks and internal DeviceLogix scratchpad registers (P82...P105)**

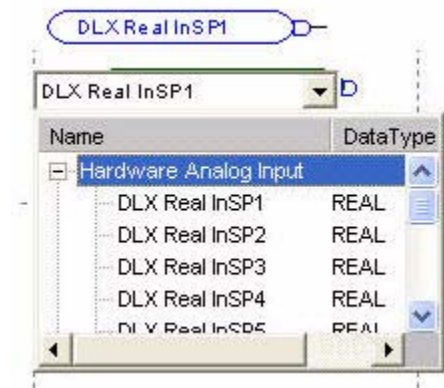

DLX In's and DLX Out's are Datalinks and can not be directly mapped to each other or another Datalink, such as a Datalink in the Port 13 Embedded Ethernet. Although the same method used with PowerFlex 755 v1.xxx firmware can be employed, there is a more efficient method that does not require a DeviceLogix Datalink to be used.

Example 1 – Reading data from the network

A value from the network is input to DLX Real InSP1.

Drive	Datalink	Value
753	Port 0 P895 [Data In A1]	Port 14: DLX Real InSP1
755	Port 13 P1 [DL From Net 01]	

DLX Real InSP1 can now be used as a Hardware Analog Input and used directly with a Function Block (a DeviceLogix Datalink is not required).

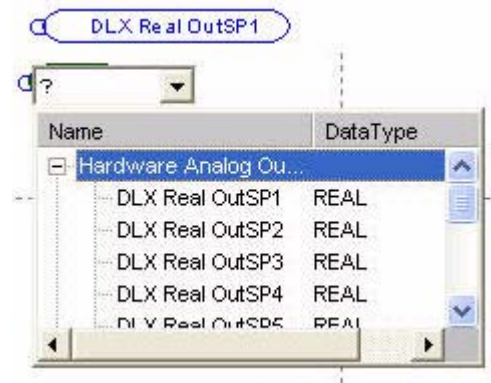

Example 2 – Writing data to the network

The DeviceLogix program controls an Analog Output value which is written to DLX Real OutSP1.

Drive	Datalink	Value
753	Port 0 P905 [Data Out A1]	Port 14: DLX Real OutSP1
755	Port 13 P17 [DL To Net 01]	

DLX Real OutSP1 can now be used as a Hardware Analog Output and used directly with a Function Block (a DeviceLogix Datalink is not required).

Program Examples

Example 1: Selector Switch Operation

This example demonstrates how a selector switch operation similar to the feature in the PowerFlex 700S can be achieved through the embedded DeviceLogix in the PowerFlex 750-Series drive. A Selector switch is simulated in the drive using a combination of inputs to produce multiple outputs. Digital inputs in the drive are used to output configurable multiple preset speeds (75 Hz, 85Hz, 95Hz, and 105Hz) to P571 [Preset Speed 1]. It is assumed that the 750-Series drive has an I/O module installed in Port 4.

The truth table below represents the inputs and outputs for a 4 position selector switch.

Inputs		Outputs	
Input 1	Input 2	Binary Output	Selector Switch Output
0	0	0	Output A
0	1	1	Output B
1	0	2	Output C
1	1	3	Output D

The Logic Map below offers a high level explanation of how the above outputs are achieved.

Figure G.1 Two Input Four Position Selector Switch Logic Map

Discrete Inputs in the Drive are used for Inputs 1 and Input 2. Output A, B, C, and D are linked to DeviceLogix Scratchpad Registers. This allows further flexibility to modify the values of these outputs.

The resulting output can be linked to a parameter and used in supporting drive applications, such as configuring multiple preset speeds, point to point positioning, etc. In this example, it controls Preset Speed 1.

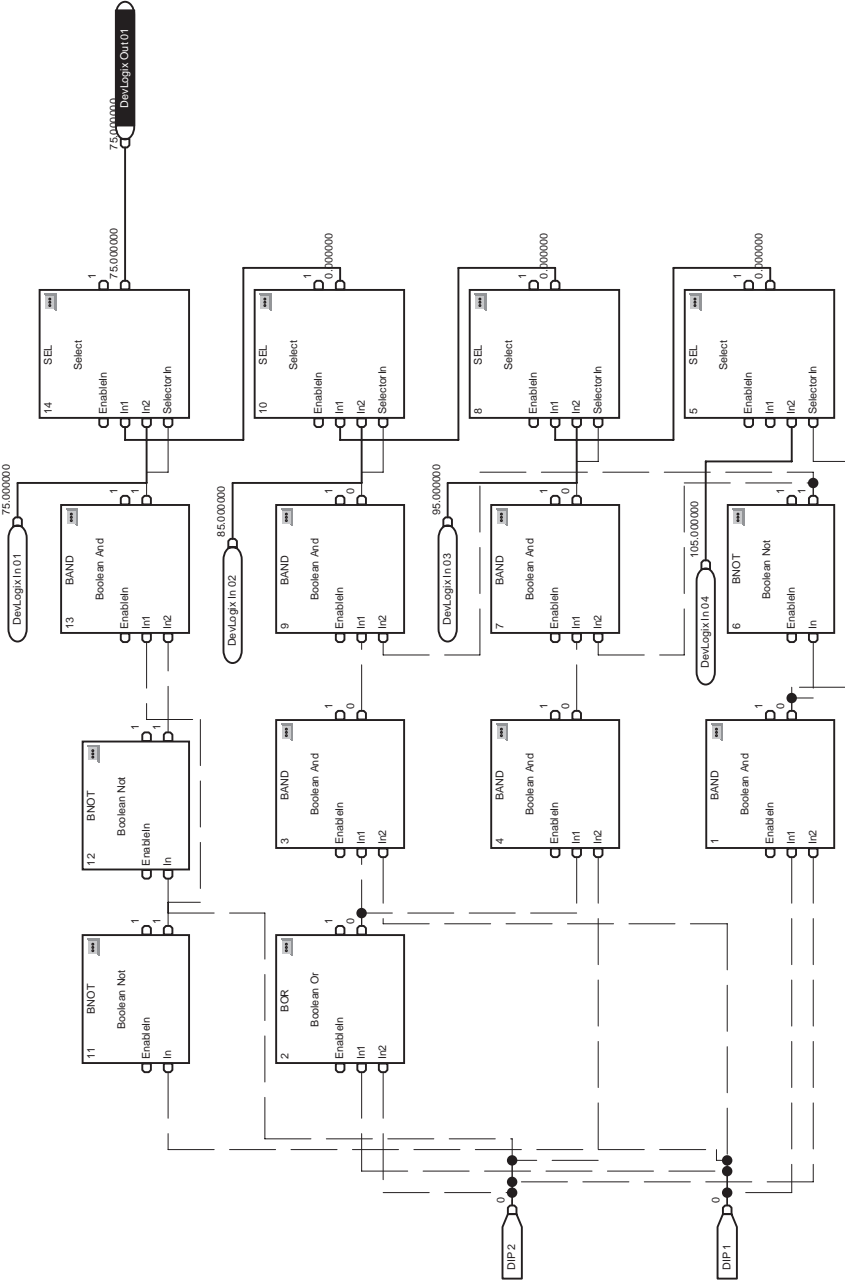

Parameter Configuration

The following parameters are configured for this example:

Port Parameter No.	Parameter	Value	Description
14.1	DLX Out 01	Port 0:Preset Speed 1	
14.33	DLX DIP 1	Port 4: Dig In Status.Input 1	Digital input 1 from Selector Switch
14.34	DLX DIP 2	Port 4: Dig In Status.Input 2	Digital input 2 from Selector Switch
14.17	DLX In 01	Port 14: DLX Real SP1	Output A
14.18	DLX In 02	Port 14: DLX Real SP2	Output B
14.19	DLX In 03	Port 14: DLX Real SP3	Output C
14.20	DLX In 04	Port 14: DLX Real SP4	Output D
14.54	DLX Real SP1	75.00	Output A Preset Speed
14.55	DLX Real SP2	85.00	Output B Preset Speed
14.56	DLX Real SP3	95.00	Output C Preset Speed
14.57	DLX Real SP4	105.00	Output D Preset Speed
0.571	Preset Speed 1	varies	Resulting output from Selector Switch

Functional Block Programming

The Selector Switch Operation example consists of 14 blocks that are shown below.

Example 2: Scale Block Operation

This example demonstrates how a scale block operation similar to the feature in the PowerFlex 700VC can be achieved through the embedded DeviceLogix in the PowerFlex 750-Series drive. A Scale Block scales a parameter value and the input of the block is linked to a parameter that is desired to be scaled. The scale block also has both input and output high limits and low limit parameters.

Figure G.2 Scale Block High Level View

Scale In Hi determines the high value for the input to the scale block.

Scale Out Hi determines the corresponding high value for the output of the scale block.

Scale In Low determines the low value for the input to the scale block.

Scale Out Lo determines the corresponding low value for the output of the scale block.

Scale Out Value of the block is then available for user to link to any parameter that accepts links.

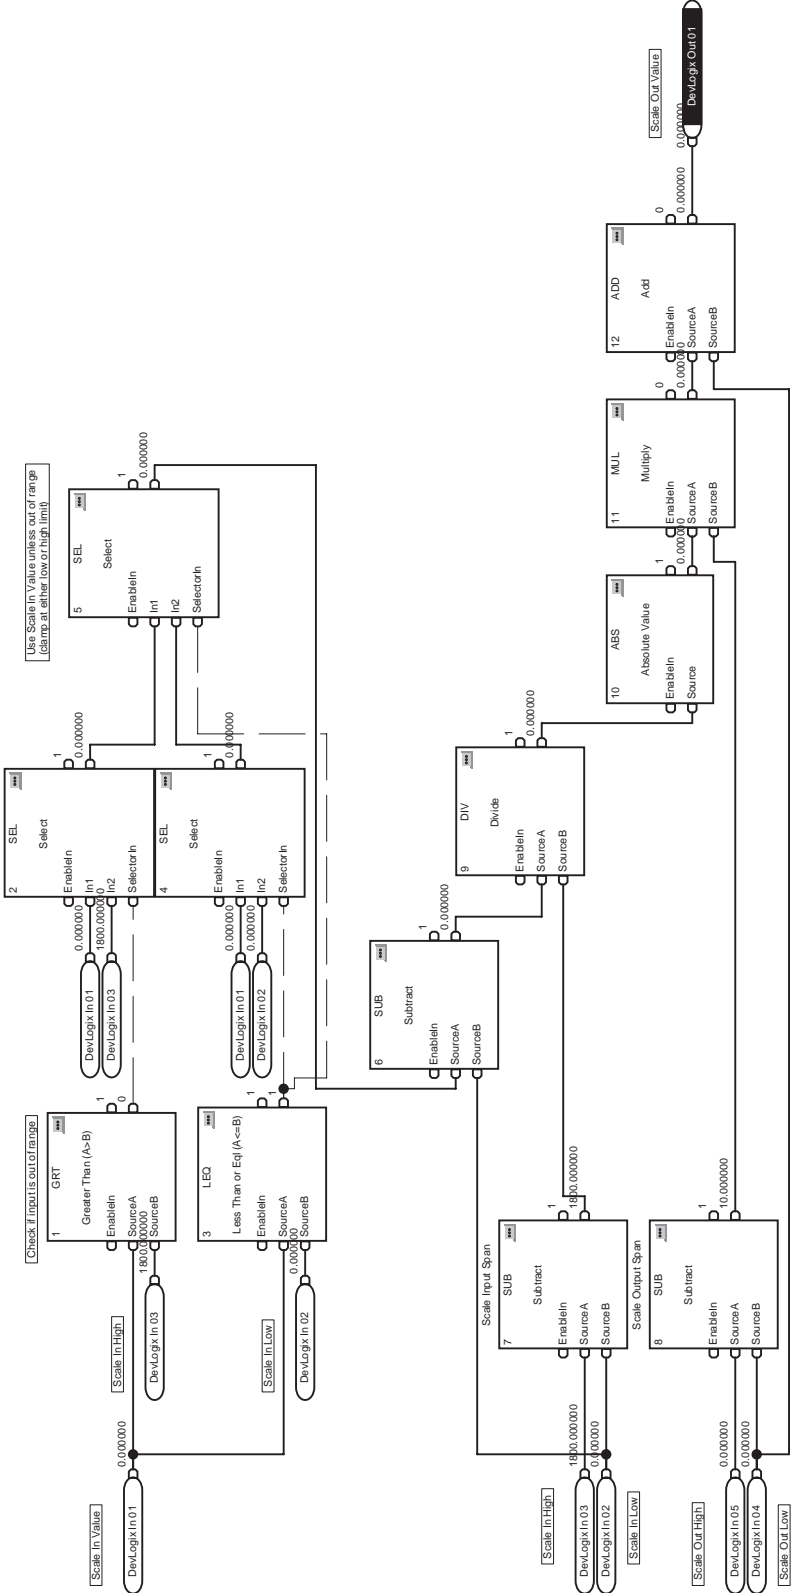

Parameter Configuration

The following DeviceLogix parameters are configured for this example:

Port Parameter No.	Parameter	Value	Description
14.1	DLX Out 01	* Set this to where the Scale Output value should go *	
14.17	DLX In 01	* Set this to your Scale Input value source *	
14.18	DLX In 02	Port 14: DLX Real SP2	Scale In Low
14.19	DLX In 03	Port 14: DLX Real SP3	Scale In High
14.20	DLX In 04	Port 14: DLX Real SP4	Scale Out Low
14.21	DLX In 05	Port 14: DLX Real SP5	Scale Out High
14.55	DLX Real SP2	0.0	Scale In Low value
14.56	DLX Real SP3	1800.00	Scale In High value
14.57	DLX Real SP4	0.000	Scale Out Low value
14.58	DLX Real SP5	10.00	Scale Out High value

Functional Block Programming

The Scale Block Operation example consists of 12 blocks that are shown below.

Example 3: Diverter Operation

This example demonstrates basic control logic to operate a diverter in a conveyor system. The diverter directs parts from an upstream conveyor to one of two downstream conveyors. It alternately sends 'x' parts down each downstream conveyor.

The application consists of the following discrete I/O:

Type	Name	Description
Inputs	Part Present Sensor	Identifies that a part is present
Outputs	Diverter Actuator	Controls the diverter actuator to direct the flow of parts

Example logic requirements:

- If Part Present Sensor is ON, then increment the parts counter
- If parts counter preset is reached, reset the counter and alternately set or reset the Diverter Actuator

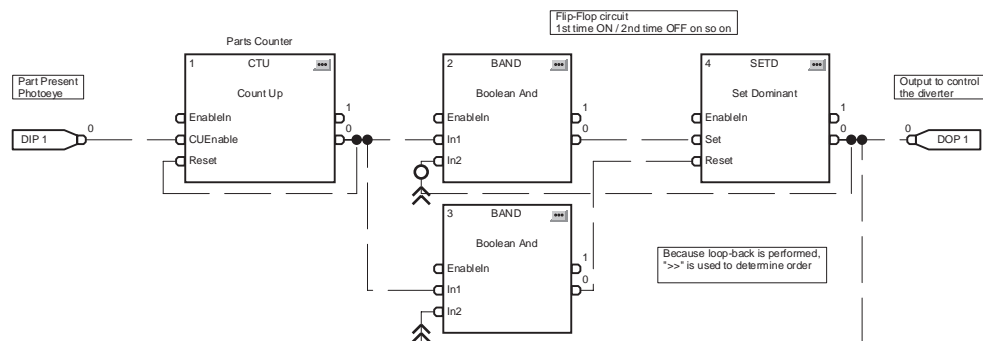

Parameter Configuration

The following parameters are configured for this example:

Port Parameter No.	Parameter	Value	Description
4.20	TO0 Select	Port 14: DLX DigOut Sts2.DLX DOPSts0	Output on I/O module in Port 4
14.33	DLX DIP 1	Port 4: Dig In Status.Input 1	Part Present Sensor input (I/O module in Port 4)
14.51	DLX DigOut Sts2		Diverter Actuator output

Functional Block Programming

This example consists of 4 blocks that are shown below.

Example 4: Wet Well Operation

This example demonstrates how basic control logic can be used for simple applications. It is assumed that the PowerFlex 755 has an I/O module installed in Port 4.

Figure G.3 Wet Well

The application consists of the following discrete I/O:

Type	Name	Description
Inputs	Fault Reset pushbutton	Used to reset any faults or alarms
	Critical High Level sensor	Indicates a critically high level. It is normally a backup to the High Level sensor and is also used to detect if the High Level sensor is faulty. When ON, the drive will operate at an even higher output frequency in case it is due to a high inflow.
	High Level sensor	Indicates the well is at a high level and it is time to start pumping (normal operation). The drive operates at a 'normal' rate unless the Critical High Level was reached.
	Low Level sensor	When OFF, it is used to indicate that the well is empty (as long as the High and Critical High Level sensors are also OFF). The drive stops operating (end of pumping cycle).
Outputs	Sensor Fault pilot light	Indicates that there is a problem with either the High Level or Low Level sensors
	Too Much Time Alarm pilot light	If the drive operates for more than the normal amount of time it takes to empty the well, there may be increased inflow or perhaps the Low Level sensor is stuck ON. An alarm indication is made and the drive continues to operate.
	Critical High Fault flashing light / alarm horn	Indicates a critically high level that requires immediate attention.

Example logic requirements:

- If Critical High Level or High Level sensor is ON, then start the drive.
 - If Critical High Level sensor is ON, then switch to higher rate (90Hz) for the rest of the pumping cycle. Else run at the normal rate (60Hz)
 - Run until all three level sensors are OFF
 - Pump should run at least ‘x’ minutes at a minimum. If the Low Level sensor fails, this prevents the High Level sensor from cycling the pump On/Off too quickly.
- Annunciate a Sensor Fault condition
 - The Low Level sensor should never be OFF when either the High Level or Critical High Level sensors are ON
 - The High Level sensor should never be OFF when the Critical High Level sensor is ON
 - The Critical High Level sensor should never be ON when either the High Level or Low Level sensors are OFF
- Annunciate a Critical High Level condition
 - The Critical High Level output should never be ON
- Annunciate if pumping cycle time is longer than normal (‘y’ minutes)
 - Monitor the amount of time a pump cycle takes by timing how long the drive is operating.
 - If greater than ‘y’ minutes, energize the Too Much Time Alarm output
- Reset alarms / faults with a Reset pushbutton input

Parameter Configuration

The following parameters are configured for this example.

The following DeviceLogix parameters are configured for this example:

Port Parameter No.	Parameter	Value	Description
0.520	Max Fwd Speed	90.00	
0.545	Speed Ref A Sel	Port 0: Preset Speed 1	
0.571	Preset Speed 1	60.00	Normal pumping rate (60Hz)
0.573	Preset Speed 3	90.00	High speed pumping rate (90Hz)
4.10	RO0 Select	Port 14: DLX DigOut Sts2.DLX DOPSts0	Sensor Fault output
4.20	TO0 Select	Port 14: DLX DigOut Sts2.DLX DOPSts1	Critical High Level Fault output
4.30	TO1 Select	Port 14: DLX DigOut Sts2.DLX DOPSts2	Too Much Time Alarm output
14.33	DLX DIP 1	Port 4: Dig In Status.Input 1	Critical High Level Sensor input
14.34	DLX DIP 2	Port 4: Dig In Status.Input 2	High Level Sensor input
14.35	DLX DIP 3	Port 4: Dig In Status.Input 3	Low Level Sensor input
14.36	DLX DIP 4	Port 4: Dig In Status.Input 4	Alarm / Fault Reset pushbutton input

Functional Block Programming

This example consists of 16 blocks that are shown below.

Figure G.4 Control Circuit

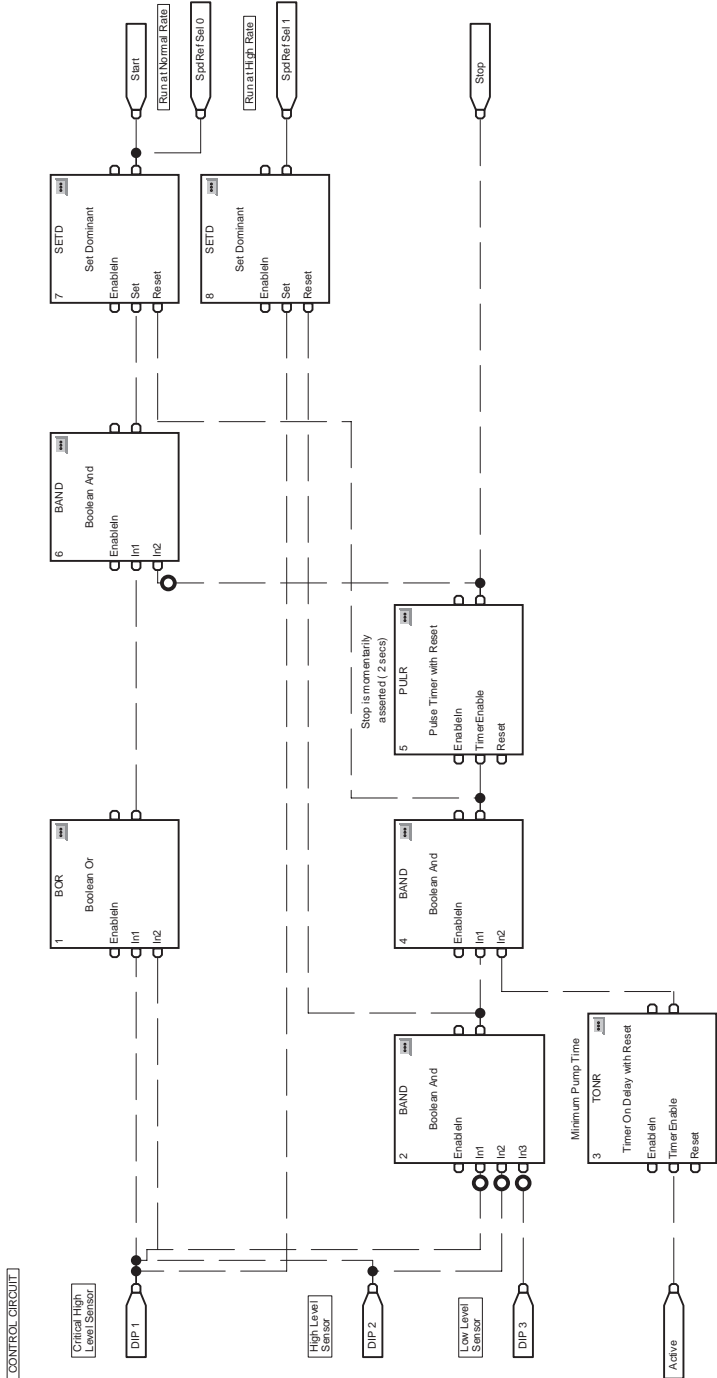

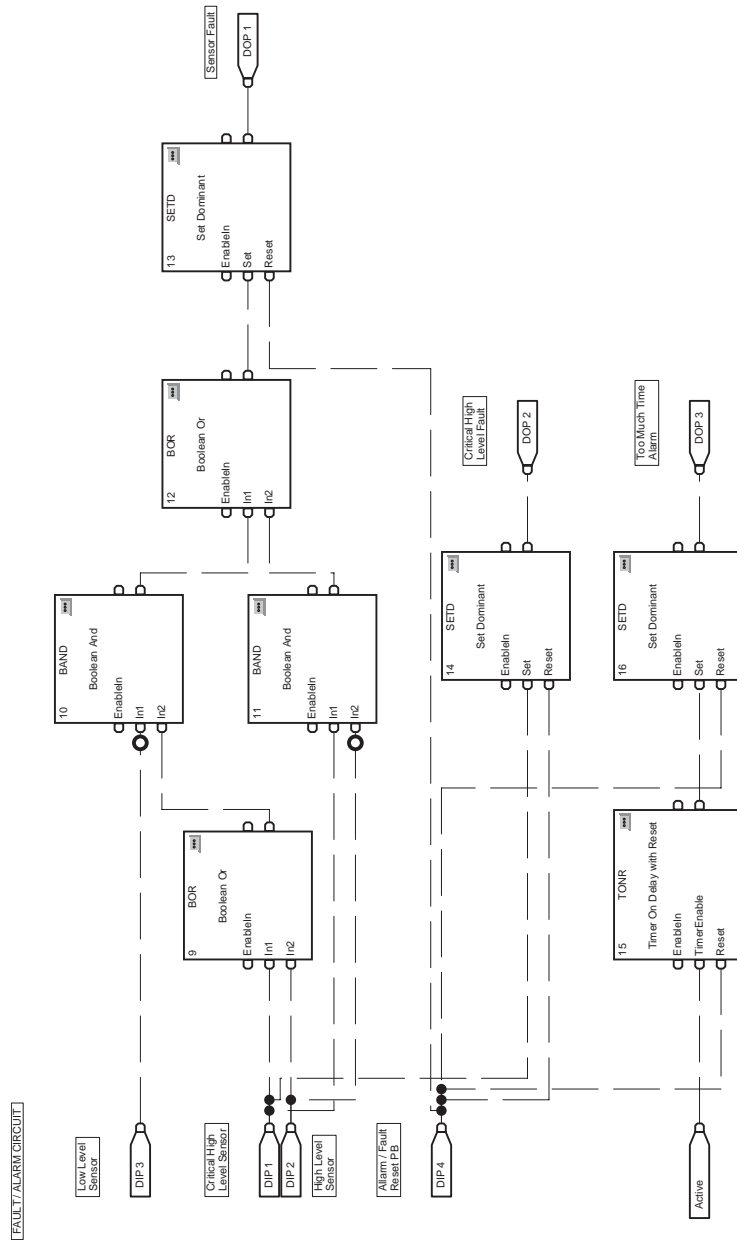

Figure G.5 Fault/Alarm Circuit

Example 5: Utilizing the Real Time Clock

This example demonstrates how to utilize the PowerFlex 750-Series drive Real Time Clock in a DeviceLogix program.

Example logic requirements:

- Run the drive Monday through Friday between 7:45AM and 5:15PM

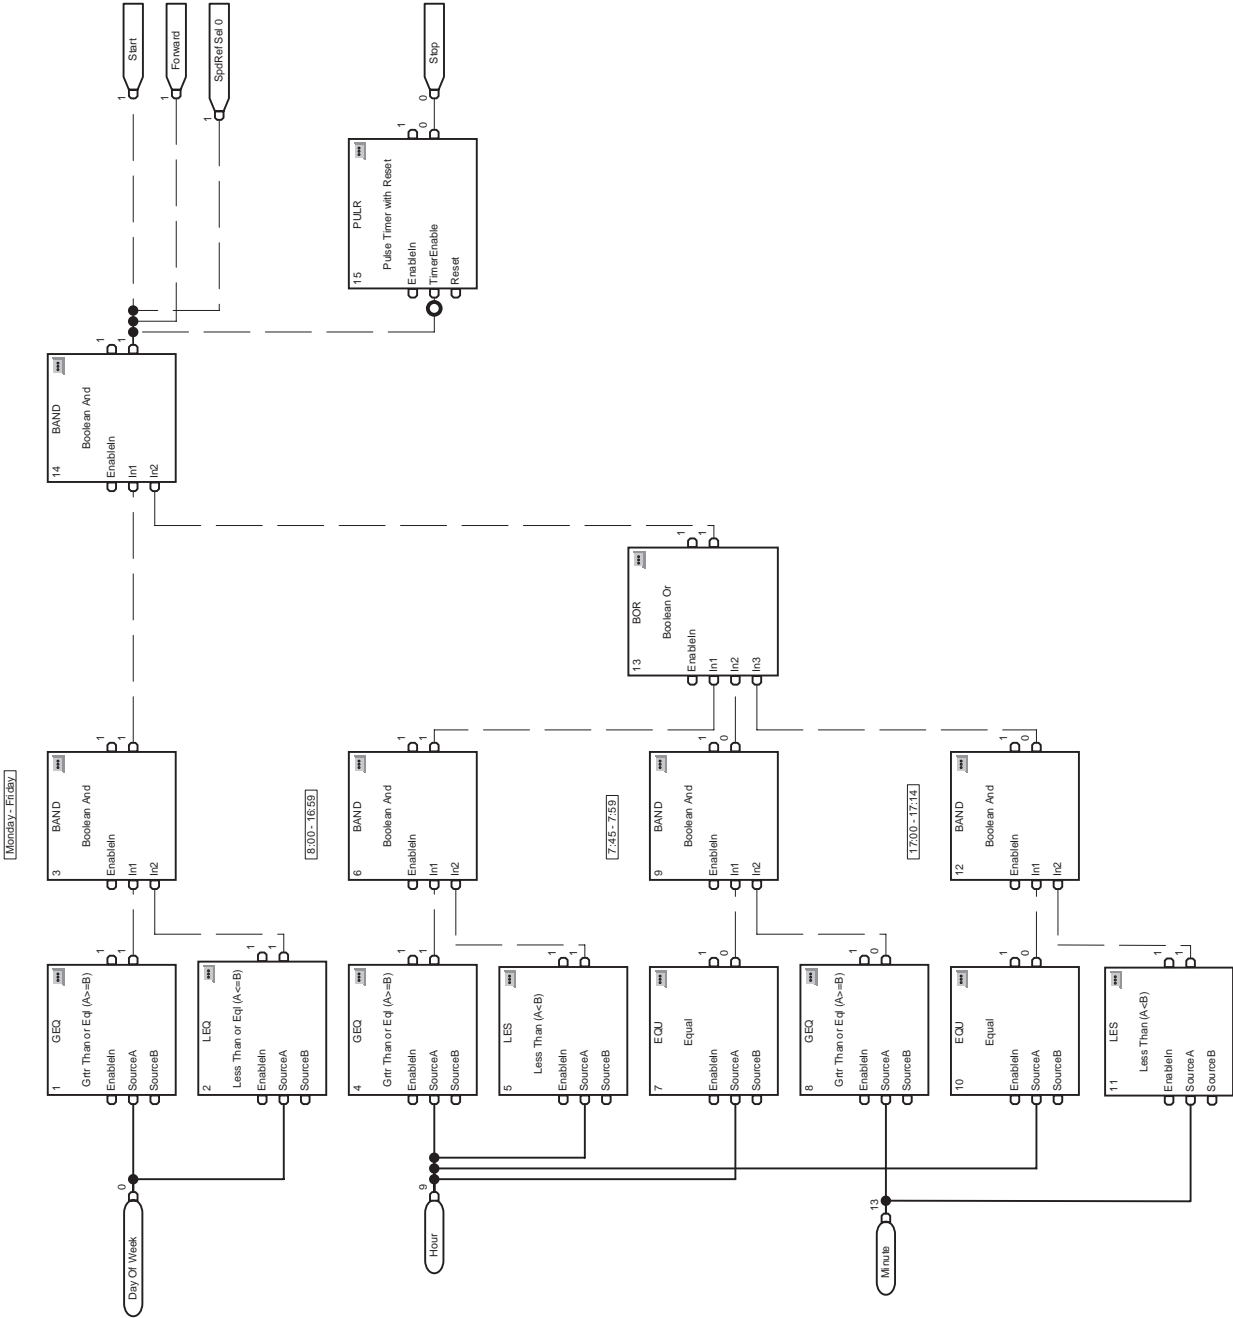

Parameter Configuration

The following parameters are configured for this example:

Port Parameter No.	Parameter	Value	Description
0.545	Speed Ref A Sel	Port 0: Preset Speed 1	
0.571	Preset Speed 1	60.00	Operating speed of drive

Functional Block Programming

This example consists of 15 blocks that are shown below.

Notes:

Permanent Magnet Motors

Compatible Allen-Bradley Servo Motors

The following table contains a list of specifications for Allen-Bradley servo motors compatible with PowerFlex 750-Series drives. This list primarily includes 460V rated MP and 1326 Series Allen-Bradley servo motors. This information is provided to help configure PowerFlex 750-Series drive with the appropriate servo motor data. For information regarding compatibility and configuration of any Allen-Bradley servo motors and third party PM motors not listed here, contact Allen-Bradley Drives Technical Support.
