Altivar 32

Variable speed drives
for synchronous and asynchronous motors

Programming Manual

07/2014

Schneider Electric

The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. If you have any suggestions for improvements or amendments or have found errors in this publication, please notify us.

No part of this document may be reproduced in any form or by any means, electronic or mechanical, including photocopying, without express written permission of Schneider Electric.

All pertinent state, regional, and local safety regulations must be observed when installing and using this product. For reasons of safety and to help ensure compliance with documented system data, only the manufacturer should perform repairs to components.

When devices are used for applications with technical safety requirements, the relevant instructions must be followed.

Failure to use Schneider Electric software or approved software with our hardware products may result in injury, harm, or improper operating results.

Failure to observe this information can result in injury or equipment damage.

Table of Contents

Safety Information

Important Information

NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a Danger or Warning safety label indicates that an electrical hazard exists, which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

⚠ DANGER

DANGER indicates an imminently hazardous situation, which, if not avoided, **will result** in death or serious injury.

⚠ WARNING

WARNING indicates a potentially hazardous situation, which, if not avoided, **can result** in death, serious injury, or equipment damage.

⚠ CAUTION

CAUTION indicates a potentially hazardous situation, which, if not avoided, **can result** in injury or equipment damage.

NOTICE

NOTICE, used without the safety alert symbol, indicates a potentially hazardous situation which, if not avoided, **can result** in equipment damage.

PLEASE NOTE

The word "drive" as used in this manual refers to the controller portion of the adjustable speed drive as defined by NEC.

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this product.

About the Book
At a Glance

Document scope

The purpose of this document is to:

- help you to set-up the drive,
- show you how to program the drive,
- show you the different menus, modes and parameters,
- help you in maintenance and diagnostics.

Validity note

This documentation is valid for the Altivar 32 drive.

Product related information

⚠ ⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation and who have received safety training to recognize and avoid hazards involved are authorized to work on and with this drive system. Installation, adjustment, repair, and maintenance must be performed by qualified personnel.
- The system integrator is responsible for compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
- Many components of the product, including the printed circuit boards, operate with mains voltage. Do not touch. Use only electrically insulated tools.
- Do not touch unshielded components or terminals with voltage present.
- Motors can generate voltage when the shaft is rotated. Before performing any type of work on the drive system, block the motor shaft to prevent rotation.
- AC voltage can couple voltage to unused conductors in the motor cable. Insulate both ends of unused conductors of the motor cable.
- Do not short across the DC bus terminals or the DC bus capacitors or the braking resistor terminals.
- Before performing work on the drive system:
  - Disconnect all power, including external control power that may be present.
  - Place a "Do Not Turn On" label on all power switches.
  - Lock all power switches in the open position.
  - Wait 15minutes to allow the DC bus capacitors to discharge. The DC bus LED is not an indicator of the absence of DC bus voltage that can exceed 800Vdc.
  - Measure the voltage on the DC bus between the DC bus terminals using a properly rated voltmeter to verify that the voltage is < 42Vdc.
  - If the DC bus capacitors do not discharge properly, contact your local Schneider Electric representative.
- Install and close all covers before applying voltage.

Failure to follow these instructions will result in death or serious injury.

⚠ DANGER

UNINTENDED EQUIPMENT OPERATION

- Read and understand this manual before installing or operating the Altivar 32 drive.
- Any changes made to the parameter settings must be performed by qualified personnel.

Failure to follow these instructions will result in death or serious injury.

⚠ WARNING

DAMAGE DRIVE EQUIPMENT

Do not operate or install any drive or drive accessory that appears damaged.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

⚠ WARNING

LOSS OF CONTROL

- The designer of any control scheme must consider the potential failure modes of control paths and, for critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop, overtravel stop, power outage, and restart.
- Separate or redundant control paths must be provided for critical control functions.
- System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- Observe all accident prevention regulations and local safety guidelines.[1]
- Each implementation of the product must be individually and thoroughly tested for proper operation before being placed into service.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

1. For USA: Additional information, refer to NEMA ICS 1.1 (latest edition), "Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control" and to NEMA ICS 7.1 (latest edition), "Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable Speed Drive Systems."

⚠ CAUTION

INCOMPATIBLE LINE VOLTAGE

Before turning on and configuring the drive, ensure that the line voltage is compatible with the supply voltage range shown on the drive nameplate. The drive may be damaged if the line voltage is not compatible.

Failure to follow these instructions can result in injury or equipment damage.

CAUTION

RISK OF DERATED PERFORMANCE DUE TO CAPACITOR AGING

The product capacitor performances after a long time storage above 2 years can be degraded.
In that case, before using the product, apply the following procedure:

- Use a variable AC supply connected between L1 and L2 (even for ATV32●●●N4 references).
- Increase AC supply voltage to have:
  - 80% of rated voltage during 30 min
  - 100% of rated voltage for another 30 min

Failure to follow these instructions can result in equipment damage.

User comments

The word "drive" as used in this manual refers to the controller portion of the adjustable speed drive as defined by NEC.

Standards and Terminology

The technical terms, terminology, and the corresponding descriptions in this manual normally use the terms or definitions in the relevant standards.

In the area of drive systems this includes, but is not limited to, terms such as error, error message, failure, fault, fault reset, protection, safe state, safety function, warning, warning message, and so on.

Among others, these standards include:

- IEC 61800 series: Adjustable speed electrical power drive systems
- IEC 61508 Ed.2 series: Functional safety of electrical/electronic/programmable electronic safety-related
- EN 954-1 Safety of machinery - Safety related parts of control systems
- EN ISO 13849-1 & 2 Safety of machinery - Safety related parts of control systems.
- IEC 60204-1: Safety of machinery - Electrical equipment of machines – Part 1: General requirements

General Overview
I

What's in this Part?

This part contains the following chapters:

Software enhancements

1

What's in this Chapter?

This chapter contains the following topics:

Software enhancements

Since it was first marketed, the Altivar ATV 32 has been equipped with additional functions. Software version V2.1 IE 15 has now been updated to V2.3 IE 17. This documentation relates to version V2.3 IE 17.

The software version appears on the rating plate attached to the side of the drive.

Enhancements made to version V1.8 IE 11 in comparison to V1.5 IE 08

Added specification for hoisting application with the speed monitoring module VW3A3620.

New Functions and parameters

(*5dd-*) [ENCODER FAULT] function page 260:

- ($\mathit{r\ I\ F}$) [Enable Relay1 fallback] see page 136
- ($\mathit{r\ 2\ F}$) [Enable Relay2 fallback] see page 136

Overview

3

What's in this Chapter?

This chapter contains the following topics:

Factory configuration

Factory settings

The Altivar 32 is factory-set for common operating conditions:
- Display: drive ready **[Ready]** (⌐ ⌐ ⅃) when motor is ready to run and motor frequency when motor is running.
- The LI3 to LI6 logic inputs, AI2 and AI3 analog inputs, LO1 logic output, AO1 analog output, and R2 relay are unassigned.
- Stop mode when fault detected: freewheel.

Code	Description	Factory settings values	Page
b F ⌐	**[Standard mot. freq]**	**[50Hz IEC]**	84
t C C	**[2/3 wire control]**	**[2 wire]** (2 C): 2-wire control	83
C t t	**[Motor control type]**	**[Standard]** (5 t d): standard motor law	102
A C C	**[Acceleration]**	3.0 seconds	85
d E C	**[Deceleration]**	3.0 seconds	85
L 5 P	**[Low speed]**	0 Hz	85
H 5 P	**[High speed]**	50 Hz	85
I t H	**[Mot. therm. current]**	Nominal motor current (value depending on drive rating)	85
5 d C 1	**[Auto DC inj. level 1]**	0.7 x nominal drive current, for 0.5 seconds	91
5 F ⌐	**[Switching freq.]**	4 kHz	92
F ⌐ d	**[Forward]**	**[LI1]** (L I 1): Logic input LI1	123
⌐ ⌐ 5	**[Reverse assign.]**	**[LI2]** (L I 2): Logic input LI2	123
F ⌐ 1	**[Ref.1 channel]**	**[AI1]** (A I 1): Analog input AI1	151
⌐ 1	**[R1 Assignment]**	**[No drive flt]** (F L t): The contact opens when a fault is detected or when the drive has been switched off	135
b ⌐ A	**[Dec ramp adapt.]**	**[Yes]** (ﾘ E 5): Function active (automatic adaptation of deceleration ramp)	169
A t ⌐	**[Automatic restart]**	**[No]** (⌐ ロ): Function inactive	249
5 t t	**[Type of stop]**	**[Ramp stop]** (⌐ ⊓ P): On ramp	170
C F G	**[Macro configuration]**	**[Start/Stop]** (5 t 5)	80

Note: If you want to keep the drive presettings to a minimum, select the macro configuration
[Macro configuration] (C F G) = **[Start/stop]** (5 t 5) followed by
[Restore config.] (F C 5) = **[Config. CFG]** (I ⌐ 1). For more information, see page 80.

Check whether the values above are compatible with the application.

Application functions

The tables on the following pages show the combinations of functions and applications, in order to guide your selection.

The applications in these tables relate to the following machines, in particular:

- **Hoisting**: cranes, overhead cranes, gantries (vertical hoisting, translation, slewing), lifting platforms
- **Handling**: palletizers/depalletizers, conveyors, roller tables
- **Packing**: carton packers, labeling machines
- **Textiles**: weaving looms, carding frames, washing machines, spinners, drawing frames
- **Wood**: automatic lathes, saws, milling
- **Process**

Each machine has its own special features, and the combinations listed here are neither mandatory nor exhaustive.

Some functions are designed specifically for a particular application. In this case, the application is identified by a tab in the margin on the relevant programming pages.

Motor control functions

Functions	Page	Applications					
		Hoisting	Handling	Packing	Textiles	Wood	Process
V/f ratio	102		■			■	
Sensorless flux vector control	102	■	■	■	■	■	■
2-point vector control	102	■			■		
Open-loop synchronous motor	102				■

Basic functions

Drive ventilation

The fan starts automatically when the drive thermal state reaches 70% of the maximum thermal state and if the **[Fan Mode]** (FFN) is set to **[Standard]** ($5td$).

Graphic display terminal option

Description of the graphic display terminal

With the graphic display terminal, which works with FLASH V1.1IE26 or higher, it is possible to display more detailed information than can be shown on the integrated display terminal.

1 Graphic display

2 Function keys F1, F2, F3, F4, see page 154

3 STOP/RESET key

4 RUN key

7 ESC key: Aborts a value, a parameter or a menu to return to the previous selection

6 Key for reversing the direction of rotation of the motor

5 Jog dial:

- Press (ENT):
    - To save the current value
    - To enter the selected menu or parameter
- Turn +/-:
    - To increment or decrement a value
    - To go to the next or previous line
    - To increase or decrease the reference if control via the graphic display terminal is activated

Note: Keys **3**, **4**, **5** and **6** can be used to control the drive directly, if control via the graphic display terminal is activated.

To activate the keys on the remote display terminal, you first have to configure **[Ref.1 channel]** (*F r 1*) = **[HMI]** (*L C C*). For more information, see page 151.

Example configuration windows:

Single selection

```
           LANGUAGE
English
Français                         ✓
Deutsch
Italiano
Español

Chinese
Русский
Türkçe
```

When powering up the graphic display terminal for the first time, the user has to select the required language.

When only one selection is possible, the selection made is indicated by ✓ .
Example: Only one language can be chosen.

Multiple selection

```
      PARAMETER SELECTION
           SETTINGS
Ramp increment              ✓
Acceleration---------       ✓
Deceleration---------      ☐
Acceleration 2---------    ☐
Deceleration 2
                    Edit
```

When multiple selection is possible, the selections made are indicated by ✓ .
Example: A number of parameters can be chosen to form the **[USER MENU]**.

Example configuration window for one value:

```
RDY      Term    +0.0 Hz   0.0 A
           Acceleration

        9.51s

Min = 0.00            Max = 99.99
        <<      >>      Quick
```
ENT →
```
RDY      Term    +0.0 Hz   0.0 A
           Acceleration

        9.51s

Min = 0.00            Max = 99.99
        <<      >>      Quick
```

The << and >> arrows (keys F2 and F3) are used to select the digit to be modified, and the jog dial is rotated to increase or decrease this number.

Example visualization of function blocks state:

```
RDY   ⊗  Term   +0.0 Hz   0.0 A
           Acceleration

        9.51s

Min = 0.00            Max = 99.99
        <<      >>      Quick
```

⊗ OFF light: A valid function blocks program is in the ATV32 in stop mode.

❂ ON light: A valid function blocks program is in the ATV32 in run mode. The drive is considered as being in running state and configuration parameters cannot be modified.

Powering up the drive with Graphic display terminal for the first time

When powering up the graphic display terminal for the first time, the user has to select the required language.

```
               LANGUAGE
English
Français                              ✓
Deutsch
Italiano
Español

Chinese
Русский
Türkçe
```

Display after the graphic display terminal has been powered up for the first time.
Select the language and press ENT.

↓   ENT

Remote display terminal option

Description of the remote display terminal

This remote display terminal is a local control unit which can be mounted on the door of the wall-mounted or floor-standing enclosure. It has a cable with connectors, which is connected to the drive serial link (see the documentation supplied with the remote display terminal). With this remote display terminal, up and down arrows are used for navigation rather than a jog dial.

1 Four digits display

2 MODE key (1):
Used to switch
[1.1 SPEED REFERENCE] ($r E F -$),
[1.2 MONITORING] ($N O n -$) and
[1.3 CONFIGURATION] ($C O n F -$)
menus.

3 ESC key
Used to quit a menu/parameter or remove the currently displayed value in order to revert to the previous value retained in the memory

4 RUN key
Executes the function assuming it has been configured

5 Navigation keys

6 ENT key
Used to save the current value or access the selected menu/parameter

8 Key for reversing the direction of rotation of the motor

7 STOP key
Used to stop the motor and perform a reset

(1) If the drive is locked by a code (**[PIN code 1]** ($C O d$) page 298), pressing the MODE key enables you to switch from the **[1.2 MONITORING]** ($N O n -$) menu to the **[1.1 SPEED REFERENCE]** ($r E F -$) menu and vice versa.

To activate the keys on the remote display terminal, you first have to configure **[Ref.1 channel]** ($F r 1$) = **[HMI]** ($L C C$). For more information, see page 151.

Structure of the parameter tables

The parameter tables contained in the descriptions of the various menus are organized as follows.

Example:

| Parameters described in this page can be accessed by: | | | | DRI- > CONF > FULL > FUN- |

| Code	Name / Description		Adjustment range	Factory setting
PId-	**[PID REGULATOR]**			
	Note: This function cannot be used with certain other functions. Follow the instructions on page 159.			
PIF	**[PID feedback ass.]**			**[No]** (*nO*)
nO	**[No]** (*nO*): Not assigned			
AI1	**[AI1]** (*AI1*): Analog input A1			
AI2	**[AI2]** (*AI2*): Analog input A2			
AI3	**[AI3]** (*AI3*): Analog input A3			
PI	**[RP]** (*PI*): Pulse input			
AIU2	**[AI virtual 2]** (*AIU2*): Virtual analog input 2			
OAO1	**[OA01]** (*OAO1*): Function blocks: Analog Output 01			
...	**...**			
OA10	**[OA10]** (*OA10*): Function blocks: Analog Output 10			

1. Way to access the parameters described in this page

2. Submenu code on 4-digit 7-segment display

3. Parameter code on 4-digit 7-segment display

4. Parameter value on 4-digit 7-segment display

5. Name of submenu on graphic display terminal

6. Name of parameter on graphic display terminal

7. Value of parameter on graphic display terminal

Note: The text in square brackets **[ ]** indicates what you will see on the graphic display terminal.

A menu followed by the mention "**(continued)**" appears sometimes to locate you in the structure.

Example:

FUn-	**[APPLICATION FUNCT.]** (continued)
PId-	**[PID REGULATOR]**
	Note: This function cannot be used with certain other functions. Follow the instructions on page 159.

In this case, the mention "**(continued)**" indicates that the **[APPLICATION FUNCT.]** submenu is above the **[PID REGULATOR]** submenu in the structure.

A parameter can contain some pictograms. Each pictogram has its legend at the end of the table.

Main mictograms:

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
↻	Parameter that can be modified during operation or when stopped.
⧗ 2 s	To change the assignment of this parameter, press the ENT key for 2 s.

Finding a parameter in this document

The following assistance with finding explanations on a parameter is provided:

- With the integrated display terminal and the remote display terminal: Direct use of the parameter code index, page , to find the page giving details of the displayed parameter.

- With the graphic display terminal: Select the required parameter and press F1 (F1) : **[Code]**. The parameter code is displayed instead of its name while the key is held down.

Example: ACC

RDY	Term	+0.0 Hz	0.0 A
	SETTINGS		
Ramp increment	:		0.1
Acceleration	:		9.51 s
Deceleration	:		9.67 s
Low speed	:		0.0 Hz
High speed	:		50.0 Hz
Code	<<	>>	Quick

Code →

RDY	Term	+0.0 Hz	0.0 A
	SETTINGS		
Ramp increment	:		0.1
ACC	:		9.51 s
Deceleration	:		9.67 s
Low speed	:		0.0 Hz
High speed	:		50.0 Hz
Code	<<	>>	Quick

- Then use the parameter code index, page , to find the page giving details of the displayed parameter.

Description of the HMI

Functions of the Display and the Keys

1 The **ESC** key is used for menu navigation (backward) and parameters adjustment (cancel)

2 The **Jog dial** is used for menu navigation (up or down) and parameters adjustment (increase/decrease value or element choice). It can be used as Virtual analogic input 1 for drive frequency reference.

3 The **ENT** key (push on the Jog dial) is used for menu navigation (forward) and parameters adjustment (validate)
A	REF mode selected (r E F -)	E	Dot used to display parameter value (1/10 unit)
B	MON mode selected (П О n -)	F	Current display is parameter value
C	CONF mode selected (C О n F)	G	Current display is parameter unit
D	Dot used to display parameter value (1/100 unit)		

Normal display, with no fault code displayed and no startup:
Displays the parameter selected in the **[1.2 MONITORING]** (П О n -) menu (default: **[Frequency ref.]** (F r H)).

- In It : Initialization sequence (only on remote display terminal)
- t U П : AutoTuning
- d C b : Injection braking
- r d Y : Drive ready
- n S t : Freewheel stop control
- C L I : Current limit
- F S t : Fast stop
- F L U : Fluxing function is activated
- n L P : Control is powered on but the DC bus is not loaded
- C t L : Controlled stop
- О b r : Adapted deceleration
- S О C : Stand by output cut
- U S A : Undervoltage alarm
- S S I : Safety SS1 level
- S L S : Safety SLS level
- S t О : Safety STO level

In the event of a detected fault, the display will flash to notify the user accordingly. If a graphic display terminal is connected, the name of the detected fault will be displayed.

Structure of the menus

Powering up		Parameter selection
	This parameter is only visible when the drive is powered up for the first time. The setting can be amended subsequently in the menu **[MOTOR CONTROL]** (d r C -) for **[Standard mot. freq]** (b F r) **[1.1 SPEED REFERENCE]** (r E F -) **[1.2 MONITORING]** (П П n -) **[1.3 CONFIGURATION]** (C П n F)	

On the 7-segment display, a dash after menu and submenu codes is used to differentiate them from parameter codes.

Example: **[APPLICATION FUNCT.]** (F U n -) menu, **[Acceleration]** (A C C) parameter

Selection of multiple assignments for one parameter

Example: List of group 1 alarms in **[INPUTS / OUTPUTS CFG]** (I _ О -) menu

A number of alarms can be selected by "checking" them as follows.

The digit on the right indicates:

selected   not selected
The same principle is used for all multiple selections.

Setup

2

What's in this Chapter?

This chapter contains the following topics:

Topic	Page
Steps for setting-up the drive	
Preliminary recommendations	

Steps for setting-up the drive

INSTALLATION

1. Please refer to the installation manual.

PROGRAMMING

2. Apply input power to the drive, but do not give a run command.

3. Configure:

- The nominal frequency of the motor
  [Standard mot. freq] (*b F r*) page 84 if this is not 50 Hz.
- The motor parameters in the **[MOTOR CONTROL]** (*d r C -*)
  menu, page 102, only if the factory configuration of the drive is
  not suitable.
- The application functions in the
  [INPUTS / OUTPUTS CFG] (*I _ O -*) menu, page 122, the
  [COMMAND] (*C t L -*) menu, page 151, and the
  [APPLICATION FUNCT.] (*F U n -*) menu, page 164, only if the
  factory configuration of the drive is not suitable.

4. In the **[SETTINGS]** (*S E t -*) menu, adjust the following parameters:

- **[Acceleration]** (*A C C*), page 85 and
  [Deceleration] (*d E C*), page 85.
- **[Low speed]** (*L S P*), page 85 and
  [High speed] (*H S P*), page 87.
- **[Mot. therm. current]** (*I t H*), page 85.

5. Start the drive.

Tips:

- Before beginning programming, complete the customer
  setting tables, page 319.
- Use the **[Restore config.]** (*F C S*) parameter, page 79, to
  return to the factory settings at any time.
- To locate the description of a function quickly, use the index
  of functions page 317.
- Before configuring a function, read carefully the "Function
  compatibility" section page 162.

Note: The following operations must be performed for
optimum drive performance in terms of accuracy and
response time:

- Enter the values indicated on the motor rating plate in the
  [MOTOR CONTROL] (*d r C -*) menu, page 102.
- Perform auto-tuning with the motor cold and connected
  using the **[Auto-tuning]** (*t U n*) parameter, page 85.

Preliminary recommendations

Before powering up the drive

⚠ DANGER
UNINTENDED EQUIPMENT OPERATION
Read and understand this manual before installing or operating the ATV32 drive.
Any changes made to the parameter settings must be performed by qualified personnel.
Check that all logic inputs are inactive to avoid any unintended operation.
Failure to follow these instructions will result in death or serious injury.

Start-up

Note: When factory settings apply and during power-up/manual reset or after a stop command, the motor can only be powered once the "forward", "reverse" and "DC injection stop" commands have been reset. If they have not been reset, the drive will display **[Freewheel stop]** (nSt) but will not start. If the automatic restart function has been configured (**[Automatic restart]** (Atr) parameter in the **[FAULT MANAGEMENT]** ($FLt-$) menu, page 247), these commands are taken into account without a reset (to zero) being necessary.

Line contactor

CAUTION
RISK OF DAMAGE TO DRIVE
Frequent use of the contactor will cause premature aging to the charge circuit of the filter capacitors.
Do not power-up the drive less than every 60 seconds.
Failure to follow these instructions can result in equipment damage.

Using a motor with a lower rating or dispensing with a motor altogether

With the factory settings, motor output phase loss detection is active (**[Output Phase Loss]** (OPL) = **[Yes]** (YES), page 253). To avoid having to use a motor with the same rating as the drive when testing the drive or during a maintenance phase, deactivate the motor output phase loss detection (**[Output Phase Loss]** (OPL) = **[No]** (nO)). This can prove particularly useful if very large drives are being tested with a small motor.

Set **[Motor control type]** (Ctt), page 102, to **[Standard]** (Std) in **[Motor control menu]** ($drC-$).

CAUTION
RISK OF DAMAGE TO THE MOTOR
Motor thermal protection will not be provided by the drive if the motor 's nominal current is 20% lower than that of the drive.
In this case, find an alternative source of thermal protection.
Failure to follow these instructions can result in equipment damage.

⚠ ⚠ DANGER
HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH
If **[Output Phase Loss]** (OPL) is set to **[No]** (nO), Loss of cable is not detected.
Check that this action will not endanger personnel or equipment in any way.
Failure to follow these instructions will result in death or serious injury.

Programming

II

What's in this Part?

This part contains the following chapters:

Reference Mode (rEF)

4

What's in this Chapter?

This chapter contains the following topics:

Introduction

Use the reference mode to monitor and, if the reference channel is the analog input 1 (**[Ref.1 channel]** (*F r 1*) page 151 set to **[AI virtual 1]** (*A 1U 1*)), adjust the actual reference value by modifying the analog input voltage value.

If local control is enabled (**[Ref.1 channel]** (*F r 1*) page 151 set to **[HMI]** (*L C C*)), the jog dial on the remote display terminal or the Up/Down Navigation keys on the remote display terminal acts as a potentiometer to change the reference value up and down within the limits preset by other parameters (**[Low speed]** (*L S P*) or **[High speed]** (*H S P*)).

There is no need to press the ENT key to confirm the change of the reference.
Organization tree

(1) Depending on the active reference channel

Possible values:
(*A I U I*)
(*L F r*)
(*Π F r*)
(*r P I*)
(*F r H*)
(*r P C*)

(2) 2 s or ESC

Displayed parameter value and unit of the diagram are given as examples.

Parameters described in this page can be accessed by:			DRI- > REF-

Menu

Code	Name / Description	Adjustment range	Factory setting
dr 1-	**[1 DRIVE MENU]**		
rEF-	**[1.1 SPEED REFERENCE]** Displayed parameters depend on drive settings.		
A IU 1 ★ () (1)	**[Image input AIV1]** First virtual AI value. This parameter allows to modify the frequency reference with the embedded jog dial.	0 to 100% of HSP-LSP	0%
LFr ★ () (1)	**[HMI Frequency ref.]** HMI frequency reference (signed value). This parameter allows to modify the frequency reference with the remote HMI.	-599 to +599 Hz	0 Hz
ΠFr ★ ()	**[Multiplying coeff.]** Multiply frequency variable. Multiplying coefficient, can be accessed if **[Multiplier ref.-]** (ΠA2,ΠA3) page 166 has been assigned to the graphic terminal.	0 to 100%	100%
rP 1 ★ () (1)	**[Internal PID ref.]** PID: Internal reference PI. This parameter allows to modify the PID internal reference with the jog dial. Internal PID reference is visible if **[PID feedback]** (P IF) is not set to **[No]** (nO).	0 to 32,767	150
FrH ★	**[Frequency ref.]** Frequency reference before ramp (signed value). Actual frequency reference applied to the motor regardless of which reference channel has been selected. This parameter is in read-only mode. Frequency reference is visible if the command channel is not HMI or virtual AI.	-599 to +599 Hz	-
rPC ★	**[PID reference]** PID: Setpoint value. PID reference is visible if **[PID feedback]** (P IF) is not set to **[No]** (nO).	0 to 65,535	-

(1) It is not necessary to press the ENT key to confirm the modification of the reference.
★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
() Parameter that can be modified during operation or when stopped.

Monitoring Mode (MOn)

5

What's in this Chapter?

This chapter contains the following topics:

Introduction

The parameters can be accessed when the drive is running or stopped.

Some functions have numerous parameters. In order to clarify programming and avoid having to scroll through endless parameters, these functions have been grouped in submenus. Like menus, submenus are identified by a dash after their code.

When the drive is running, the value displayed is one of the monitoring parameters. By default, the value displayed is the input frequency reference (**[Frequency ref.]** (*F r H*) parameter page 48).

While the value of the new monitoring parameter required is being displayed, press a second time on the jog dial key to display the units or press and hold down the jog dial (ENT) again (for 2 seconds) to confirm the change of monitoring parameter and store it. From then on, it is the value of this parameter that will be displayed during operation (even after powering down).

Unless the new choice is confirmed by pressing and holding down ENT again, the display will revert to the previous parameter after powering down.

Note: After the drive has been turned off or following a loss of line supply, the parameter displayed is the drive status (example: **[Ready]** (*r d Y*)). The selected parameter is displayed following a run command.

Organization tree

Displayed parameters of the diagram are given as examples.

(1) Visible only with graphic display terminal

Menu

Code	Name / Description	Unit
⊓O⊓ -	**[1.2 MONITORING]**	
A I U I ↻	**[Image input AIV1]**	%
	First virtual AI value. This parameter is read-only. It enables you to display the speed reference applied to the motor.	
F r H	**[Frequency ref.]**	Hz
	Frequency reference before ramp (signed value). This parameter is read-only. It enables you to display the speed reference applied to the motor, regardless of which reference channel has been selected.	
S t F r	**[Stator Frequency]**	Hz
	Displays the estimated stator frequency in Hz (signed value)	
L F r	**[HMI Frequency ref.]**	Hz
	HMI frequency reference (signed value). This parameter only appears if the function has been enabled. It is used to change the speed reference from the remote control. ENT does not have to be pressed to enable a change of reference.	
⊓F r ★ ↻	**[Multiplying coeff.]**	%
	Multiply frequency variable. Multiplying coefficient, can be accessed if **[Multiplier ref. -]** (⊓A 2, ⊓A 3) page 166 has been assigned.	
⊓⊓F	**[Measured output fr.]**	Hz
	Measured motor frequency (signed value) The measured motor speed is displayed if the speed monitoring card has been inserted. (VW3A3620)	
r F r	**[Output frequency]**	Hz
	Estimated motor frequency (signed value).	
F 9 5 ★	**[Pulse in. work. freq.]**	Hz
	Measured frequency of the "Pulse input" input (see page 262).	
U L ⊓	**[Mains voltage]**	V
	Main voltage (from DC bus). Line voltage based on DC bus measurement, motor running or stopped.	
t H r	**[Motor thermal state]**	%
	Motor thermal state. 100% = Nominal thermal state, 118% = "OLF" threshold (motor overload).	
t H d	**[Drv.thermal state]**	%
	Drive thermal state. 100% = Nominal thermal state, 118% = "OHF" threshold (drive overload).	
⊓⊓O -	**[MONIT. MOTOR]**	
S P d	**[Motor speed]**	rpm
	Motor speed in rpm. (Estimated value)	
U O P	**[Motor voltage]**	V
	Motor voltage. (Estimated value)	
O P r	**[Motor power]**	%
	Output power monitoring (100% = nominal motor power, estimated value based on current measure).	
O t r	**[Motor torque]**	%
	Output torque value (100% = nominal motor torque, estimated value based on current measure).	
L C r	**[Motor current]**	A
	Estimated motor current. (Value measured)	

	Parameters described in this page can be accessed by:	DRI- > MON- > IOM- > LIA-

Code	Name / Description	Unit
ΠΟn -	**[1.2 MONITORING]** (continued)	
ΠΠΟ -	**[MONIT. MOTOR]**	
I2tΠ	**[I²t overload level]** Monitoring of I²t overload level This parameter can be accessed if **[I²t model activation]** (*I2tA*) is set to **[Yes]** (*YES*) see page 216	%
IOΠ -	**[I/O MAP]**	
L IA -	**[LOGIC INPUT CONF.]** Logic input functions.	
L IA	**[LI1 assignment]** Read-only parameters, cannot be configured. It displays all the functions that are assigned to the logic input in order to check for multiple assignments. If no functions have been assigned, **[No]** (*nO*) is displayed. Use the jog dial to scroll through the functions. The use of graphic display terminal allows to see the delay **[LI1 On Delay]** (*L Id*). Possible values are the same than in configuration menu page 124.	
L 2A to *L 6A* *LA IA* *LA 2A*	**[L-- assignment]** All the logic inputs available on the drive are processed as in the example for LI1 above.	
L IS I	**[State of logic inputs LI1 to LI6]** Can be used to visualize the state of logic inputs LI1 to LI6 (display segment assignment: high = 1, low = 0). Example above: LI1 and LI6 are at 1; LI2 to LI5 are at 0.	
L IS 2	**[State of Safe Torque Off]** Can be used to visualize the state of LA1, LA2 and STO (Safe Torque Off) (display segment assignment: high = 1, low = 0). Example above: LA1 and LA2 are at 0; STO (Safe Torque Off) is at 1.	

	Parameters described in this page can be accessed by:	DRI- > MON- > IOM- > AIA-

Code	Name / Description	Unit
A IA -	**[ANALOG INPUTS IMAGE]**	
	Analog input functions.	
A I IC	**[AI1]**	V
	AI1 customer image: Value of analog input 1.	
A I IA	**[AI1 assignment]**	
	AI1 functions assignment. If no functions have been assigned, **[No]** (*nO*) is displayed. Following parameters are visible on the graphic display terminal by pressing the ENT key on the parameter.	
nO	**[No]** (*nO*): Not assigned	
Fr I	**[Ref.1 channel]** (*Fr I*): Reference source 1	
Fr 2	**[Ref.2 channel]** (*Fr 2*): Reference source 2	
SA2	**[Summing ref. 2]** (*SA2*): Summing reference 2	
P IF	**[PID feedback]** (*P IF*): PI feedback (PI control)	
tAA	**[Torque limitation]** (*tAA*): Torque limitation: Activation by an analog value	
dA2	**[Subtract. ref. 2]** (*dA2*): Subtracting reference 2	
P In	**[Manual PID ref.]** (*P In*): Manual speed reference of the PI(D) regulator (auto-man)	
FP I	**[PID speed ref.]** (*FP I*): Speed reference of the PI(D) regulator (predictive reference)	
SA3	**[Summing ref. 3]** (*SA3*): Summing reference 3	
Fr Ib	**[Ref.1B channel]** (*Fr Ib*): Reference source 1B	
dA3	**[Subtract. ref. 3]** (*dA3*): Subtracting reference 3	
FLOC	**[Forced local]** (*FLOC*): Forced local reference source	
MA2	**[Ref. 2 multiplier]** (*MA2*): Multiplying reference 2	
MA3	**[Ref. 3 multiplier]** (*MA3*): Multiplying reference 3	
PES	**[Weight input]** (*PES*): External weight measurement function	
IAO I	**[IA01]** (*IAO I*): Functions blocks: Analog Input 01	
. . .	**...**	
IA IO	**[IA10]** (*IA IO*): Functions blocks: Analog Input 10	
U IL I	**[AI1 min value]**	V
	Voltage scaling parameter of 0%.	
U IH I	**[AI1 max value]**	V
	Voltage scaling parameter of 100%.	
A I IF	**[AI1 filter]**	s
	Interference filtering cut-off time of the low-filter.	
A IA -	**[ANALOG INPUTS IMAGE]** (continued)	
	Analog input functions.	
A I2C	**[AI2]**	V
	AI2 customer image: Value of analog input 2.	
A I2A	**[AI2 assignment]**	
	AI2 functions assignment. If no functions have been assigned, **[No]** (*nO*) is displayed. Following parameters are visible on the graphic display terminal by pressing the ENT key on the parameter. Identical to **[AI1 assignment]** (*A I IA*) page 50.	
U IL 2	**[AI2 min value]**	V
	Voltage scaling parameter of 0%.	
U IH 2	**[AI2 max value]**	V
	Voltage scaling parameter of 100%.	
A I2F	**[AI2 filter]**	s
	Interference filtering cutoff time of the low-filter.	

Parameters described in this page can be accessed by:	DRI- > MON- > IOM- > AIA- > AI3C

Code	Name / Description	Unit
A I A -	**[ANALOG INPUTS IMAGE]** (continued) Analog input functions.

ΠΟn -	**[1.2 MONITORING]** (continued)	
CΠΠ -	**[COMMUNICATION MAP]**	
	This menu is visible only on graphic display terminal, except for **[COM. SCANNER INPUT MAP]**.(*ISA -*) and **[COM SCAN MAP]**.(*OSA -*) menus.	
CΠdC	**[Command channel]** Active command channel.	
tErΠ *HΠ1* *Πdb* *CAn* *tUd* *nEt* *P S*	**[Terminals]** (*tErΠ*): Terminals **[HMI]** (*HΠ1*): Graphic display terminal or remote display terminal **[Modbus]** (*Πdb*): Integrated Modbus **[CANopen]** (*CAn*): Integrated CANopen® **[+/- speed]** (*tUd*): +/- speed command **[Com. card]** (*nEt*): Communication card (if inserted) **[PC tool]** (*P S*): PC software	

CΠd	**[Cmd value]**
	DRIVECOM command register value.
	[Profile] (*CHCF*) is not set to **[I/O profile]** (*IO*), see page 151.
	
	Possible values in CiA402 profile, separate or not separate mode.
	Bit 0: "Switch on"/Contactor command
	Bit 1: "Disable voltage"/Authorization to supply AC power
	Bit 2: "Quick stop"/Emergency stop
	Bit 3: "Enable operation"/Run command
	Bit 4 to Bit 6: Reserved (set to 0)
	Bit 7: "Fault reset"/Fault acknowledgment active on 0 to 1 rising edge
	Bit 8: Halt Stop according to the **[Type of stop]** (*Stt*) parameter without leaving the Operation enabled state
	Bit 9: Reserved (set to 0)
	Bit 10: Reserved (set to 0)
	Bit 11 to Bit 15: Can be assigned to a command
	
	Possible values in the I/O profile.
	On state command **[2 wire]** (*2C*).
	Bit 0: Forward (on state) command
	    = 0: No forward command
	    = 1: Forward command
	The assignment of bit 0 cannot be modified. It corresponds to the assignment of the terminals. It can be switched. Bit 0 (*CdOO*) is only active if the channel of this control word is active.
	Bit 1 to Bit 15: Can be assigned to commands.
	
	On edge command **[3 wire]** (*3C*).
	Bit 0: Stop (run authorization).
	    = 0: Stop
	    = 1: Run is authorized on a forward or reverse command
	Bit 1: Forward (on 0 to 1 rising edge) command
	The assignment of bits 0 and 1 cannot be modified. It corresponds to the assignment of the terminals. It can be switched. Bits 0 (*CdOO*) and 1 (*CdO1*) are only active if the channel of this control word is active.
	Bit 2 to Bit 15: Can be assigned to commands	

rFCC	**[Active ref. channel]** HMI reference channel.

FrH	**[Frequency ref.]**	Hz
	Frequency reference before ramp.	

		DRI- > MON- > CMM-
Parameters described in this page can be accessed by:		

Code	Name / Description	Unit

E t A	**[ETA state word]**
	DRIVECOM status word.
	
	Possible values in CiA402 profile, separate or not separate mode.
	Bit 0: "Ready to switch on", awaiting power section line supply
	Bit 1: "Switched on", ready
	Bit 2: "Operation enabled", running
	Bit 3: "Fault"
	  = 0: No fault
	  = 1: Fault
	Bit 4: "Voltage enabled", power section line supply present
	  = 0: Power section line supply absent
	  = 1: Power section line supply present
	When the drive is powered by the power section only, this bit is always at 1.
	Bit 5: Quick stop/Emergency stop
	Bit 6: "Switched on disabled", power section line supply locked
	Bit 7: Alarm
	  = 0: No alarm
	  = 1: Alarm
	Bit 8: Reserved (= 0)
	Bit 9: Remote: command or reference via the network
	  = 0: Command or reference via the graphic display terminal or the remote display terminal
	  = 1: Command or reference via the network
	Bit 10: Target reference reached
	  = 0: The reference is not reached
	  = 1: The reference has been reached
	When the drive is in speed mode, this is the speed reference.
	Bit 11: "Internal limit active", reference outside limits
	  = 0: The reference is within the limits
	  = 1: The reference is not within the limits
	When the drive is in speed mode, the limits are defined by the **[Low speed]** (L S P) and **[High speed]** (H S P) parameters.
	Bit 12 and Bit 13: Reserved (= 0)
	Bit 14: "Stop key", STOP via stop key
	  = 0: STOP key not pressed
	  = 1: Stop triggered by the STOP key on the graphic display terminal or the remote display terminal
	Bit 15: "Direction", direction of rotation
	  = 0: Forward rotation at output
	  = 1: Reverse rotation at output
	
	The combination of bits 0, 1, 2, 4, 5 and 6 defines the state in the DSP 402 state chart (see the Communication manuals).
	
	Possible values in the I/O profile.
	Note: The value is identical in the CiA402 profile and the I/O profile. In the I/O profile, the description of the values is simplified and does not refer to the CiA402 (Drivecom) state chart.
	Bit 0: Reserved (= 0 or 1)
	Bit 1: Ready
	  = 0: Not ready
	  = 1: Ready
	Bit 2: Running
	  = 0: The drive will not start if a reference other than zero is applied.
	  = 1: Running, if a reference other than zero is applied, the drive can start.
	Bit 3: Fault
	  = 0: No fault
	  = 1: Fault
	Bit 4: Power section line supply present
	  = 0: Power section line supply absent
	  = 1: Power section line supply present
	Bit 5: Reserved (= 1)
	Bit 6: Reserved (= 0 or 1)
	Bit 7: Alarm
	  = 0: No alarm
	  = 1: Alarm
	Bit 8: Reserved (= 0)
	Bit 9: Command via a network
	  = 0: Command via the terminals or the graphic display terminal
	  = 1: Command via a network

OHF	**[Drive overheat]** (OHF): Drive overheating	
OLC	**[Proc.Overload Flt]** (OLC): Torque overload	
OLF	**[Motor overload]** (OLF): Motor overload	
OPF1	**[1 output phase loss]** (OPF1): Motor 1-phase loss	
OPF2	**[3out ph loss]** (OPF2): Motor 3-phases loss	
OSF	**[Mains overvoltage]** (OSF): Oversupply detected fault	
OtFL	**[PTC fault]** (OtFL): Motor overheating detected error from PTCL: standard product	
PHF	**[Input phase loss]** (PHF): Main input 1-phase loss	
PtFL	**[LI6=PTC probe]** (PtFL): PTCL detected error (OC or SC)	
SAFF	**[Safety]** (SAFF): Safety function trip	
SCF1	**[Motor short circuit]** (SCF1): Motor short circuit (hard detection)	
SCF3	**[Ground short circuit]** (SCF3): Direct ground short-circuit trip (hard detection)	
SCF4	**[IGBT short circuit]** (SCF4): IGBT short-circuit (hard detection)	
SCF5	**[Motor short circuit]** (SCF5): Load short-circuit during Igon load sequence (hard detection)	
SLF1	**[Modbus com.]** (SLF1): Modbus local serial communication interruption	
SLF2	**[PC com.]** (SLF2): PC Software communication interruption	
SLF3	**[HMI com.]** (SLF3): Remote terminal communication interruption	
SOF	**[Overspeed]** (SOF): Overspeed	
SPF	**[Speed fdback loss]** (SPF): Speed feedback loss	
SSF	**[Torque/current lim]** (SSF): Torque current limitation detected fault	
tJF	**[IGBT overheat]** (tJF): IGBT overheating	
tnF	**[Auto-tuning]** (tnF): Tune detected fault	
ULF	**[Pr.Underload Flt]** (ULF): Torque underload	
USF	**[Undervoltage]** (USF): Undervoltage	
HS1	**[Drive state]** HMI Status of the detected fault record 1.	
tUn	**[Auto-tuning]** (tUn): Auto-tuning	
dCb	**[In DC inject.]** (dCb): Injection braking	
rdY	**[Ready]** (rdY): Drive ready	
nSt	**[Freewheel]** (nSt): Freewheel stop control	
rUn	**[Drv running]** (rUn): Motor in steady state or run command present and zero reference	
ACC	**[In accel.]** (ACC): Acceleration	
dEC	**[In decel.]** (dEC): Deceleration	
CL1	**[Current lim.]** (CL1): Current limit (in case of using a synchronous motor, if the motor does not start, follow the procedure page 109)	
FSt	**[Fast stop]** (FSt): Fast stop	
FLU	**[Mot. fluxing]** (FLU): Fluxing function is activated	
nLP	**[no mains V.]** (nLP): Control is powered on but the DC bus is not loaded	
CtL	**[control.stop]** (CtL): Controlled stop	
Obr	**[Dec. adapt.]** (Obr): Adapted deceleration	
SOC	**[Output cut]** (SOC): Stand by output cut	
USA	**[UnderV. al.]** (USA): Undervoltage alarm	
tC	**[In mfg. test]** (tC): TC indus mode activated	
St	**[in autotest]** (St): Self test in progress	
FA	**[autotest err]** (FA): Self test detected error	
YES	**[Autotest OK]** (YES): Self test OK	
EP	**[eeprom test]** (EP): Self test Eeprom detected error	
FLt	**[In fault]** (FLt): Product has detected a fault	
SS1	**[SS1 active]** (SS1): Safety SS1 level	
SLS	**[SLS active]** (SLS): Safety SLS level	
StO	**[STO active]** (StO): Safety STO level	
EP1	**[ETA state word]** DRIVECOM status register of detected fault record 1 (same as **[ETA state word]** (EtA) page 55).	
IP1	**[ETI state word]** Extended status register of detected fault record 1 (see the communication parameters file).	
CMP1	**[Cmd word]** Command register of detected fault record 1 (same as **[Cmd word]** (CMd) page 54).

S S F	**[Torque/current lim]** (S S F): Torque current limitation detected fault	
t J F	**[IGBT overheat]** (t J F): IGBT overheating	
t n F	**[Auto-tuning]** (t n F): Tune detected fault	
U L F	**[Pr.Underload Flt]** (U L F): Torque underload	
U S F	**[Undervoltage]** (U S F): Undervoltage	

Parameters described in this page can be accessed by:		DRI- > MON- > AFI-

Code	Name / Description	Unit
AFI-	**[MORE FAULT INFO]** Additional detected fault information.	
CnF	**[Network fault]** Communication option card fault code. This parameter is read-only. The fault code remains saved in the parameter, even if the cause disappears. The parameter is reset after the drive is disconnected and then reconnected. The values of this parameter depend on the network card. Consult the manual for the corresponding card.	
ILF1	**[Internal link fault 1]** Communication interruption between option card 1 and drive. This parameter is read-only. The fault code remains saved in the parameter, even if the cause disappears. The parameter is reset after the drive is disconnected and then reconnected.	
SFFE	**[Safety fault reg.]** (1) Safety function fault error register. Bit0 = 1: Logic inputs debounce time-out (verify value of debounce time LIDT according to the application) Bit1 Reserved Bit2 = 1: Motor speed sign has changed during SS1 ramp Bit3 = 1: Motor speed has reached the frequency limit threshold during SS1 ramp. Bit4: Reserved Bit5: Reserved Bit6 = 1: Motor speed sign has changed during SLS limitation Bit7 = 1: Motor speed has reached the frequency limit threshold during SS1 ramp. Bit8: Reserved Bit9: Reserved Bit10: Reserved Bit11: Reserved Bit12: Reserved Bit13 = 1: Not possible to measure the motor speed (verify the motor wiring connection) Bit14 = 1: Motor ground short-circuit detected (verify the motor wiring connection) Bit15 = 1: Motor phase to phase short-circuit detected (verify the motor wiring connection)	
SAF1	**[Safety fault Reg1]** (1) Safety fault register 1. Application control error register. Bit0 = 1: PWRM consistency detected error Bit1 = 1: Safety functions parameters detected error Bit2 = 1: Application auto test has detected an error Bit3 = 1: Diagnostic verification of safety function has detected an error Bit4 = 1: Logical input diagnostic has detected an error Bit5 = 1: Application hardware watchdog active Bit6 = 1: Application watchdog management active Bit7 = 1: Motor control detected error Bit8 = 1: Internal serial link core detected error Bit9 = 1: Logical input activation detected error Bit10 = 1: Safe Torque Off function has triggered an error Bit11 = 1: Application interface has detected an error of the safety functions Bit12 = 1: Safe Stop 1 function has detected an error of the safety functions Bit13 = 1: Safely Limited Speed function has triggered an error Bit14 = 1: Motor data is corrupted Bit15 = 1: Internal serial link data flow detected error	

(1) Hexadecimal values are displayed on the Graphic display terminal
   Example:
   SFFE = **0x0008** in Hexadecimal
   SFFE = Bit **3**

Code	Name / Description	Unit
SAF2	**[Safety fault Reg2]** (1) Safety fault register 2 Motor Control error register Bit0 = 1 : Consistency stator frequency verification has detected an error Bit1 = 1 : Stator frequency estimation detected error Bit2 = 1 : Motor control watchdog management is active Bit3 = 1 : Motor control hardware watchdog is active Bit4 = 1 : Motor control auto test has detected an error Bit5 = 1 : Chain testing detected error Bit6 = 1 : Internal serial link core detected error Bit7 = 1 : Direct short-circuit detected error Bit8 = 1 : PWM driver detected error Bit9 : Reserved Bit10 : Reserved Bit11 = 1 : Application interface has detected an error of the safety functions Bit12 = 1 : Reserved Bit13: Reserved Bit14 = 1 : Motor data is corrupted Bit15 = 1 : Internal serial link data flow detected error	
SF00	**[SAFF Subcode 0]** (1) Safety fault subregister 00 Appplication auto test error register Bit0 : Reserved Bit1 = 1 : Ram stack overflow Bit2 = 1 : Ram address integrity error Bit3 = 1 : Ram data access error Bit4 = 1 : Flash Checksum Error Bit5 : Reserved Bit6 : Reserved Bit7 : Reserved Bit8 : Reserved Bit9 = 1 : Fast task overflow Bit10 = 1 : Slow task overflow Bit11 = 1 : Application task overflow Bit12 : Reserved Bit13 : Reserved Bit14 = 1 : PWRM line is not activated during initialization phase Bit15 = 1 : Application hardware Watch Dog is not running after initialization	
SF01	**[SAFF Subcode 1]** (1) Safety fault subregister 01 Logical input diagnostics error register Bit0 = 1 : Management - state machine error Bit1 = 1 : Data required for test management are corrupted Bit2 = 1 : Channel selection detected error Bit3 = 1 : Testing - state machine detected error Bit4 = 1 : Test request is corrupted Bit5 = 1 : Pointer to test method is corrupted Bit6 = 1 : Incorrect test action provided Bit7 = 1 : Detected Error in results collecting Bit8 = 1 : LI3 detected error. Cannot activate safe function Bit9 = 1 : LI4 detected error. Cannot activate safe function Bit10 = 1 : LI5 detected error. Cannot activate safe function Bit11 = 1 : LI6 detected error. Cannot activate safe function Bit12 = 1 : Test sequence updated while a diagnostic is in progress Bit13 = 1 : Detected error in test pattern management Bit14 : Reserved Bit15 : Reserved

	     appears on the screen to indicate that access has been locked.
	[ON] (◻ ⌐): A code is locking access (2 to 9,999).
	   - To unlock access, enter the code (incrementing the display using the jog dial) and press ENT. The code remains on the
	     display and access is unlocked until the next time the drive is turned off. Access will be locked again the next time the drive
	     is turned on.
	   - If an incorrect code is entered, the display changes to **[ON]** (◻ ⌐), and access remains locked.
	Access is unlocked (the code remains on the screen).
	   - To reactivate locking with the same code when access has been unlocked, return to **[ON]** (◻ ⌐) using the jog dial and then
	     press ENT. **[ON]** (◻ ⌐) remains on the screen to indicate that access has been locked.
	   - To lock access with a new code when access has been unlocked, enter the new code (increment the display using the jog
	     dial) and then press ENT. **[ON]** (◻ ⌐) appears on the screen to indicate that access has been locked.
	   - To clear locking when access has been unlocked, return to **[OFF]** (◻ F F) using the jog dial and then press ENT.
	     [OFF] (◻ F F) remains on the display. Access is unlocked and will remain so until the next restart.	

⊏ ◻ ⌐ 2 ★ ◻ F F ◻ ⌐ 8 8 8 8	**[PIN code 2]** Confidential code 2. Visible if **[3.1 ACCESS LEVEL]** (L ⅃ ⊏) is set to **[Expert]** (E P ⌐). The value **[OFF]** (◻ F F) indicates that no password has been set **[Unlocked]** (U L ⊏). The value **[ON]** (◻ ⌐) indicates that the drive configuration is protected and an access code must be entered in order to unlock it. Once the correct code has been entered, it remains on the display and the drive is unlocked until the next time the power supply is disconnected. PIN code 2 is an unlock code known only to Schneider Electric Product Support.	
U L ⌐ U L ⌐ ◻ U L ⌐ 1	**[Upload rights]** **[Permitted]** (U L ⌐ ◻): Means that SoMove or the graphic display terminal can save the whole configuration (password, protections, configuration). When the configuration is edited, only the non protected parameters will be accessible. **[Not allowed]** (U L ⌐ 1): Means that SoMove or the graphic display terminal cannot save the configuration	
⌐ L ⌐ ⌐ L ⌐ ◻ ⌐ L ⌐ 1 ⌐ L ⌐ 2 ⌐ L ⌐ 3	**[Download rights]** **[Locked drv]** (⌐ L ⌐ ◻): Locked drive: means that the configuration can be downloaded only in a locked drive which configuration has the same password. If the passwords are different, download is not permitted. **[Unlock. drv]** (⌐ L ⌐ 1): Unlocked drive: means that the configuration can be downloaded only in a drive without active password **[Not allowed]** (⌐ L ⌐ 2): Not allowed: the configuration cannot be downloaded **[Lock/unlock]** (⌐ L ⌐ 3): Lock. + Not: download is permitted following case 0 or case 1	

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⟳ Parameter that can be modified during operation or when stopped.

Configuration Mode (ConF)

6

What's in this Chapter?

This chapter contains the following topics:

Introduction

Configuration mode includes 4 parts:

1. "My Menu" menu includes up to 25 parameters available for user customization using the graphic display terminal or SoMove software.

2. Store/recall parameter set: These 2 functions are used to store and recall customer settings.

3. **[Macro configuration]** (*C F G*) parameter which allows to load predefined values for applications (see page 80).

4. FULL: This menu provides access to all other parameters. It includes 10 sub-menus:

- **[SIMPLY START]** (*S I M -*) page 83
- **[SETTINGS]** (*S E t -*) page 87
- **[MOTOR CONTROL]** (*d r C -*) page 102
- **[INPUTS / OUTPUTS CFG]** (*I _ O -*) page 122
- **[COMMAND]** (*C t L -*) page 151
- **[FUNCTION BLOCK]** (*F b M -*) page 155
- **[APPLICATION FUNCT.]** (*F U n -*) page 164
- **[FAULT MANAGEMENT]** (*F L t -*) page 247
- **[COMMUNICATION]** (*C O M -*) page 272
- **[ACCESS LEVEL]** (*L A C*) page 278

Organization tree

Displayed parameter values are given as examples only.
My Menu

Code	Name / Description
$\mathit{C\,O\,n\,F}$	**[1.3 CONFIGURATION]**
$\mathit{\Pi\,Y\,\Pi\,n}$	**[MY MENU]**
	This menu contains the parameters selected in the **[3.4 DISPLAY CONFIG.]** ($\mathit{d\,C\,F\,-}$) menu on page 285.

Configuration Mode (ConF)

Factory Settings

Code	Name / Description	Factory setting
C O n F	**[1.3 CONFIGURATION]**	
F C S -	**[FACTORY SETTINGS]**	
F C S 1 ★	**[Config. Source]** Choice of source configuration. If the configuration switching function is configured, it will not be possible to access **[Config 1]** (C F G 1) and **[Config 2]** (C F G 2). **Note:** To load the drive's presettings previously memorized (**[Config 1]** (S t r 1) or **[Config 2]** (S t r 2)), select the source configuration **[Config. Source]** (F C S 1) = **[Config 1]** (C F G 1) or **[Config 2]** (C F G 2) followed by a factory setting **[Goto FACTORY SETTINGS]** (G F S) = **[YES]** (Y E S).	**[Macro-Conf]** (I n 1)
I n 1 C F G 1 C F G 2	**[Macro-Conf]** (I n 1): Factory configuration, return to selected macro configuration **[Config 1]** (C F G 1): Configuration 1 **[Config 2]** (C F G 2): Configuration 2	
F r Y -	**[PARAMETER GROUP LIST]** Selection of menus to be loaded. See the multiple selection procedure on page 33 for the integrated display terminal and page 24 for the graphic display terminal. **Note:** In factory configuration and after a return to "factory settings", **[PARAMETER GROUP LIST]** will be empty.	
A L L d r M M O t C O M d I S	**[All]** (A L L): All parameters (the function blocks program will also be erased) **[Drive configuration]** (d r M): The **[1 DRIVE MENU]** (d r 1 -) menu without **[COMMUNICATION]** (C O M -). In the **[2.4 DISPLAY CONFIG.]** menu, **[Return std name]** (G S P) page 287 returns to **[No]** (n O). **[Motor param]** (M O t): Motor parameters, see page 295. The following selections can only be accessed if **[Config. Source]** (F C S 1) is set to **[Macro-Conf.]** (I n 1). **[Comm. menu]** (C O M): The **[COMMUNICATION]** (C O M -) menu without either **[Scan. In1 address]** (n M A 1) to **[Scan. In8 address]** (n M A 8) or **[Scan.Out1 address]** (n C A 1) to **[Scan.Out8 address]** (n C A 8). **[Display config.]** (d I S): The **[3.3 MONITORING CONFIG.]** (M C F -) menu	
G F S ★ ⧗ 2 s	**[Goto FACTORY SETTINGS]** **⚠ DANGER** **UNINTENDED EQUIPMENT OPERATION** Check that the modification of the current configuration is compatible with the wiring diagram used. **Failure to follow these instructions will result in death or serious injury.** It is only possible to revert to the factory settings if at least one group of parameters has previously been selected.	
n O Y E S	**[No]** (n O): No **[Yes]** (Y E S): The parameter changes back to **[No]** (n O) automatically as soon as the operation is complete	
S C S 1 ★	**[Save config]** The active configuration to be saved does not appear for selection. For example, if it is **[Config 0]** (S t r O), only **[Config 1]** (S t r 1) and **[Config 2]** (S t r 2) appear. The parameter changes back to **[No]** (n O) as soon as the operation is complete.	**[No]** (n O)
n O S t r O S t r 1 S t r 2	**[No]** (n O): No **[Config 0]** (S t r O): Press and hold down the ENT key for 2 s **[Config 1]** (S t r 1): Press and hold down the ENT key for 2 s **[Config 2]** (S t r 2): Press and hold down the ENT key for 2 s	

★　These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⧗ 2 s　To change the assignment of this parameter, press the ENT key for 2 s.

Macro Configuration

Code	Name / Description	Factory setting
C O n F	**[1.3 CONFIGURATION]** (continued)	
C F G	**[Macro configuration]**	**[Start/Stop]** (S t S)

★

⏳ 2 s

> ### ⚠ DANGER
>

F2, F3, F4 keys	[No]	[No]	[No]	[No]	[No]	[No]

In 3-wire control, the assignment of inputs LI1 to LI6 shifts.

(1) To start with, integrated Modbus **[Modbus Address]** (*Add*) must first be configured, page 273.

Note: These assignments are reinitialized every time the macro configuration changes.

Other configurations and settings

In addition to the assignment of inputs/outputs, other parameters are assigned **only in the Hoisting macro configuration**.

Hoisting:

- **[Movement type]** (b 5 t) is set to **[Hoisting]** (U E r) page 191
- **[Brake contact]** (b C I) is set to **[No]** (n O) page 191
- **[Brake impulse]** (b IP) is set to **[Yes]** (Y E 5) page 191
- **[Brake release I FW]** (Ib r) is set to 0 A page 191
- **[Brake Release time]** (b r t) is set to 0 s page 191
- **[Brake release freq]** (b Ir) is set to **[Auto]** (A U t O) page 192
- **[Brake engage freq]** (b E n) is set to **[Auto]** (A U t O) page 192
- **[Brake engage time]** (b E t) is set to 0 s page 192
- **[Engage at reversal]** (b E d) is set to **[No]** (n O) page 192
- **[Jump at reversal]** (J d C) is set to **[Auto]** (A U t O) page 193
- **[Time to restart]** (t t r) is set to 0 s page 193
- **[Current ramp time]** (b r r) is set to 0 s page 195
- **[Low speed]** (L 5 P) is set to Rated motor slip calculated by the drive, page 85
- **[Output Phase Loss]** (O P L) is set to **[Yes]** (Y E 5) page 253
  No further modifications can be made to this parameter.
- **[Catch on the fly]** (F L r) is set to **[No]** (n O) page 250
  No further modifications can be made to this parameter.

Return to factory settings:
Returning to factory settings with **[Config. Source]** (F C 5 I) is set to **[Macro-Conf]** (In I) page 79 will return the drive to the selected macro configuration. The **[Macro configuration]** (C F G) parameter does not change, although **[Customized macro]** (C C F G) disappears.

Note: The factory settings that appear in the parameter tables correspond to
[Macro configuration] (C F G) = **[Start/Stop]** (5 t 5). This is the macro configuration set at the factory.
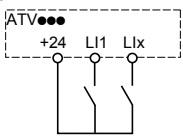

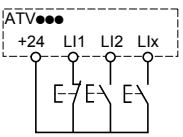

Example diagrams for use with the macro configurations

[Hoisting] (H 5 t) diagram
(1) Whithout integrated safety function, a contact on the Preventa module must be inserted in the brake control circuit to engage it when the "Safe Torque Off" safety function is activated (see connection diagrams in the Installation manual).

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > SIM-

| Code	Name / Description	Adjustment range	Factory setting
CCFG ★ nO YES	**[Customized macro]** Read-only parameter, only visible if at least one macro configuration parameter has been modified. **[No]** (nO): No **[Yes]** (YES): Yes		
bFr 50 60	**[Standard mot. freq]** This parameter modifies the presets of the following parameters: **[Rated motor volt.]** (UnS) below, **[High speed]** (HSP) page 85, **[Freq. threshold]** (Ftd) page 99, **[Rated motor freq.]** (FrS) and **[Max frequency]** (tFr) . **[50Hz IEC]** (50): Drive 50 Hz **[60Hz NEMA]** (60): Drive 60 Hz		**[50Hz IEC]** (50)
IPL ★ nO YES	**[Input phase loss]** This parameter is only accessible in this menu on 3-phase drives. If one phase disappears, the drive switches to fault mode **[Input phase loss]** (PHF), but if 2 or 3 phases disappear, the drive continues to operate until it trips on an undervoltage detected fault (the drive trips in **[Input phase loss]** (PHF) if there is an input phase loss and if this leads to performance decrease). See **[Input phase loss]** (IPL) page 253. **[Ignore]** (nO): Detected fault ignored, to be used when the drive is supplied via a single-phase supply or by the DC bus **[Freewheel]** (YES): With freewheel stop	Yes or No, according to drive rating	
nPr ★	**[Rated motor power]** Rated motor power given on the nameplate, in kW if **[Standard mot. freq]** (bFr) is set to **[50Hz IEC]** (50), in HP if **[Standard mot. freq]** (bFr) is set to **[60Hz NEMA]** (60). See **[Rated motor power]** (nPr) page 104.	According to drive rating	
UnS ★	**[Rated motor volt.]** Rated motor voltage given on the nameplate. ATV32●●●M2: 100 to 240 V – ATV32●●●N4: 200 to 480 V. See **[Rated motor volt.]** (UnS) page 104.	100 to 480 V	According to drive rating
nCr ★	**[Rated mot. current]** Rated motor current given on the nameplate. See **[Rated mot. current]** (nCr) page 104.	0.25 to 1.5 In (1)	According to drive rating and **[Standard mot. freq]** (bFr)
FrS ★	**[Rated motor freq.]** Rated motor frequency given on the nameplate. The factory setting is 50 Hz, or preset to 60 Hz if **[Standard mot. freq]** (bFr) is set to 60 Hz. This parameter is not visible if **[Motor control type]** (Ctt) page 102 is set to **[Sync. mot.]** (SYn). See **[Rated motor freq.]** (FrS) page 104.	10 to 800 Hz	50 Hz
nSP ★	**[Rated motor speed]** Rated motor speed given on the nameplate. This parameter is not visible if **[Motor control type]** (Ctt) page 102 is set to **[Sync. mot.]** (SYn). See **[Rated motor speed]** (nSP) page 104. 0 to 9,999 rpm then 10.00 to 60.00 krpm on the integrated display terminal. If, rather than the rated speed, the nameplate indicates the synchronous speed and the slip in Hz or as a %, calculate the rated speed as follows: Nominal speed = Synchronous speed x $\dfrac{100 - \text{slip as a \%}}{100}$ or Nominal speed = Synchronous speed x $\dfrac{50 - \text{slip in Hz}}{50}$ (50 Hz motors) or Nominal speed = Synchronous speed x $\dfrac{60 - \text{slip in Hz}}{60}$ (60 Hz motors)	0 to 65,535 rpm	According to drive rating

	Parameters described in this page can be accessed by:		DRI- > CONF > FULL > SIM-

Code	Name / Description	Adjustment range	Factory setting
t F r	**[Max frequency]**	10 to 599 Hz	60 Hz
	The factory setting is 60 Hz, or preset to 72 Hz if **[Standard mot. freq]** (*b F r*) is set to 60 Hz. The maximum value is limited by the following conditions: It must not exceed 10 times the value of **[Rated motor freq.]** (*F r S*). See **[Max frequency]** (*t F r*) page 102.		
t U n ()	**[Auto tuning]**		**[No action]** (*n O*)
	For asynchronous motors, see page 105. For synchronous motors, see page 110.		
t U S	**[Auto tuning state]**		**[Not done]** (*t A b*)
	This parameter is not saved at drive power off. It shows the Autotuning status since last power on. See **[Auto tuning state]** (*t U S*) page 105.		
t A b *P E n d* *P r O G* *F A I L* *d O n E*	**[Not done]** (*t A b*): Autotune is not done **[Pending]** (*P E n d*): Autotune has been requested but not yet performed **[In Progress]** (*P r O G*): Autotune is in progress **[Failed]** (*F A I L*): Autotune has detected a fault **[Done]** (*d O n E*): The stator resistance measured by the auto-tuning function is used to control the motor		
S t U n	**[Tune selection]**		**[Default]** (*t A b*)
	See **[Tune selection]** (*S t U n*) page 105.		
t A b *N E A S* *C U S*	**[Default]** (*t A b*): The default stator resistance value is used to control the motor **[Measure]** (*N E A S*): The stator resistance measured by the auto-tuning function is used to control the motor **[Custom]** (*C U S*): The stator resistance set manually is used to control the motor		
I t H ()	**[Mot. therm. current]**	0.2 to 1.5 In (1)	According to drive rating
	Motor thermal protection current, to be set to the rated current indicated on the motor nameplate. See **[Mot. therm. current]** (*I t H*) page 88.		
A C C ()	**[Acceleration]**	0.00 to 6,000 s (2)	3.0 s
	Time to accelerate from 0 to the **[Rated motor freq.]** (*F r S*) (page 84). To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. See **[Acceleration]** (*A C C*) page 87.		
d E C ()	**[Deceleration]**	0.00 to 6,000 s (2)	3.0 s
	Time to decelerate from the **[Rated motor freq.]** (*F r S*) (page 84) to 0. To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. See **[Deceleration]** (*d E C*) page 87.		
L S P ()	**[Low speed]**	0 to 599 Hz	0
	Motor frequency at minimum reference, can be set between 0 and **[High speed]** (*H S P*). See **[Low speed]** (*L S P*) page 87.		
H S P ()	**[High speed]**	0 to 599 Hz	50 Hz
	Motor frequency at maximum reference, can be set between **[Low speed]** (*L S P*) and **[Max frequency]** (*t F r*). The factory setting changes to 60 Hz if **[Standard mot. freq]** (*b F r*) is set to **[60Hz NEMA]** (*6 O*). See **[High speed]** (*H S P*) page 87.		

(1) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.
(2) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6,000 s according to **[Ramp increment]** (*I n r*) page 167.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

dE2 ★ ◯	**[Deceleration 2]** Time to decelerate from the **[Rated motor freq.]** (FrS) page 84 to 0. To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. See **[Deceleration 2]** (dE2) page 168.	0.00 to 6,000 s (1)	5 s
tA1 ★ ◯	**[Begin Acc round]** Rounding of start of acceleration ramp as a % of the **[Acceleration]** (ACC) or **[Acceleration 2]** (AC2) ramp time. Visible if **[Ramp type]** (rPt) is set to **[Customized]** (CUS). See **[Begin Acc round]** (tA1) page 167.	0 to 100%	10%
tA2 ★ ◯	**[End Acc round]** Rounding of end of acceleration ramp as a % of the **[Acceleration]** (ACC) or **[Acceleration 2]** (AC2) ramp time. Can be set between 0 and 100% - **[Begin Acc round]** (tA1). Visible if **[Ramp type]** (rPt) is set to **[Customized]** (CUS). See **[End Acc round]** (tA2) page 168.	0 to 100%	10%
tA3 ★ ◯	**[Begin Dec round]** Rounding of start of deceleration ramp as a % of the **[Deceleration]** (dEC) or **[Deceleration 2]** (dE2) ramp time. Visible if **[Ramp type]** (rPt) is set to **[Customized]** (CUS). See **[Begin Dec round]** (tA3) page 168.	0 to 100%	10%
tA4 ★ ◯	**[End Dec round]** Rounding of end of deceleration ramp as a % of the **[Deceleration]** (dEC) or **[Deceleration 2]** (dE2) ramp time. Can be set between 0 and 100% - **[Begin Dec round]** (tA3). Visible if **[Ramp type]** (rPt) is set to **[Customized]** (CUS). See **[End Dec round]** (tA4) page 168.	0 to 100%	10%
LSP ◯	**[Low speed]** Motor frequency at minimum reference, can be set between 0 and **[High speed]** (HSP) page 85. See **[Low speed]** (LSP) page 85.	0 to 599 Hz	0 Hz
HSP ◯	**[High speed]** Motor frequency at maximum reference, can be set between **[Low speed]** (LSP) and **[Max frequency]** (tFr). The factory setting changes to 60 Hz if **[Standard mot. freq]** (bFr) is set to **[60Hz NEMA]** (60). See **[High speed]** (HSP) page 85.	0 to 599 Hz	50 Hz

|	Parameters described in this page can be accessed by:		DRI- > CONF > FULL > SET-

Code	Name / Description	Adjustment range	Factory setting
H5P2 ★ ◯	**[High speed 2]** Visible if **[2 High speed]** (5H2) is not set to **[No]** (nO). See **[High speed 2]** (H5P2) page 241.	0 to 599 Hz	50 Hz
H5P3 ★ ◯	**[High speed 3]** Visible if **[4 High speed]** (5H4) is not set to **[No]** (nO). See **[High speed 3]** (H5P3) page 241.	0 to 599 Hz	50 Hz
H5P4 ★ ◯	**[High speed 4]** Visible if **[4 High speed]** (5H4) is not set to **[No]** (nO). See **[High speed 4]** (H5P4) page 241.	0 to 599 Hz	50 Hz
ItH ◯	**[Mot. therm. current]** Motor thermal protection current, to be set to the rated current indicated on the motor nameplate. See **[Mot. therm. current]** (ItH)page 85.	0.2 to 1.5 In (2)	According to drive rating
UFr ◯	**[IR compensation]** IR compensation. See **[IR comprensation]** (UFr) page 115.	0 to 200%	100%
5LP ★ ◯	**[Slip compensation]** Slip compensation. See **[Slip compensation]** (5LP) page 115.	0 to 300%	100%
5FC ★ ◯	**[K speed loop filter]** Speed filter coefficient. See **[K speed loop filter]** (5FC) page 115.	0 to 100	65
5It ★ ◯	**[Speed time integral]** Speed loop integral time constant. See **[Speed time integral]** (5It) page 115.	1 to 65,535 ms	63 ms
5PG ★ ◯	**[Speed prop. gain]** Speed loop proportional gain. See **[Speed prop. gain]** (5PG) page 115.	0 to 1,000%	40%
5PGU ★ ◯	**[UF inertia comp.]** Inertia factor. See **[UF inertia comp.]** (5PGU) page 115.	0 to 1,000%	40%

(1) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6,000 s according to **[Ramp increment]** (Inr) page 167.
(2) In corresponds to the rated drive current indicated in the Installation manual or on the drive nameplate.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
◯ Parameter that can be modified during operation or when stopped.

Parameter settings for [K speed loop filter] (5 F C), **[Speed prop. gain]** (5 P G) **and [Speed time integral]** (5 I t)

```
        ⚠ WARNING

LOSS OF CONTROL
Bad parameter settings of the speed loop with High Inertia application may cause a Ramp non consistent
with application.
Failure to follow these instructions will result in death, serious injury, or equipment damage.
```

The following parameters can be accessed if **[Motor control type]** (C t t) page 102 is set to **[SVC V]** (U U C),
[Sync. mot.] (5 Y n) or **[Energy Sav.]** (n L d).

General Case: Setting for [K speed loop filter] (5 F C) **= 0**

The regulator is an "IP" type with filtering of the speed reference, for applications requiring flexibility and
stability (hoisting or high inertia, for example).

- **[Speed prop. gain]** (5 P G) affects excessive speed.
- **[Speed time integral]** (5 I t) affects the passband and response time.
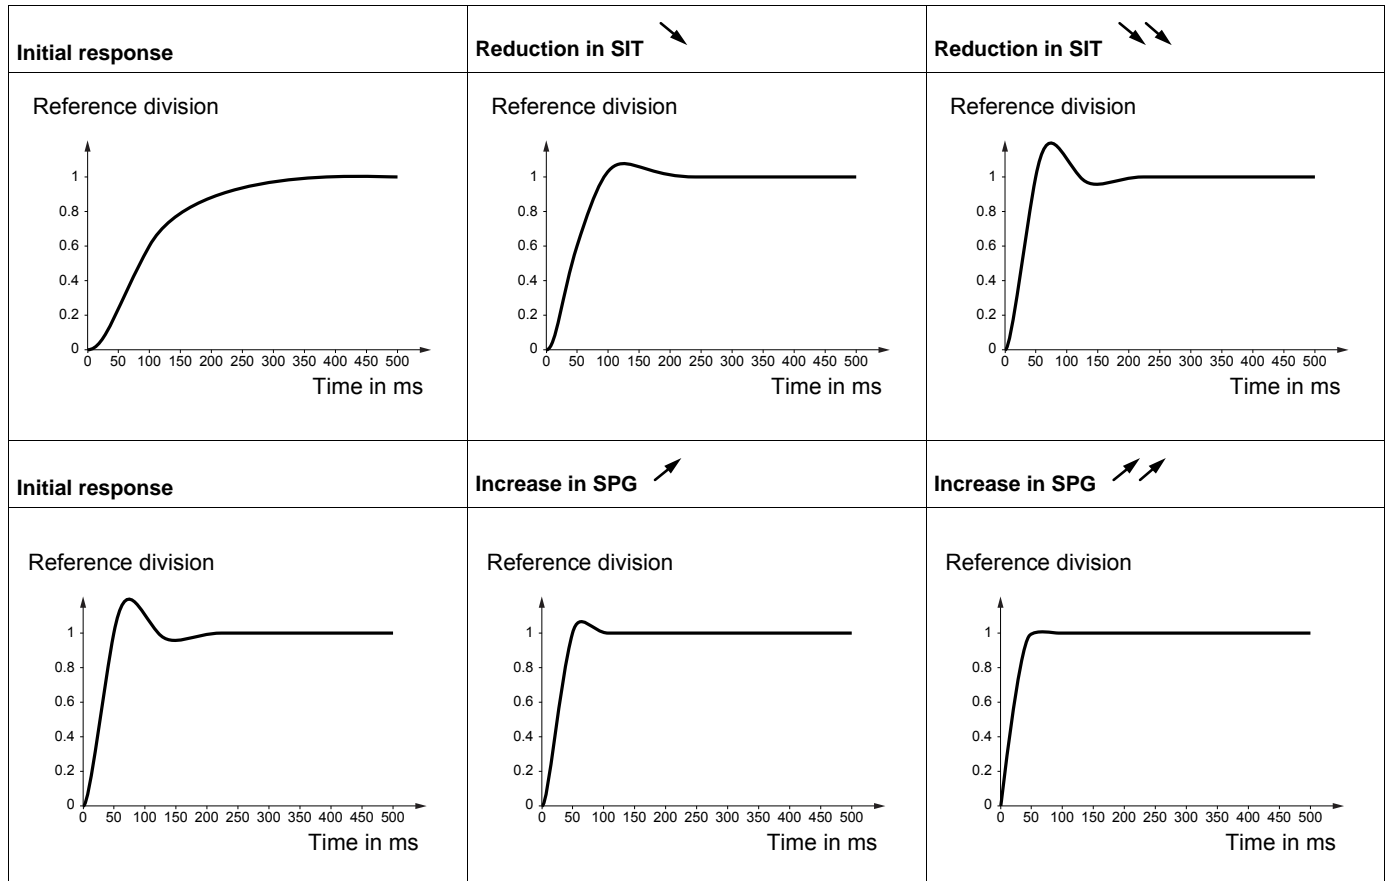

Special case: Parameter [K speed loop filter] (S F C) is not 0

This parameter must be reserved for specific applications that require a short response time (trajectory positioning or servo control).

- When set to 100 as described above, the regulator is a "PI" type, without filtering of the speed reference.
- Settings between 0 and 100 will obtain an intermediate function between the settings below and those on the previous page.

Example: Setting for [K speed loop filter] (S F C) = 100

- [Speed prop. gain] (S P G) affects the passband and response time.
- [Speed time integral] (S I t) affects excessive speed.

Initial response	Reduction in SIT ↘	Reduction in SIT ↘↘
Reference division	Reference division	Reference division
Initial response	Increase in SPG ↗	Increase in SPG ↗↗
Reference division	Reference division	Reference division

Configuration Mode (ConF)

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
dCF ★ ○	**[Ramp divider]** Deceleration ramp time reduction. See **[Ramp divider]** (dCF) page 170.	0 to 10	4
IdC ★ ○	**[DC inject. level 1]** Level of DC injection braking current activated via logic input or selected as stop mode. See **[DC inject. level 1]** (IdC) page 171.	0.1 to 1.41 In (1)	0.64 In (1)
td1 ★ ○	**[DC injection time 1]** Maximum current injection time **[DC inject. level 1]** (IdC). After this time, the injection current becomes **[DC inject. level 2]** (IdC2). See **[DC injection time 1]** (td1) page 171.	0.1 to 30 s	0.5 s
IdC2 ★ ○	**[DC inject. level 2]** Injection current activated by logic input or selected as stop mode, once period of time **[DC injection time 1]** (td1) has elapsed. See **[DC inject. level 2]** (IdC2) page 172.	0.1 In to 1.41 In (1)	0.5 In (1)
tdC ★ ○	**[DC injection time 2]** Maximum injection time **[DC inject. level 2]** (IdC2) for injection selected as stop mode only. See **[DC injection time 2]** (tdC) page 172.	0.1 to 30 s	0.5 s
SdC1 ★ ○	**[Auto DC inj. level 1]** **CAUTION** **RISK OF DAMAGE TO THE MOTOR** Check that the motor will withstand this current without overheating. **Failure to follow these instructions can result in equipment damage.** Level of standstill DC injection current **[Auto DC injection]** (AdC) is not **[No]** (nO). See page 173.	0 to 1.2 In (1)	0.7 In (1)
tdC1 ★ ○	**[Auto DC inj. time 1]** **CAUTION** **RISK OF DAMAGE TO THE MOTOR** • Long periods of DC injection braking can cause overheating and damage the motor. • Protect the motor by avoiding long periods of DC injection braking. **Failure to follow these instructions can result in equipment damage.** Standstill injection time. This parameter can be accessed if **[Auto DC injection]** (AdC) is not set to **[No]** (nO). If **[Motor control type]** (Ctt) page 102 is set to **[Sync. mot.]**(Syn), this time corresponds to the zero speed maintenance time. See page 173.	0.1 to 30 s	0.5 s

	Parameters described in this page can be accessed by:		DRI- > CONF > FULL > SET-

Code	Name / Description	Adjustment range	Factory setting
SdC2 ★ ⟳	**[Auto DC inj. level 2]**	0 to 1.2 In (1)	0.5 In (1)
	CAUTION **RISK OF DAMAGE TO THE MOTOR** Check that the motor will withstand this current without overheating. **Failure to follow these instructions can result in equipment damage.**		
	2nd level of standstill DC injection current. This parameter can be accessed if **[Auto DC injection]** (*AdC*) is not **[No]** (*nO*). See page 174.		
tdC2 ★ ⟳	**[Auto DC inj. time 2]**	0 to 30 s	0 s
	CAUTION **RISK OF DAMAGE TO THE MOTOR** • Long periods of DC injection braking can cause overheating and damage the motor. • Protect the motor by avoiding long periods of DC injection braking. **Failure to follow these instructions can result in equipment damage.**		
	2nd standstill injection time. This parameter can be accessed if **[Auto DC injection]** (*AdC*) is set to **[Yes]** (*YES*). See page 174.		
SFr ⟳	**[Switching freq.]**	2 to 16 kHz	4.0 kHz
	CAUTION **RISK OF DAMAGE TO THE DRIVE** On ATV32●●●●M2 ratings, if the RFI filters are disconnected (operation on an IT system), the drive's switching frequency must not exceed 4 kHz. **Failure to follow these instructions can result in equipment damage.**		
	Switching frequency setting. See page 116. **Adjustment range:** The maximum value is limited to 4 kHz if **[Motor surge limit]** (*SUL*) parameter, page 117 is configured. **Note:** In the event of excessive temperature rise, the drive will automatically reduce the switching frequency and reset it once the temperature returns to normal.		
CLI ★ ⟳	**[Current Limitation]**	0 to 1.5 In (1)	1.5 In (1)
	CAUTION **RISK OF DAMAGE TO THE MOTOR AND THE DRIVE** • Check that the motor will withstand this current, particularly in the case of permanent magnet synchronous motors, which are susceptible to demagnetization. • Check that the profile mission complies with the derating curve given in the installation manual. **Failure to follow these instructions can result in equipment damage.**		
	Used to limit the motor current. See page 215. **Note:** If the setting is less than 0.25 In, the drive may lock in **[Output Phase Loss]** (*OPL*) fault mode if this has been enabled (see page 253). If it is less than the no-load motor current, the motor cannot run.		

Configuration Mode (ConF)

	Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
CL2 ⭐ ⟳	**[I Limit. 2 value]**	0 to 1.5 In (1)	1.5 In (1)
	CAUTION **RISK OF DAMAGE TO THE MOTOR AND THE DRIVE** • Check that the motor will withstand this current, particularly in the case of permanent magnet synchronous motors, which are susceptible to demagnetization. • Check that the profile mission complies with the derating curve given in the installation manual. **Failure to follow these instructions can result in equipment damage.**		
	See page 215. **Note:** If the setting is less than 0.25 In, the drive may lock in **[Output Phase Loss]** (OPL) fault mode if this has been enabled (see page 253). If it is less than the no-load motor current, the motor cannot run.		
FLU ⭐ ⟳ ⏳ 2 s	**[Motor fluxing]**		**[No]** (FnO)
	⚠ ⚠ DANGER **HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH** When **[Motor fluxing]** (FLU) is set to **[Continuous]** (FCt), the drive automatically builds up flux. Check this action will not endanger personnel or equipment in any way. **Failure to follow these instructions will result in death or serious injury.**		
	CAUTION **RISK OF DAMAGE TO THE MOTOR** Check that the motor will withstand this current without overheating. **Failure to follow these instructions can result in equipment damage.**		
	The parameter is visible if **[Motor control type]** (Ctt) page 102 is not set to **[Sync. mot.]** (SYn). In order to obtain rapid high torque on startup, magnetic flux needs to already have been established in the motor. In **[Continuous]** (FCt) mode, the drive automatically builds up flux when it is powered up. In **[Not cont.]** (FnC) mode, fluxing occurs when the motor starts up. The flux current is greater than **[Rated mot. current]** (nCr) when the flux is established and is then adjusted to the motor magnetizing current. See page 186.		
FnC FCt FnO	**[Not cont.]** (FnC): Non-continuous mode **[Continuous]** (FCt): Continuous mode. This option is not possible if **[Auto DC injection]** (AdC) page 173 is **[Yes]** (YES) or if **[Type of stop]** (Stt) page 170 is **[Freewheel]** (nSt). **[No]** (FnO): Function inactive. This option is not possible if **[Brake assignment]** (bLC) page 191 is not **[No]** (nO).		
tLS ⟳	**[Low speed time out]**	0 to 999.9 s	0 s
	Maximum operating time at **[Low speed]** (LSP) (see page 85). Following operation at LSP for a defined period, a motor stop is requested automatically. The motor will restart if the reference is greater than LSP and if a run command is still present. See page 210. **Note:** A value of 0 indicates an unlimited period of time. **Note:** If **[Low speed time out]** (tLS) is not 0, **[Type of stop]** (Stt) page 170 is forced to **[Ramp stop]** (rMP) (only if a ramp stop can be configured).		
JGF ⭐ ⟳	**[Jog frequency]**	0 to 10 Hz	10 Hz
	Reference in jog operation. See page 175.		
JGt ⭐ ⟳	**[Jog delay]**	0 to 2.0 s	0.5 s
	Anti-repeat delay between 2 consecutive jog operations. See page 176.

ttr ★ ⟲	**[Time to restart]** Time between the end of a brake engage sequence and the start of a brake release sequence. See page 193.	0.00 to 15.00 s	0.00 s

Configuration Mode (ConF)

| **Parameters described in this page can be accessed by:** | | | DRI- > CONF > FULL > SET- |

Code	Name / Description	Adjustment range	Factory setting
ŁL IП ⭐ ⟲	**[Motoring torque lim]** Torque limitation in motor mode, as a % or in 0.1% increments of the rated torque in accordance with the **[Torque increment]** (I n Ł P) parameter, page 213. See page 213.	0 to 300%	100%
ŁL IG ⭐ ⟲	**[Gen. torque lim]** Torque limitation in generator mode, as a % or in 0.1% increments of the rated torque in accordance with the **[Torque increment]** (I n Ł P) parameter, page 213. See page 213.	0 to 300%	100%
Ł r H ⭐ ⟲	**[Traverse freq. high]** Traverse high. See page 239.	0 to 10 Hz	4 Hz
Ł r L ⭐ ⟲	**[Traverse freq. low]** Traverse low. See page 239.	0 to 10 Hz	4 Hz
9 S H ⭐ ⟲	**[Quick step High]** Quick step high. See page 239.	0 to **[Traverse freq. high]** (Ł r H)	0 Hz
9 S L ⭐ ⟲	**[Quick step Low]** Quick step low. See page 239.	0 to **[Traverse freq. low]** (Ł r L)	0 Hz
C Ł d ⟲	**[Current threshold]** Current threshold for **[I attained]** (C Ł A) function assigned to a relay or a logic output (see page 135). See page 249.	0 to 1.5 In (1)	In (1)
Ł Ł H ⟲	**[High torque thd.]** High torque threshold for **[High tq. att.]** (Ł Ł H A) function assigned to a relay or a logic output (see page 135), as a % of the rated motor torque. See page 249.	-300% to +300%	100%
Ł Ł L ⟲	**[Low torque thd.]** Low torque threshold for **[Low tq. att.]** (Ł Ł L A) function assigned to a relay or a logic output (see page 135), as a % of the rated motor torque. See page 249.	-300% to +300%	50%
F 9 L ⭐	**[Pulse warning thd.]** Speed threshold measured by the **[FREQUENCY METER]** (F 9 F -) function, page 263, assigned to a relay or a logic output (see page 135). See page 250.	0 Hz to 20,000 kHz	0 Hz
F Ł d ⟲	**[Freq. threshold]** Motor frequency threshold for **[Freq.Th.att.]** (F Ł A) function assigned to a relay or a logic output (see page 135), or used by the **[PARAM. SET SWITCHING]** (П L P -) function, page 227. See page 249.	0.0 to 599 Hz	HSP
F 2 d ⟲	**[Freq. threshold 2]** Motor frequency threshold for **[Freq. th.2 attained]** (F 2 A) function assigned to a relay or a logic output (see page 135), or used by the **[PARAM. SET SWITCHING]** (П L P -) function, page 227. See page 249.	0.0 to 599 Hz	HSP
F F Ł ⭐ ⟲	**[Freewheel stop Thd]** Speed threshold below which the motor will switch to freewheel stop. This parameter supports switching from a ramp stop or a fast stop to a freewheel stop below a low speed threshold. It can be accessed if **[Type of stop]** (5 Ł Ł) is set to **[Fast stop]** (F 5 Ł) or **[Ramp stop]** (r П P) and if **[Brake assignment]** (b L C) or **[Auto DC injection]** (A d C) are configured. See page 170.	0.2 to 599 Hz	0.2 Hz

Parameters described in this page can be accessed by: DRI- > CONF > FULL > SET-

Code	Name / Description	Adjustment range	Factory setting
t t d	**[Motor therm. level]**	0 to 118%	100%
	Trip threshold for motor thermal alarm (logic output or relay). See page 252.		
JPF	**[Skip Frequency]**	0 to 599 Hz	0 Hz
	Skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive. See page 179.		
JF2	**[Skip Frequency 2]**	0 to 599 Hz	0 Hz
	2nd skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive. See page 180.		
JF3	**[3rd Skip Frequency]**	0 to 599 Hz	0 Hz
	3rd skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive. See page 180.		
JFH	**[Skip.Freq.Hysteresis]**	0.1 to 10 Hz	1 Hz
	Parameter visible if at least one skip frequency **[Skip Frequency]** (JPF), **[Skip Frequency 2]** (JF2) or **[3rd Skip Frequency]** (JF3) is different from 0. Skip frequency range: between (JPF − JFH) and (JPF + JFH) for example. This adjustment is common to the 3 frequencies (JPF, JF2, JF3). See page 180.		
LUn	**[Unld.Thr.Nom.Speed]**	20 to 100% of **[Rated mot. current]** (nCr)	60%
	Underload threshold at rated motor frequency (**[Rated motor freq.]** (Fr5) page 84), as a % of the rated motor torque. Visible only if **[Unld T. Del. Detect]** (ULt) page 267 is not set to 0. See page 267.		
LUL	**[Unld.Thr.0.Speed]**	0 to **[Unld.Thr.Nom.Speed]** (LUn)	0%
	Underload threshold at zero frequency, as a % of the rated motor torque. Visible only if **[Unld T. Del. Detect]** (ULt) page 267 is not set to 0. See page 267.		
rMUd	**[Unld. Freq.Thr. Det.]**	0 to 599 Hz	0 Hz
	Underload detection minimum frequency threshold. See page 267.		
Srb	**[Hysteresis Freq.Att.]**	0.3 to 599 Hz	0.3 Hz
	Maximum deviation between the frequency reference and the motor frequency, which defines steady state operation. See page 267.		
FtU	**[Underload T.B.Rest.]**	0 to 6 min	0 min
	Minimum time permitted between an underload being detected and any automatic restart. In order for an automatic restart to be possible, the value of **[Max. restart time]** (tAr) page 249 must exceed that of this parameter by at least one minute. See page 268.		
LOC	**[Ovld Detection Thr.]**	70% to 150% of **[Rated mot. current]** (nCr)	110%
	Overload detection threshold, as a % of the rated motor current **[Rated mot. current]** (nCr). This value must be less than the limit current in order for the function to work. See page 269. Visible only if **[Ovld Time Detect.]** (tOL) is not set to 0. This parameter is used to detect an "application overload". This is not a motor or drive thermal overload.		
FtO	**[Overload T.B.Rest.]**	0 to 6 min	0 min
	Minimum time permitted between an overload being detected and any automatic restart. In order for an automatic restart to be possible, the value of **[Max. restart time]** (tAr) page 249 must exceed that of this parameter by at least one minute. See page 269.

Code	Name / Description	Adjustment range	Factory setting
L b C ★ ()	**[Load correction]** Rated correction in Hz. See **[Load correction]** (L b C) page 119.	0 to 599 Hz	0 Hz
F F Π ()	**[Fan Mode]**		**[Standard]** (S t d)

<div style="border:1px solid">

CAUTION

RISK OF EQUIPMENT DAMAGE

If **[Fan Mode]** (F F Π) is set to **[Never]** (S t P), the fan of the drive will not be active.

Life time of Electronic component will be reduced.

Check that the ambient temperature will be limited to 40°C.

Failure to follow these instructions can result in equipment damage.

</div>

Code	Name / Description	Adjustment range	Factory setting
S t d r U n S t P	**[Standard]** (S t d): The fan starts and stops automatically according to the drive thermal state **[Always]** (r U n): The fan is started **[Never]** (S t P): The fan is stopped		
S d S ()	**[Scale factor display]**	0.1 to 200	30

Used to display a value in proportion to the output frequency [Output frequency] (r F r): the machine speed, the motor speed, etc.

The display will show

$$[\text{Cust. output value}]\ (SPd3) = \frac{[\text{Scale factor display}]\ (SdS)\ \text{x}\ [\text{Output frequency}]\ (rFr)}{1000}\ \text{to 2 decimal places}$$

- If [Scale factor display] (S d S) ⩽ 1, [Cust. output value] (S P d 1) is displayed (possible definition = 0.01)
- If 1 < [Scale factor display] (S d S) ⩽ 10, [Cust. output value] (S P d 2) is displayed (possible definition = 0.1)
- If [Scale factor display] (S d S) > 10, [Cust. output value] (S P d 3) is displayed (possible definition = 1)
- If [Scale factor display] (S d S) > 10 and [Scale factor display] (S d S) x [Output frequency] (r F r) > 9,999:

  example: for 24,223, display will show 24.22

    - If [Scale factor display] (S d S) > 10 and [Scale factor display] (S d S) x [Output frequency] (r F r) > 65,535, display locked at 65.54

    Example: Display motor speed for
    4-pole motor, 1,500 rpm at 50 Hz (synchronous speed):
    [Scale factor display] (S d S) = 30
    [Cust. output value] (S P d 3) = 1,500 at [Output frequency] (r F r) = 50 Hz

(1) In corresponds to the rated drive current indicated in the Installation manual or on the drive nameplate.

(2) If a graphic display terminal is not in use, values greater than 9,999 will be displayed on the 4-digit display with a period mark after the thousand digit, example: 15.65 for 15,650.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
() Parameter that can be modified during operation or when stopped.

⧗ 2 s To change the assignment of this parameter, press the ENT key for 2 s.

Parameters described in this page can be accessed by:	
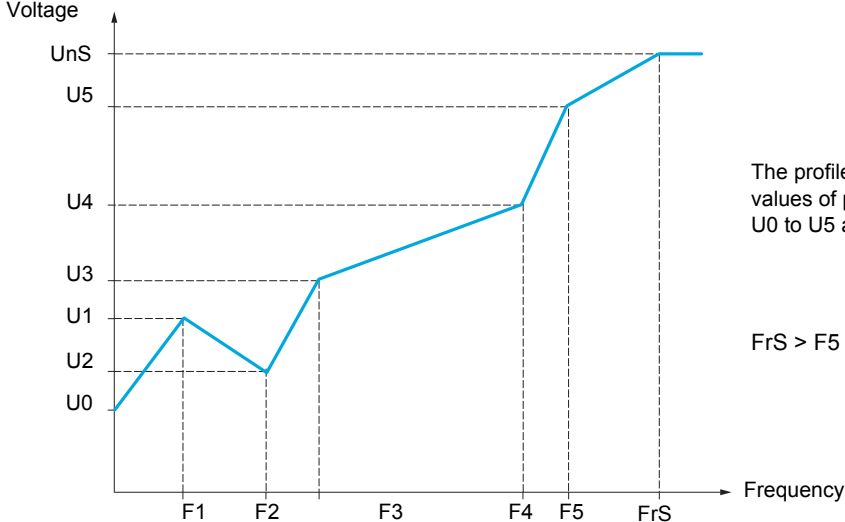

Motor control

The parameters in the **[MOTOR CONTROL]** (d r C -) menu can only be modified when the drive is stopped and no run command is present, with the following exceptions:

- **[Auto tuning]** (t U n) page 110, which may cause the motor to start up.
- Parameters containing the sign ( ) in the code column, which can be modified with the drive running or stopped.

Note : We recommend to perform auto-tuning if one of the following parameters are modified from their factory setting.

Code	Name / Description	Adjustment range	Factory setting
FULL	**[FULL]** (continued)		
drC -	**[MOTOR CONTROL]**		
bFr	**[Standard mot. freq]**		**[50 Hz IEC]** (5 0)
	This parameter modifies the presets of the following parameters: **[High speed]** (H 5 P) page 85, **[Freq. threshold]** (F t d) page 99, **[Rated motor volt.]** (U n 5), **[Rated motor freq.]** (F r 5) and **[Max frequency]** (t F r).		
5 0 6 0	**[50 Hz IEC]** (5 0): IEC **[60 Hz NEMA]** (6 0): NEMA		
tFr	**[Max frequency]**	10 to 599 Hz	60 Hz
	The factory setting is 60 Hz, or preset to 72 Hz if **[Standard mot. freq]** (b F r) is set to 60 Hz. The maximum value is limited by the following conditions: It must not exceed 10 times the value of **[Rated motor freq.]** (F r 5).		
Ctt	**[Motor control type]**		**[Standard]** (5 t d)
	Note: Select law before entering parameter values.		
UUC	**[SVC V]** (U U C): Sensorless vector control with internal speed loop based on voltage feedback calculation. For applications needing high performance during starting or operation.		
5td	**[Standard]** (5 t d): Standard motor law. For simple applications that do not require high performance. Simple motor control law keeping a constant Voltage Frequency ratio, with a possible adjustment of the curve bottom. This law is generally used for motors connected in parallel. Some specific applications with motors in parallel and high performance levels may require **[SVC V]** (U U C). **Note:** U0 is the result of an internal calculation based on motor parameters and multiplied by UFr (%). U0 can be adjusted by modifying UFr value.		

Parameters described in this page can be accessed by:			DRI- > CONF > FULL > DRC-

Code	Name / Description	Adjustment range	Factory setting
UF5	**[V/F 5pts]** (UF5): 5-segment V/F profile: As **[Standard]** (Std) profile but also supports the avoidance of resonance (saturation). The profile is defined by the values of parameters UnS, FrS, U0 to U5 and F1 to F5. FrS > F5 > F4 > F3 > F2 > F1 **Note:** U0 is the result of an internal calculation based on motor parameters and multiplied by UFr (%). U0 can be adjusted by modifying UFr value.		
SYn	**[Sync. mot.]** (SYn): For synchronous permanent magnet motors with sinusoidal electromotive force (EMF) only. This selection makes the asynchronous motor parameters inaccessible, and the synchronous motor parameters accessible.		
UF9	**[V/F Quad.]** (UF9): Variable torque. For pump and fan applications.		
nLd	**[Energy Sav.]** (nLd): Energy saving. For applications that do not require high dynamics.		

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > DRC- > ASY-

Asynchronous motor parameters

Code	Name / Description	Adjustment range	Factory setting
A 5 Y -	**[ASYNC. MOTOR]** Only visible if **[Motor control type]** (C t t) page 102 is not set to **[Sync. mot.]** (5 Y n).		
n P r ★	**[Rated motor power]** This parameter cannot be accessed if **[Motor control type]** (C t t) page 102 is set to **[Sync. mot.]** (5 Y n). Rated motor power given on the nameplate, in kW if **[Standard mot. freq]** (b F r) is set to **[50Hz IEC]** (5 0), in HP if **[Standard mot. freq]** (b F r) is set to **[60Hz NEMA]** (6 0).	According to drive rating	According to drive rating
C O 5 ★	**[Motor 1 Cosinus Phi]** Nominal motor cos phi. This parameter can be accessed if **[Motor param choice]** (n P C) is set to **[Mot Cos]** (C O 5).	0.5 to 1	According to drive rating
U n 5 ★	**[Rated motor volt.]** This parameter cannot be accessed if **[Motor control type]** (C t t) page 102 is set to **[Sync. mot.]** (5 Y n). Rated motor voltage given on the nameplate.	100 to 480 V	According to drive rating and **[Standard mot. freq]** (b F r)
n C r ★	**[Rated mot. current]** This parameter cannot be accessed if **[Motor control type]** (C t t) page 102 is set to **[Sync. mot.]** (5 Y n). Rated motor current given on the nameplate.	0.25 to 1.5 In (1)	According to drive rating and **[Standard mot. freq]** (b F r)
F r 5 ★	**[Rated motor freq.]** This parameter cannot be accessed if **[Motor control type]** (C t t) page 102 is set to **[Sync. mot.]** (5 Y n). Rated motor frequency given on the nameplate. The factory setting is 50 Hz, or preset to 60 Hz if **[Standard mot. freq]** (b F r) is set to 60 Hz.	10 to 800 Hz	50 Hz
n 5 P ★	**[Rated motor speed]** This parameter cannot be accessed if **[Motor control type]** (C t t) page 102 is set to **[Sync. mot.]** (5 Y n). 0 to 9,999 rpm then 10.00 to 65.53 krpm on the integrated display terminal. If, rather than the rated speed, the nameplate indicates the synchronous speed and the slip in Hz or as a %, calculate the rated speed as follows: Nominal speed = Synchronous speed x $\dfrac{100 - \text{slip as a \%}}{100}$ or Nominal speed = Synchronous speed x $\dfrac{50 - \text{slip in Hz}}{50}$ (50 Hz motors) or Nominal speed = Synchronous speed x $\dfrac{60 - \text{slip in Hz}}{60}$ (60 Hz motors).	0 to 65,535 rpm	According to drive rating

Code	Name / Description	Adjustment range	Factory setting
tUn ⟳ ⏳ 2 s	**[Auto tuning]** ⚠⚠ **DANGER** **HAZARD OF ELECTRIC SHOCK OR ARC FLASH** • During auto-tuning, the motor operates at rated current. • Do not service the motor during auto-tuning. **Failure to follow these instructions will result in death or serious injury.** ⚠ **WARNING** **LOSS OF CONTROL** • It is essential that the following parameters **[Rated motor volt.]** (*Un5*), **[Rated motor freq.]** (*Fr5*), **[Rated mot. current]** (*nCr*), **[Rated motor speed]** (*nSP*), and **[Rated motor power]** (*nPr*) or **[Motor 1 Cosinus Phi]** (*CO5*) are correctly configured before starting auto-tuning. • When one or more of these parameters have been changed after auto-tuning has been performed, **[Auto tuning]** (*tUn*) will return **[No action]** (*nO*) and the procedure will have to be repeated. **Failure to follow these instructions can result in death, serious injury, or equipment damage.** - Auto-tuning is only performed if no stop command has been activated. If a "freewheel stop" or "fast stop" function has been assigned to a logic input, this input must be set to 1 (active at 0). - Auto-tuning takes priority over any run or prefluxing commands, which will be taken into account after the auto-tuning sequence. - If auto-tuning detects a fault, the drive displays **[No action]** (*nO*) and, depending on the configuration of **[Autotune fault mgt]** (*tnL*) page 265, may switch to **[Auto-tuning]** (*tnF*) fault mode. - Auto-tuning may last for 1 to 2 seconds. Do not interrupt the process. Wait for the display to change to **[No action]** (*nO*). **Note:** Motor thermal state has a big influence on tune result. Make the tune with the motor stopped and cold. To redo a tune of the motor, wait that it is completely stopped and cold. Set first **[Auto tuning]** (*tUn*) to **[Erase tune]** (*CLr*), then redo the motor tuning. The use of the motor tuning without doing a **[Erase tune]** (*CLr*) first is used to get the thermal state estimation of the motor. In any case, the motor has to be stopped before performing a tune operation. Cable length has an influence on the Tune result. If the cabling is modified, it is necessary to redo the tune operation.		**[No]** (*nO*)
nO *YES* *CLr*	**[No action]** (*nO*): Auto-tuning not in progress **[Do tune]** (*YES*): Auto-tuning is performed immediatly if possible, then the parameter automatically changes to **[No action]** (*nO*). If the drive state does not allow the tune operation immediately, the parameter changes to **[No]** (*nO*) and the operation must be done again. **[Erase tune]** (*CLr*): The motor parameters measured by the auto-tuning function are reseted. The default motor parameters values are used to control the motor. **[Auto tuning status]** (*tUS*) is set to **[Not done]** (*tAb*).		
tUS	**[Auto tuning state]** (for information only, cannot be modified) This parameter is not saved at drive power off. It shows the Autotuning status since last power on.		**[Not done]** (*tAb*)
tAb *PEnd* *PrOG* *FAIL* *dOnE*	**[Not done]** (*tAb*): Autotune is not done **[Pending]** (*PEnd*): Autotune has been requested but not yet performed **[In Progress]** (*PrOG*): Autotune is in progress **[Failed]** (*FAIL*): Autotune has detected a fault **[Done]** (*dOnE*): The motor parameters measured by the auto-tuning function are used to control the motor		
StUn	**[Tune selection]** (for information only, cannot be modified)		**[Default]** (*tAb*)
tAb *MEAS* *CUS*	**[Default]** (*tAb*): The default values are used to control the motor **[Measure]** (*MEAS*): The values measured by the auto-tuning function are used to control the motor **[Custom]** (*CUS*): The values set manually are used to control the motor **Note:** Tune of the motor will increase significantly the performances.		

Code	Name / Description	Adjustment range	Factory setting

Code	Name / Description	Adjustment range	Factory setting
ŁUnU	**[Auto tuning usage]**		**[Therm Mot]** (ŁΠ)
	This parameter shows the way used to modify the motor parameters according to its estimated thermal state.		
nO ŁΠ ĿŁ	**[No]** (nO): No thermal state estimation **[Therm Mot]** (ŁΠ): Statoric thermal state estimation based on nominal current and current consumed by the motor **[Cold tun]** (ĿŁ): Statoric thermal state estimation based on statoric resistance measured at the first cold tune and tune done at each power up		
AUŁ ○ ⧖ 2 s	**[Automatic autotune]**		**[No]** (nO)

<div style="border:2px solid black; background:black; color:white; text-align:center; font-weight:bold;">⚠ ⚠ DANGER</div>

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH
When **[Automatic autotune]** (AUŁ) is changed from **[No]** (nO), Autotune will be performed every time the power will be switched on.
Check this action will not endanger personnel or equipment in any way.
Failure to follow these instructions will result in death or serious injury.

The motor must be stopped when switching on the drive.
[Automatic autotune] (AUŁ) is forced to **[Yes]** (YES) if **[Auto tuning usage]** (ŁUnU) is set to **[Cold tun]** (ĿŁ). The value of motor statoric resistance measured during the tune is used to estimate the thermal state of the motor at power up.

Code	Name / Description	Adjustment range	Factory setting
nO YES	**[No]** (nO): Function deactivated **[Yes]** (YES): A tune is automatically done at each power up		
FLU ★ ○ (1) ⧖ 2 s	**[Motor fluxing]**		**[No]** (FnO)

<div style="border:2px solid black; background:black; color:white; text-align:center; font-weight:bold;">⚠ ⚠ DANGER</div>

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH
When **[Motor fluxing]** (FLU) is set to **[Continuous]** (FĿŁ), the drive automatically builds up flux.
Check this action will not endanger personnel or equipment in any way.
Failure to follow these instructions will result in death or serious injury.

<div style="border:2px solid black; text-align:center; font-weight:bold; font-size:large;">CAUTION</div>

RISK OF DAMAGE TO THE MOTOR
Check that the motor will withstand this current without overheating.
Failure to follow these instructions can result in equipment damage.

If **[Motor control type]** (ĿŁŁ) page 102 is set to **[Sync. mot.]** (SYn), the factory setting is replaced by **[Not cont.]** (FnĿ).
In order to obtain rapid high torque on startup, magnetic flux needs to already have been established in the motor.
In **[Continuous]** (FĿŁ) mode, the drive automatically builds up flux when it is powered up.
In **[Not cont.]** (FnĿ) mode, fluxing occurs when the motor starts up.
The flux current is greater than **[Rated mot. current]** (nĿr) (configured rated motor current) when the flux is established and is then adjusted to the motor magnetizing current.

Code	Name / Description	Adjustment range	Factory setting
FnĿ FĿŁ FnO	**[Not cont.]** (FnĿ): Non-continuous mode **[Continuous]** (FĿŁ): Continuous mode. This option is not possible if **[Auto DC injection]** (AdĿ) page 173 is **[Yes]** (YES) or if **[Type of stop]** (SŁŁ) page 170 is **[Freewheel]** (nSŁ). **[No]** (FnO): Function inactive. This option is not possible if **[Brake assignment]** (bLĿ) page 191 is not **[No]** (nO).		

If **[Motor control type]** (ĿŁŁ) page 102 is set to **[Sync. mot.]** (SYn), the **[Motor fluxing]** (FLU) parameter causes the alignment of the rotor and not the fluxing.
If **[Brake assignment]** (bLĿ) page 191 is not **[No]** (nO), the **[Motor fluxing]** (FLU) parameter has no effect.

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > DRC- > SYN-

Synchronous motor parameters

These parameters can be accessed if **[Motor control type]** (*C t t*) page 102 is set to **[Sync. mot.]** (*5 Y n*). In this case, the asynchronous motor parameters cannot be accessed.

Once the drive is chosen:

1- Enter the motor nameplate.

2 - Perform the tune.

- Do an [Auto tuning] (*t U n*)
- Check the state of the synchronous motor saliency (See page 110.)

If [Saliency mot. state] (*5 Π O t*) displays [Med salient] (*Π L 5*) or [High salient] (*H L 5*)
     - follow the procedure below "**3 - Improve the tune result**"
       and
     - follow the the procedure below "**4 - Adjust PHS**"
Or if [Saliency mot. state] (*5 Π O t*) displays [Low salient] (*L L 5*)
     - follow the the procedure below "**4 - Adjust PHS**"

3 - Improve the tune results.

CAUTION
RISK OF DAMAGE TO THE MOTOR AND THE DRIVE
• Check that the motor will withstand this current, particularly in the case of permanent magnet synchronous motors, which are susceptible to demagnetization. • Check that the profile mission complies with the derating curve given in the installation manual. **Failure to follow these instructions can result in equipment damage.**

- Set [PSI align curr. max] (*Π C r*) conforming to the maximum motor current. The maximum value of [PSI align curr. max] (*Π C r*)) is limited by [Current Limitation] (*C L I*). Without information set [PSI align curr. max] (*Π C r*) to [Auto] (*A U t O*) (see page 113)
- Do a second (*t U n*) after the (*Π C r*) modification.

4 - Adjust PHS.

Adjust [Syn. EMF constant] (*P H 5*) to have optimal behavior (See page 113.)
- Start the motor at minimal stable frequency available on the machine (without load).
- Check and note the [% error EMF sync] (*r d A E*) value. (See page 114)
    - If the [% error EMF sync] (*r d A E*) value is lower than 0%, then [Syn. EMF constant] (*P H 5*) may be increased.
    - If the [% error EMF sync] (*r d A E*) value is upper than 0%, then [Syn. EMF constant] (*P H 5*) may be reduced.
[% error EMF sync] (*r d A E*) value should be closed to 0%.
- Stop the motor for modify *P H 5* in accordance with the value of the *r d A E* (previously noted).

Advices:
The drive must be chosen to have enough current according to the need of behavior, but not too much, to have enough accuracy in the current measurement, especially with the high frequency signal injection (see **[HF inj. activation]** (*H F I*) page 113).
Performances may be higher on high saliency motors by activating high frequency injection function (see **[HF inj. activation]** (*H F I*) page 113).

⚠ ⚠ DANGER

HAZARD OF ELECTRIC SHOCK OR ARC FLASH
• During auto-tuning, the motor operates at rated current.
• Do not service the motor during auto-tuning.
Failure to follow these instructions will result in death or serious injury.

⚠ WARNING

LOSS OF CONTROL
• It is essential that the following parameters **[Nominal I sync.]** (nCrS), **[Nom motor spdsync]** (nSPS), **[Pole pairs]** (PPnS), **[Syn. EMF constant]** (PHS), **[Autotune L d-axis]** (LdS) and **[Autotune L q-axis]** (LqS) are correctly configured before starting auto-tuning.
• When one or more of these parameters have been changed after auto-tuning has been performed, **[Auto tuning]** (tUn) will return **[No action]** (nO) and the procedure will have to be repeated.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

- Auto-tuning is only performed if no stop command has been activated. If a "freewheel stop" or "fast stop" function has been assigned to a logic input, this input must be set to 1 (active at 0).
- Auto-tuning takes priority over any run or prefluxing commands, which will be taken into account after the auto-tuning sequence.
- If auto-tuning detects a fault, the drive displays **[No action]** (nO) and, depending on the configuration of **[Autotune fault mgt]** (tnL) page 265, may switch to **[Auto-tuning]** (tnF) fault mode.
- Auto-tuning may last for 1 to 2 seconds. Do not interrupt the process. Wait for the display to change to **[No action]** (nO).

Note: Motor thermal state has a big influence on tune result. Make the tune with the motor stopped and cold.
To redo a tune of the motor, wait that it is completely stopped and cold. Set first **[Auto tuning]** (tUn) to **[Erase tune]** (CLr), then redo the motor tuning.
The use of the motor tuning without doing a **[Erase tune]** (CLr) first is used to get the thermal state estimation of the motor. In any case, the motor has to be stopped before performing a tune operation.
Cable length has an influence on the Tune result. If the cabling is modified, it is necessary to redo the tune operation.

nO — **[No action]** (nO): Auto-tuning not in progress
YES — **[Do tune]** (YES): Auto-tuning is performed immediately if possible, then the parameter automatically changes to **[No action]** (nO). If the drive state does not allow the tune operation immediately, the parameter changes to **[No]** (nO) and the operation must be done again.
CLr — **[Erase tune]** (CLr): The motor parameters measured by the auto-tuning function are reseted. The default motor parameters values are used to control the motor. **[Auto tuning status]** (tUS) is set to **[Not done]** (tAb).

Code	Name / Description		Adjustment range	Factory setting
A S t ★	**[Angle setting type]**			**[PSIO align.]** (*P S I O*)
	Mode for measuring the phase-shift angle. Visible only if **[Motor control type]** (*C t t*) is set to **[Sync. mot.]** (*S Y n*). **[PSI align]** (*P S I*) and **[PSIO align]** (*P S I O*) are working for all type of synchronous motors. **[SPM align]** (*S P M A*) and **[IPM align]** (*I P M A*) increase performances depending on the type of synchronous motor.			
I P M A	**[IPM align]** (*I P M A*): Alignment for IPM motor. Alignment mode for Interior-buried Permanent Magnet motor (usually, this kind of motor has a high saliency level). It uses high frequency injection, which is less noisy than standard alignment mode.			
S P M A	**[SPM align]** (*S P M A*): Alignment for SPM motor. Mode for Surface-mounted Permanent Magnet motor (usually, this kind of motor has a medium or low saliency level). It uses high frequency injection, which is less noisy than standard alignment mode.			
P S I	**[PSI align]** (*P S I*): Pulse signal injection. Standard alignment mode by pulse signal injection.			
P S I O	**[PSIO align]** (*P S I O*): Pulse signal injection - Optimized. Standard optimized alignment mode by pulse signal injection. The phase shift angle measurement time is re			
n O	duced after the first run order or tune operation, even if the drive has been turned off. **[No align]** (*n O*): No alignment			
H F I ★	**[HF inj. activation]**			**[No]** (*n O*)
	Activation of high frequency signal injection in RUN. This function allows to estimate the motor speed in a view to have torque at low speed without speed feedback. **Note:** The more the saliency is high, the more the **[HF inj. activation]** (*H F I*) function will be efficient. In order to ensure the performances, it could be necessary to adjust the speed loop parameters (**[K speed loop filter]** (*S F C*), **[Speed time integral]** (*S I t*) and **[Speed prop. gain]** (*S P G*), see page 115) and the speed estimation phase locked loop (Expert parameters **[HF pll bandwith]** (*S P b*) and **[HF pll dump. factor]** (*S P F*), see page 113). High frequency injection is not efficient with low saliency motors (see **[Saliency mot. state]** (*S M O t*) page 111). It is advised to have 4 kHz of pwm frequency (**[Switching freq.]** (*S F r*)). In case of instability with no load, it is advised to decrease **[Speed prop. gain]** (*S P G*) and **[HF pll bandwith]** (*S P b*). Then, adjust the speed loop parameters to have the dynamic behavior and the PLL gains to have a good speed estimation at low speed. In case of instability with load, it could help to increase the **[Angle error Comp.]** (*P E C*) parameter (mainly for SPM motor).			
n O *Y E S*	**[No]** (*n O*): Function deactivated **[Yes]** (*Y E S*): High frequency injection is used for speed estimation			

(1) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.
(2) On the integrated display unit: 0 to 9,999 then 10.00 to 65.53 (10,000 to 65,536).

Synchronous motor: Expert mode

| Code	Name / Description	Adjustment range	Factory setting
SYN-	**[SYNCHRONOUS MOTOR]**		
rSAS ★ ○ (1)	**[Cust. stator R syn]** Cold state stator resistance (per winding). The factory setting is replaced by the result of the auto-tuning operation, if it has been performed. The value can be entered by the user, if he knows it.	0 to 65,535 mOhm	0 mOhm
LdS ★	**[Autotune L d-axis]** Axis "d" stator inductance in mH (per phase). On motors with smooth poles **[Autotune L d-axis]** (*LdS*) = **[Autotune L q-axis]** (*LqS*) = Stator inductance L. The factory setting is replaced by the result of the auto-tuning operation, if it has been performed.	0 to 655.35 mH	0 mH
LqS ★	**[Autotune L q-axis]** Axis "q" stator inductance in mH (per phase). On motors with smooth poles **[Autotune L d-axis]** (*LdS*) = **[Autotune L q-axis]** (*LqS*) = Stator inductance L. The factory setting is replaced by the result of the auto-tuning operation, if it has been performed.	0 to 655.35 mH	0 mH
PHS ★ (1)	**[Syn. EMF constant]** Synchronous motor EMF constant, in mV per rpm (peak voltage per phase). PHS adjustment allows to reduce the current in operation without load.	0 to 6,553.5 mV/rpm	0 mV/rpm
FrSS ★ ○	**[Nominal freq sync.]** Nominal motor frequency for synchronous motor in Hz unit. Automatically updated according to **[Nom motor spdsync]** (*nSPS*) and **[Pole pairs]** (*PPnS*) data.	10 to 800 Hz	nSPS * PPnS / 60
SPb ★	**[HF pll bandwith]** Bandwidth of the stator frequency PII.	0 to 100 Hz	25 Hz
SPF ★	**[HF pll dump. factor]** Dumping factor of the stator frequency PII.	0 to 200%	100%
PEC ★ AUTO	**[Angle error Comp.]** Error compensation of the angle position in high frequency mode. It increases performances at low speed in generator and motor mode, particularly for SPM motors. **[Auto]** (*AUTO*): The drive takes a value equal to the rated slip of the motor, calculated using the drive parameters.	0 to 500%	0%
Fr1 ★	**[HF injection freq.]** Frequency of the high frequency injection signal. It has an influence on the noise during angle shift measurement and speed estimation accuracy.	250 to 1,000 Hz	500 Hz
H1r ★	**[HF current level]** Ratio for the current level of the high frequency injection signal. It has an influence on the noise during angle shift measurement and speed estimation accuracy.	0 to 200%	25%
MCr ★	**[PSI align curr. max]** Current level in % of **[Nominal I sync.]** (*nCrS*) for **[PSI align]** (*PS1*) and **[PSIO align]** (*PS1O*) angle shift measurement modes. This parameter has an impact on the inductor measurement. **[PSI align curr. max]** (*MCr*) is used for tune operation. This current must be equal or higher than the maximum current level of the application, otherwise instability may occur. If **[PSI align curr. max]** (*MCr*) is set to **[Auto]** (*AUTO*), **[PSI align curr. max]** (*MCr*) = 150% of **[Nominal I sync.]** (*nCrS*) during the tune operation and 100% of **[Nominal I sync.]** (*nCrS*) during angle shift measurement in case of standard alignment (**[PSI align]** (*PS1*) or **[PSIO align]** (*PS1O*)).	**[Auto]** (*AUTO*) to 300%	**[Auto]** (*AUTO*)
ILr ★	**[Injection level align]** Current level in % of **[Nominal I sync.]** (*nCrS*) for high frequency phase-shift angle measurement IPMA type.	0 to 200%	50%

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
S I r ★	**[Boost level align.]** Current level in % of **[Nominal I sync.]** (nCrS) for high frequency phase-shift angle measurement SPMA type.	0 to 200%	100%
r d A E	**[% error EMF sync]** Ratio D-Axis Current Use r d A E to asjust **[Syn. EMF constant]** (PHS), r d A E should be closed to 0. If the [% error EMF sync] (r d A E) value is lower than 0%, then **[Syn. EMF constant]** (PHS), may be increased. If the [% error EMF sync] (r d A E) value is upper than 0%, then **[Syn. EMF constant]** (PHS), may be reduced.	-3276.7 to 3275.8 %	-

(1) On the integrated display unit: 0 to 9,999 then 10.00 to 65.53 (10,000 to 65,536).

★ These parameters only appear if the corresponding function has been selected in another menu. () Parameter that can be modified during operation or when stopped.

Code	Name / Description	Adjustment range	Factory setting
drC-	**[MOTOR CONTROL]** (continued)		
SPG ★ ◌	**[Speed prop. gain]** Speed loop proportional gain. Visible if **[Motor control type]** (Ctt) is not set to **[Standard]** (Std), **[V/F 5pts]** (UF5) or **[V/F Quad.]** (UFq).	0 to 1,000%	40%
SPGU ★ ◌	**[UF inertia comp.]** Inertia factor for following motor control laws. Visible if **[Motor control type]** (Ctt) is set to **[Standard]** (Std), **[V/F 5pts]** (UF5) or **[V/F Quad.]** (UFq).	0 to 1,000%	40%
SIt ★ ◌	**[Speed time integral]** Speed loop integral time constant. Visible if **[Motor control type]** (Ctt) is not set to **[Standard]** (Std), **[V/F 5pts]** (UF5) or **[V/F Quad.]** (UFq).	1 to 65,535 ms	63 ms
SFC ★ ◌	**[K speed loop filter]** Speed filter coefficient (0(IP) to 100(PI)).	0 to 100	65
FFH ★	**[Spd est. filter time]** Accessible in Expert mode only. Frequency to filter the estimated speed.	0 to 100 ms	6.4 ms
CrtF ★	**[Cur. ref. filter time]** Accessible in Expert mode only. Filter time of the current reference filter [of control law (if **[No]** (nO): stator natural frequency)].	0 to 100 ms	3.2 ms
UFr ◌	**[IR compensation]** Used to optimize torque at very low speed, or to adapt to special cases (for example: for motors connected in parallel, decrease **[IR compensation]** (UFr)). If there is insufficient torque at low speed, increase **[IR compensation]** (UFr). A too high value can avoid the motor to start (locking) or change the current limiting mode.	0 to 200%	100%
SLP ★ ◌	**[Slip compensation]** This parameter cannot be accessed if **[Motor control type]** (Ctt) is set to **[Sync. mot.]** (SYn). This parameter is written at 0% when **[Motor control type]** (Ctt) is set to **[V/F Quad.]** (UFq). Adjusts the slip compensation around the value set by the rated motor speed. The speeds given on motor nameplates are not necessarily exact. If slip setting is lower than actual slip: The motor is not rotating at the correct speed in steady state, but at a speed lower than the reference. If slip setting is higher than actual slip: The motor is overcompensated and the speed is unstable.	0 to 300%	100%
U1 ★	**[U1]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (Ctt) is set to **[V/F 5pts]** (UF5).	0 to 800 V according to rating	0 V
F1 ★	**[F1]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (Ctt) is set to **[V/F 5pts]** (UF5).	0 to 599 Hz	0 Hz
U2 ★	**[U2]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (Ctt) is set to **[V/F 5pts]** (UF5).	0 to 800 V according to rating	0 V
F2 ★	**[F2]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (Ctt) is set to **[V/F 5pts]** (UF5).	0 to 599 Hz	0 Hz

Code	Name / Description	Adjustment range	Factory setting
U3 ★	**[U3]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 800 V according to rating	0 V
F3 ★	**[F3]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 599 Hz	0 Hz
U4 ★	**[U4]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 800 V according to rating	0 V
F4 ★	**[F4]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 599 Hz	0 Hz
U5 ★	**[U5]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 800 V according to rating	0 V
F5 ★	**[F5]** V/F profile setting. This parameter can be accessed if **[Motor control type]** (*C t t*) is set to **[V/F 5pts]** (*U F 5*).	0 to 599 Hz	0 Hz
CL1 ★ ↻	**[Current Limitation]** **CAUTION** **RISK OF DAMAGE TO THE MOTOR AND THE DRIVE** • Check that the motor will withstand this current, particularly in the case of permanent magnet synchronous motors, which are susceptible to demagnetization. • Check that the profile mission complies with the derating curve given in the installation manual. **Failure to follow these instructions can result in equipment damage.** First current limitation. **Note:** If the setting is less than 0.25 In, the drive may lock in **[Output Phase Loss]** (*O P L*) fault mode if this has been enabled (see page 253). If it is less than the no-load motor current, the motor cannot run.	0 to 1.5 In (1)	1.5 In (1)
SFt HF1 HF2	**[Switch. freq type]** The motor switching frequency will be modified (reduced) when the internal temperature of the drive will be too high. **[SFR type 1]** (*H F 1*): Heating optimization Allows the system to adapt the switching frequency according to the motor frequency. **[SFR type 2]** (*H F 2*): Motor noise optimization (for high switching frequency) Allows the system to keep a constant chosen switching frequency **[Switching freq.]** (*S F r*) whatever the motor frequency **[Output frequency]** (*r F r*). In the event of overheating, the drive automatically decreases the switching frequency. It is restored to its original value when the temperature returns to normal.		**[SFR type 1]** (*H F 1*)
SFr ↻	**[Switching freq.]** **CAUTION** **RISK OF DAMAGE TO THE DRIVE** On ATV32●●●●M2 ratings, if the RFI filters are disconnected (operation on an IT system), the drive's switching frequency must not exceed 4 kHz. **Failure to follow these instructions can result in equipment damage.** Switching frequency setting. Adjustment range: The maximum value is limited to 4 kHz if **[Motor surge limit]** (*S U L*) parameter page 117 is configured. **Note:** In the event of excessive temperature rise, the drive will automatically reduce the switching frequency and reset it once the temperature returns to normal. In case of high speed motor, it is advised to increase the Pulse Width Modulation (PWM) frequency **[Switching freq.]** (*S F r*) at 8, 12 or 16 kHz.	2 to 16 kHz	4 kHz

Parameters described in this page can be accessed by:			

| Code	Name / Description	Adjustment range	Factory setting
n r d	**[Noise reduction]**		**[No]** (n O)
	Random frequency modulation helps to prevent any resonance, which may occur at a fixed frequency.		
n O Y E S	**[No]** (n O): Fixed frequency **[Yes]** (Y E S): Frequency with random modulation		
b O A	**[Boost activation]**		**[Dynamic]** (d Y n A)
n O d Y n A S t A t	**[Inactive]** (n O): No boost **[Dynamic]** (d Y n A): Dynamic boost **[Static]** (S t A t): Static boost		
b O O ★	**[Boost]** This parameter can be accessed if **[Boost activation]** (b O A) is not set to **[No]** (n O). Adjustment of the motor magnetizing current at low speed, as a % of the rated magnetizing current. This parameter is used to increase or reduce the time taken to establish the torque. It allows gradual adjustment up to the frequency set by **[Action Boost]** (F A b). Negative values apply particularly to tapered rotor motors. Magnetizing current **Positive [Boost]** (b O O) Rated magnetizing current **Negative [Boost]** (b O O) 0 **[Action Boost]** (F A b) Frequency	-100 to 100%	0%
F A b ★	**[Action Boost]** This parameter can be accessed if **[Boost activation]** (b O A) is not set to **[No]** (n O). Frequency above which the magnetizing current is no longer affected by **[Boost]** (b O O).	0 to 599 Hz	0 Hz
S U L	**[Motor surge limit.]**		**[No]** (n O)

	This function limits motor overvoltages and is useful in the following applications:
	   - NEMA motors
	   - Japanese motors
	   - Spindle motors
	   - Rewound motors
	This parameter can remain set to **[No]** (n O) for 230/400 V motors used at 230 V, or if the length of cable between the drive and the motor does not exceed:
	   - 4 m with unshielded cables
	   - 10 m with shielded cables
	Note: When **[Motor surge limit.]** (S U L) is set to **[Yes]**(Y E S), the maximum switching frequency **[Switching freq.]** (S F r) is modified, see page 117.		

n O Y E S	**[No]** (n O): Function inactive **[Yes]** (Y E S): Function active		
S O P ★	**[Volt surge limit. opt]** Optimization parameter for transient overvoltages at the motor terminals. This parameter can be accessed if **[Motor surge limit.]** (S U L) is set to **[Yes]** (Y E S).		10 µs
6 8 10	Set to 6, 8 or 10 µs, according to the following table. **Note:** This parameter is useful for ATV32●●●N4 drives.		

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
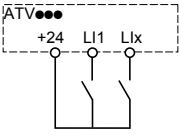

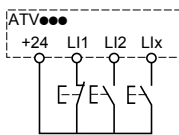

↻ Parameter that can be modified during operation or when stopped.

The value of the **[Volt surge limit. opt]** (5 0 P) parameter corresponds to the attenuation time of the cable used. It is defined to help to prevent the superimposition of voltage wave reflections resulting from long cable lengths. It limits overvoltages to twice the DC bus rated voltage.

The tables on the following page give examples of correspondence between the **[Volt surge limit. opt]** (5 0 P) parameter and the length of the cable between the drive and the motor. For longer cable lengths, an output of the filter or a dV/dt protection filter must be used.

For motors in parallel, the sum of all the cable lengths must be taken into consideration. Compare the length given in the table row corresponding to the power for one motor with that corresponding to the total power, and select the shorter length.

Example: Two 7.5 kW (10 HP) motors

Take the lengths on the 15 kW (20 HP) table row, which are shorter than those on the 7.5 kW (10 HP) row, and divide by the number of motors to obtain the length per motor (with unshielded "GORSE" cable and SOP = 6, the result is 40/2 = 20 m maximum for each 7.5 kW (10 HP) motor).
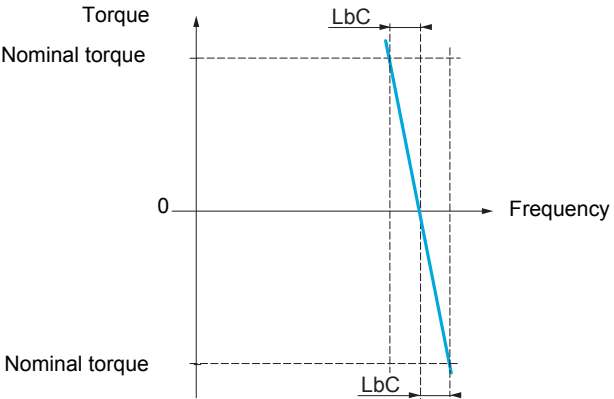

In special cases (for example, different types of cable, different motor powers in parallel, different cable lengths in parallel, etc.), we recommend using an oscilloscope to check the overvoltage values obtained at the motor terminals.

To retain the overall drive performance, do not increase the SOP value unnecessarily.

Tables giving the correspondence between the SOP parameter and the cable length, for 400 V line supply

Altivar 32	Motor		Cable cross-section (min)		Maximum cable length in meters								
Reference	Power				Unshielded "GORSE" cable Type H07 RN-F 4Gxx			Shielded "GORSE" cable Type GVCSTV-LS/LH			Shielded "BELDEN" cable Type 2950x

For 230/400 V motors used at 230 V, the **[Motor surge limit.]** (5 U L) parameter can remain set to **[No]** (n 0).

Parameters described in this page can be accessed by:			DRI- > CONF > FULL > DRC-

Code	Name / Description	Adjustment range	Factory setting
U b r ○	**[Braking level]** Braking transistor command level.	335 to 820 V	According to drive rating voltage
L b A ★ n O Y E S	**[Load sharing]** When 2 motors are connected mechanically and therefore at the same speed, and each is controlled by a drive, this function can be used to improve torque distribution between the two motors. To do this, it varies the speed based on the torque. This parameter can only be accessed if **[Motor control type]** (C t t) page 102 is set to **[SVC V]** (U U C). **[No]** (n O): Function inactive **[Yes]** (Y E S): Function active		**[No]** (n O)
L b C ★ ○	**[Load correction]** Rated correction in Hz. This parameter can be accessed if **[Load sharing]** (L b A) is set to **[Yes]** (Y E S). Torque Nominal torque ·········· 0 ──────→ Frequency Nominal torque ·········· LbC	0 to 599 Hz	0 Hz

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
○	Parameter that can be modified during operation or when stopped.

Load sharing, parameters that can be accessed at expert level

Principle:
The load sharing factor K is determined by the torque and speed, with two factors K1 and K2 (K = K1 x K2).

Parameters described in this page can be accessed by: DRI- > CONF > FULL > DRC-

Code	Name / Description	Adjustment range	Factory setting
L b C 1 ★ ()	**[Correction min spd]** This parameter can be accessed if **[Load sharing]** (L b A) is set to **[Yes]** (Y E 5). Minimum speed for load correction in Hz. Below this threshold, no corrections are made. Used to cancel correction at very low speed if this would hamper rotation of the motor.	0 to 598.9 Hz	0 Hz
L b C 2 ★ ()	**[Correction max spd]** This parameter can be accessed if **[Load sharing]** (L b A) is set to **[Yes]** (Y E 5). Speed threshold in Hz above which maximum load correction is applied.	**[Correction min spd]** (L b C 1) + 0.1 at 599 Hz	0.1 Hz
L b C 3 ★ ()	**[Torque offset]** This parameter can be accessed if **[Load sharing]** (L b A) is set to **[Yes]** (Y E 5). Minimum torque for load correction as a % of the rated torque. Below this threshold, no corrections are made. Used to avoid torque instabilities when the torque direction is not constant.	0 to 300%	0%
L b F ★ ()	**[Sharing filter]** This parameter can be accessed if **[Load sharing]** (L b A) is set to **[Yes]** (Y E 5). Time constant (filter) for correction in ms. Used in the event of flexible mechanical coupling in order to avoid instabilities.	0 to 20 s	100 ms

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

USI _dSI_ _ILOI_ _. . ._ _IL10_ _FbrN_ _SLSI_ _SLS2_ _SSII_ _SSI2_ _StOI_ _StO2_	**[+speed around ref.]** (_USI_): + Speed around ref **[-speed around ref.]** (_dSI_): - Speed around ref **[IL01]** (_ILOI_): Function blocks: Logical Input 1 **...** **[IL10]** (_IL10_): Function blocks: Logical Input 10 **[FB start]** (_FbrN_): Function blocks: Run mode **[SLS ch.1]** (_SLSI_): Safety: false consumer **[SLS ch.2]** (_SLS2_): Safety: false consumer **[SS1 ch.1]** (_SSII_): Safety: false consumer **[SS1 ch.2]** (_SSI2_): Safety: false consumer **[STO ch.1]** (_StOI_): Safety: false consumer **[STO ch.2]** (_StO2_): Safety: false consumer		
LId	**[LI1 On Delay]**	0 to 200 ms	0 ms
	This parameter is used to take account of the change of the logic input to state 1 with a delay that can be adjusted between 0 and 200 milliseconds, in order to filter out possible interference. The change to state 0 is taken into account without delay.		
_I_O-_	**[INPUTS / OUTPUTS CFG]** (continued)		
_L2-_ to _L6-_	**[LIx CONFIGURATION]** All the logic inputs available on the drive are processed as in the example for LI1 above, up to LI6.		
_L5-_	**[LI5 CONFIGURATION]** Specific parameters for LI5 used as a pulse input.		
PIA	**[RP assignment]** Read-only parameter, cannot be configured. It displays all the functions associated with the Pulse input in order to check, for example, for compatibility problems. Identical to **[AI1 assignment]** (_AIIA_) page 130.		
PIL	**[RP min value]** Pulse input scaling parameter of 0% in Hz * 10 unit.	0 to 20.00 kHz	0 kHz
PFr	**[RP max value]** Pulse input scaling parameter of 100% in Hz * 10 unit.	0 to 20.00 kHz	20.00 kHz
PFI	**[RP filter]** I/O ext Pulse input cutoff time of the low-filter.	0 to 1,000 ms	0 ms
LAI- _LA2-_	**[LAx CONFIGURATION]** The 2 analog inputs AI1 and AI2 on the drive could be used as LI inputs and are processed as in the example for LI1 above.		

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⧗ 2 s To change the assignment of this parameter, press the ENT key for 2 s.

Configuration of analog inputs and Pulse input

The minimum and maximum input values (in volts, mA, etc.) are converted to % in order to adapt the references to the application.

Minimum and maximum input values:

The minimum value corresponds to a reference of 0% and the maximum value to a reference of 100%. The minimum value may be greater than the maximum value:

Reference

100%

0%

[Min value]
(*C r L* x or
U L x or *P I L*)

[Max value]
(*C r H* x or
U H x or *P F r*)

20 mA or
10 V or
20.00 kHz

Current or voltage
or pulse input

Reference

100%

0%

[Max value]
(*C r H* x or
U H x or *P F r*)

[Min value]
(*C r L* x or
U L x or *P I L*)

20 mA or
10 V or
20.00 kHz

Current or voltage
or pulse input
For +/- bidirectional inputs, the min. and max. are relative to the absolute value, for example +/- 2 to 8 V.
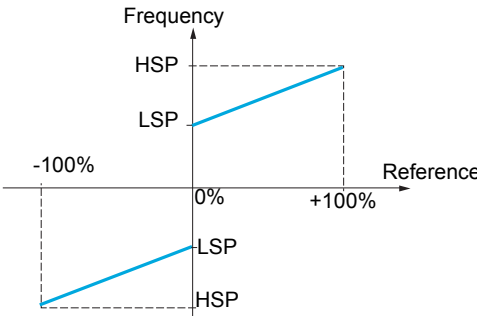

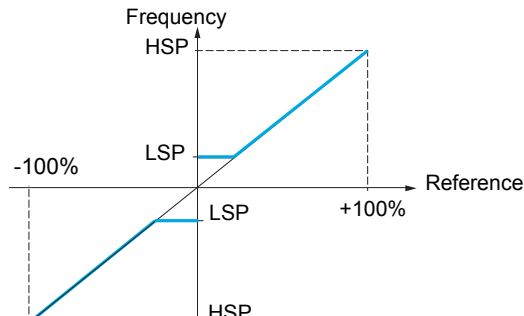

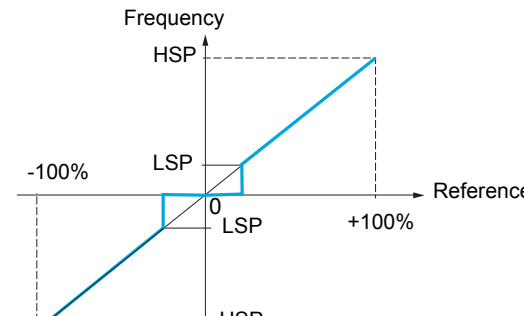

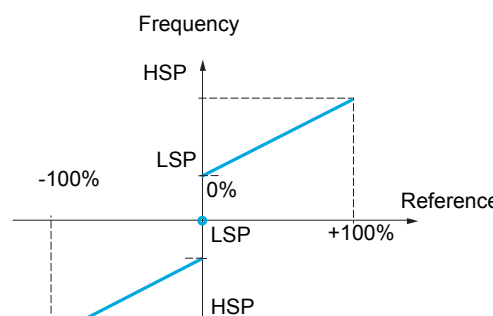

Range (output values): For analog inputs only:

This parameter is used to configure the reference range to [0% → 100%] or [-100% → +100%] in order to obtain a bidirectional output from a unidirectional input.

Reference

100%

0%

[Min value]   **[Max value]**   20 mA or 10 V

Range 0 → 100%

Current or voltage input

Reference

100%

[Min value]

0%

[Max value]   20 mA or 10 V

- 100%

Range - 100% → + 100%

Current or voltage input

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
I_O-	**[INPUTS / OUTPUTS CFG]** (continued)		
bSP	**[Reference template]**		**[Standard]** (bSd)
bSd	**[Standard]** (bSd) At zero reference the frequency = LSP		
bLS	**[Pedestal]** (bLS) At reference = 0 to LSP the frequency = LSP		
bnS	**[Deadband]** (bnS) At reference = 0 to LSP the frequency = 0		
bnS0	**[Deadband 0]** (bnS0) This operation is the same as **[Standard]** (bSd), except that in the following cases at zero reference, the frequency = 0: The signal is less than **[Min value]**, which is greater than 0 (example 1 V on a 2 - 10 V input) The signal is greater than **[Min value]**, which is greater than **[Max value]** (example: 11 V on a 10 - 0 V input). If the input range is configured as "bidirectional", operation remains identical to **[Standard]** (bSd). This parameter defines how the speed reference is taken into account, for analog inputs and Pulse input only. In the case of the PID regulator, this is the PID output reference. The limits are set by the **[Low speed]** (LSP) and **[High speed]** (HSP) parameters, page 85.		
⟲ Parameter that can be modified during operation or when stopped.

Delinearization: For analog inputs only:

The input can be delinearized by configuring an intermediate point on the input/output curve of this input:

For range 0 → 100%
Note: For [Interm. point X], 0% corresponds to [Min value] and 100% to [Max value].

For range -100% → 100%

Load slip detection :
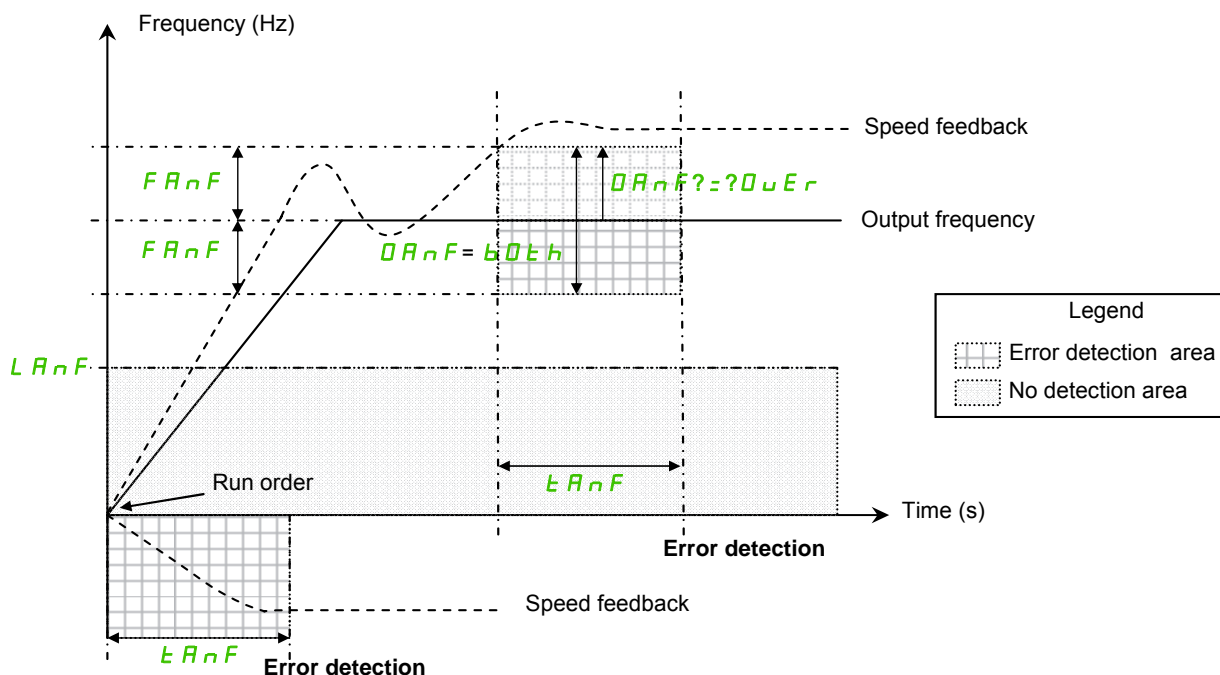

The drive will detect an error and display the error code [Load slipping] (A n F) in the following cases:

- As soon as the RUN order is received, if the sign of the output frequency and the speed feedback are in opposite way during [ANF Time Thd.] (t A n F).
- During operation:
    - if the speed feedback is in the same direction than the output frequency
    - and the speed feedback is over [ANF Detection level] (L A n F).
    - and,
        "if [ANF Direction check] (d A n F) is set to [Over] (O U E r), the difference between the output frequency and the speed feedback is over [ANF Frequency Thd.] (F A n F) during [ANF Time Thd.] (TAnF) (Overspeed detection).
        or,
        "if [ANF Direction check] (d A n F) is set to [Both] (b O t h), the difference between the output frequency and the speed feedback is over [ANF Frequency Thd.] (F A n F) or below - [ANF Frequency Thd.] (F A n F) during [ANF Time Thd.] (t A n F) (Overspeed or underspeed detection).

(1) 0 to 9,999 ms then 10.00 to 60.00 s on the integrated display terminal.

Use of analog output AO1 as a logic output

Analog output AO1 can be used as a logic output, by assigning DO1. In this case, when set to 0, this output corresponds to the AO1 min. value (0 V, or 0 mA for example), and when set to 1 to the AO1 max. value (10 V, or 20 mA for example).

The electrical characteristics of this analog output remain unchanged. As these characteristics are different from logic output characteristics, check that it is still compatible with the intended application.

(1) 0 to 9,999 ms then 10.00 to 60.00 s on the integrated display terminal.

Configuration of analog output

Minimum and maximum values (output values):

The minimum output value, in volts, corresponds to the lower limit of the assigned parameter and the maximum value corresponds to its upper limit. The minimum value may be greater than the maximum value.
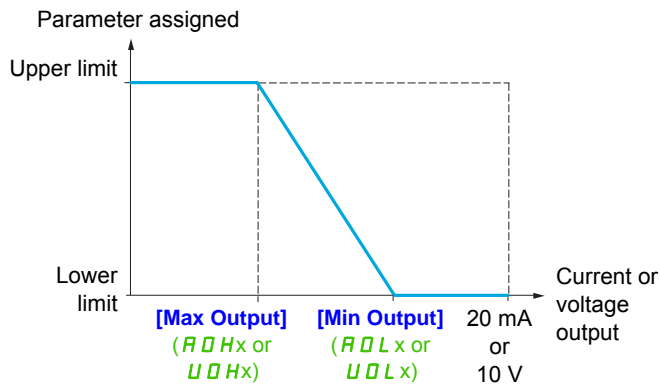

Parameters described in this page can be accessed by:

Scaling of the assigned parameter

The scale of the assigned parameter can be adapted in accordance with requirements by modifying the values of the lower and upper limits by means of two parameters for each analog output.

These parameters are given in %. 100% corresponds to the total variation range of the configured parameter, so: 100% = upper limit - lower limit For example, **[Sign. torque]** (5 Ł 9) which varies between -3 and +3 times the rated torque, 100% corresponds to 6 times the rated torque.

- The **[Scaling AOx min]** (A 5 L x) parameter modifies the lower limit: new value = lower limit + (range x ASLx). The value 0% (factory setting) does not modify the lower limit.
- The **[Scaling AOx max]** (A 5 Hx) parameter modifies the upper limit: new value = lower limit + (range x ASLx). The value 100% (factory setting) does not modify the upper limit.
- **[Scaling AOx min]** (A 5 L x) must always be lower than **[Scaling AOx max]** (A 5 Hx).

Upper limit of the assigned parameter

100 %

A 5 Hx

New scale

A 5 L x

Lower limit of the assigned parameter
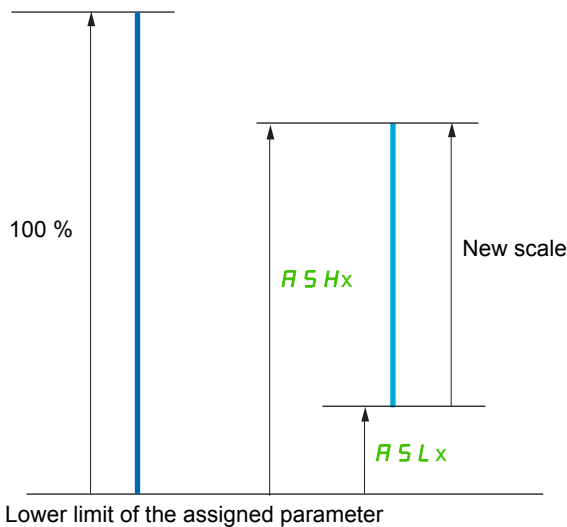

Application example 2

The value of the motor current at the AO1 output is to be transferred with 0 - 20 mA, range 2 In motor, In motor being the equivalent of a 0.8 In drive.

The **[I motor]** (O C r) parameter varies between 0 and 2 times the rated drive current, or a range of 2.5 times the rated drive current.

[Scaling AO1 min] (A 5 L 1) must not modify the lower limit, which therefore remains at its factory setting of 0%.

[Scaling AO1 max] (A 5 H 1) must modify the upper limit by 0.5x the rated motor torque, or 100 - 100/5 = 80% (new value = lower limit + (range x ASH1).

Command

The parameters in the **[COMMAND]** (*C t L -*) menu can only be modified when the drive is stopped and no run command is present.

Command and reference channels

Run commands (forward, reverse, stop, etc.) and references can be sent using the following channels:

Command	Reference
Terminals: logic inputs LI or analog inputs used as logic inputs LA Function blocks Remote display terminal Graphic display terminal Integrated Modbus Integrated CANopen® Communication card	Terminals: analog inputs AI, pulse input Function blocks Remote display terminal Graphic display terminal Integrated Modbus Integrated CANopen® Communication card +/- speed via the terminals +/- speed via the graphic display terminal

⚠ DANGER

UNINTENDED EQUIPMENT OPERATION

When analog inputs **[AI1]** (*A I 1*) or **[AI2]** (*A I 2*) are used as logic inputs (**[LAI1]** (*L A I 1*) or
[LAI2] (*L A I 2*)) in a configuration, they remain active in their behaviors in analog input mode (example :
[Ref.1 channel] (*F r 1*) is still set to **[AI1]** (*A I 1*)).
• Remove the configuration of **[AI1]** (*A I 1*) or **[AI2]** (*A I 2*) in analog input mode
or
• Check this behavior will not endanger personnel or equipment in any way
Failure to follow these instructions will result in death or serious injury.

Note: **[LA1]** (*L A 1*) and **[LA2]** (*L A 2*) can be used as 2 logic inputs in source mode only.

- + 24 V power supply (max. 30 V)
- State 0 if < 7.5 V, state 1 if > 8.5 V.

Note: The stop keys on the graphic display terminal or remote display can be programmed as non-priority keys. A stop key can only have priority if the **[Stop Key priority]** (*P S t*) parameter in the **[COMMAND]** (*C t L -*) menu, page 151 is set to **[Yes]** (*Y E S*).

The behavior of the Altivar 32 can be adapted according to requirements:
- **[Not separ.]** (*S I M*): Command and reference are sent via the same channel.
- **[Separate]** (*S E P*): Command and reference may be sent via different channels.

In these configurations, control via the communication bus is performed in accordance with the DRIVECOM standard with only 5 freely-assignable bits (see Communication Parameters Manual). The application functions cannot be accessed via the communication interface.

- **[I/O profile]** (*I O*): The command and the reference can come from different channels. This configuration both simplifies and extends use via the communication interface. Commands may be sent via the logic inputs on the terminals or via the communication bus. When commands are sent via a bus, they are available on a word, which acts as virtual terminals containing only logic inputs. Application functions can be assigned to the bits in this word. More than one function can be assigned to the same bit.

Note: Stop commands from the graphic display terminal or remote display terminal remain active even if the terminals are not the active command channel.

Command channel for [Not separ.] (5 1�П) configuration

Reference and command, not separate

The command channel is determined by the reference channel. Parameters F r 1, F r 2, r F C, F L O and F L O C are common to reference and command.

Example: If the reference is F r 1 = A I 1 (analog input at the terminals), control is via L I (logic input at the terminals).

Key:

Parameter:
The black square represents
the factory setting assignment
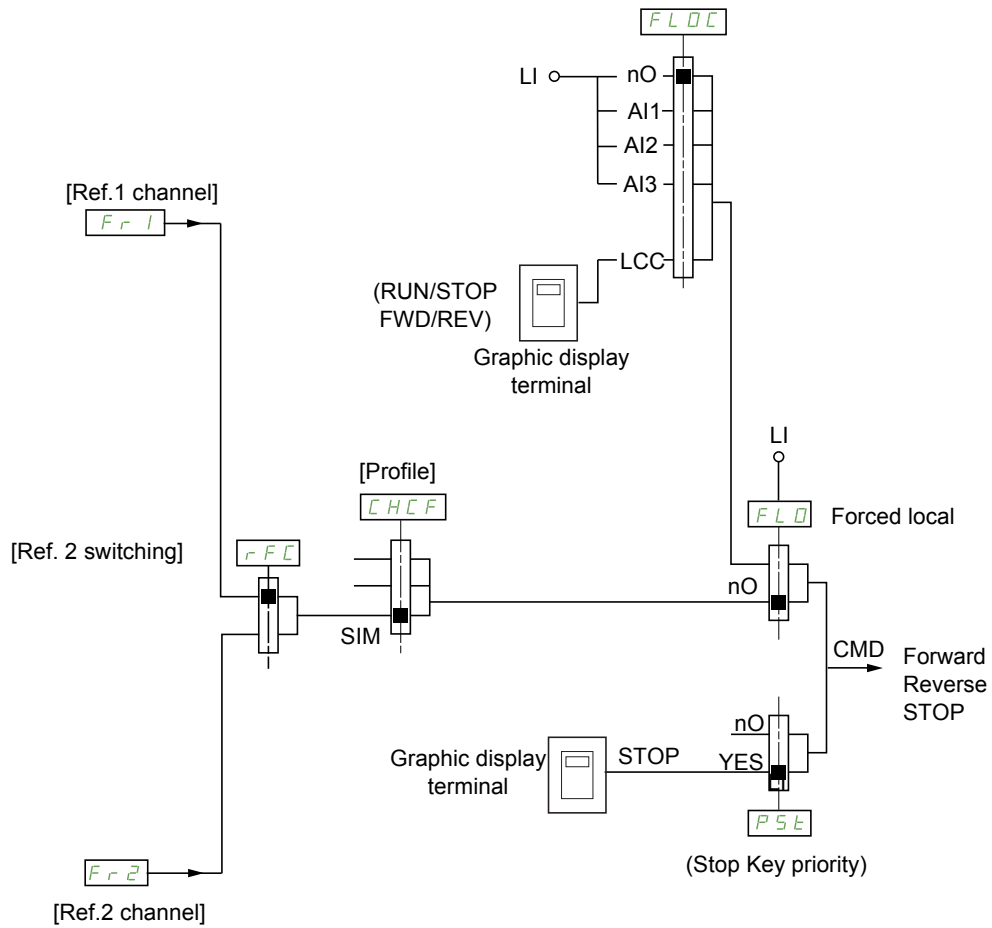

Command channel for [Separate] (5 E P) configuration

Separate reference and command

Parameters **F L D** and **F L D C** are common to reference and command.

Example: If the reference is in forced local mode via **A I I** (analog input at the terminals), command in forced local mode is via **L I** (logic input at the terminals).

The command channels **C d I** and **C d 2** are independent of the reference channels **F r I**, **F r I b** and **F r 2**.
Key:

Parameter:
The black square represents the factory setting assignment, except for [Profile].

C d I, **C d 2**:
- Terminals, graphic display terminal, integrated Modbus, integrated CANopen®, communication card

Command channel for [I/O profile] (*I O*) **configuration**

Separate reference and command, as in **[Separate]** (*S E P*) configuration

The command channels *C d 1* and *C d 2* are independent of the reference channels *F r 1*, *F r 1 b* and *F r 2*.
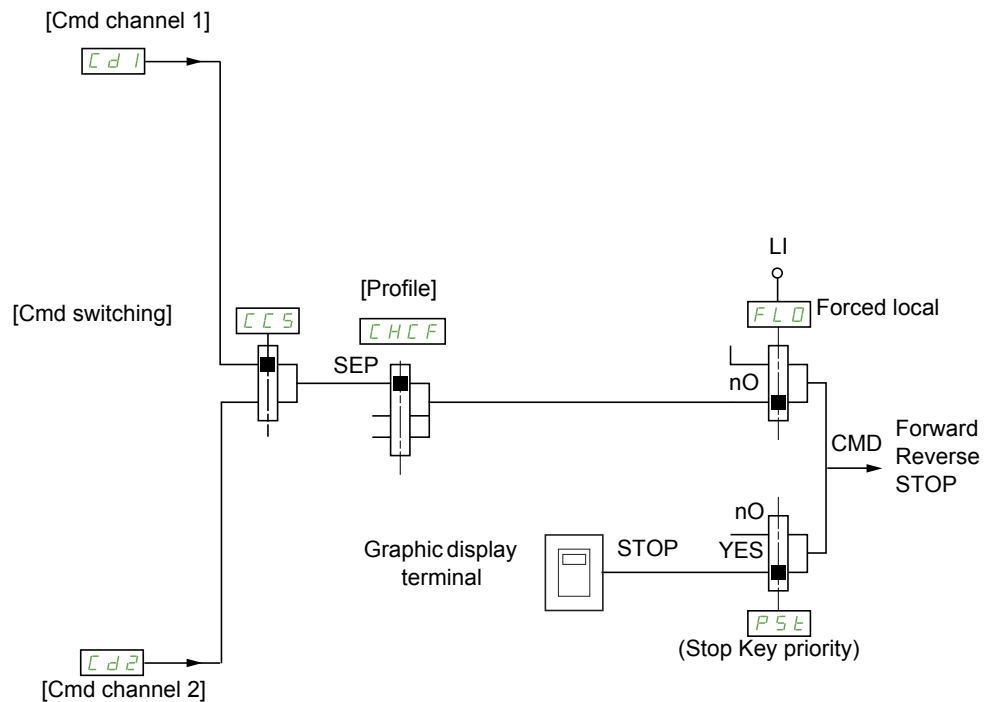

Key:

Parameter:
The black square represents the factory setting assignment, except for [Profile].

C d 1, *C d 2*:
- Terminals, graphic display terminal, integrated Modbus, integrated CANopen®, communication card

A command or an action can be assigned:
- To a fixed channel by selecting an *L I* input or a Cxxx bit:
  - By selecting, for example, *L I 3*, this action will be triggered by *L I 3* regardless of which command channel is switched.
  - By selecting, for example, *C 2 14*, this action will be triggered by integrated CANopen® with bit 14 regardless of which command channel is switched.
- To a switchable channel by selecting a CDxx bit:
  - By selecting, for example, *C d 11*, this action will be triggered by:
    L I 12 if the terminals channel is active
    C 1 11 if the integrated Modbus channel is active
    C 2 11 if the integrated CANopen® channel is active
    C 3 11 if the communication card channel is active

If the active channel is the graphic display terminal, the functions and commands assigned to CDxx switchable internal bits are inactive.

Note: *C d 0 6* to *C d 13* can only be used for switching between 2 networks. They do not have equivalent logic inputs.

Parameters described in this page can be accessed by:

Terminals	Integrated Modbus	Integrated CANopen®	Communication card	Internal bit, can be switched
				CD00
LI2 (1)	C101 (1)	C201 (1)	C301 (1)	CD01

OL01 to OL10				

(1) If **[2/3 wire control]** (*t C C*) page 83 is set to **[3 wire]** (*3 C*), *L I2*, *C I0 I*, *C 20 I* and *C 30 I* cannot be accessed.

Assignment conditions for logic inputs and control bits

The following elements are available for every command or function that can be assigned to a logic input or a control bit:

[LI1] (L I 1) to **[LI6]** (L I 6)	Drive with or without option
[LAI1] (L A I 1) to **[LAI2]** (L A I 2)	Logical inputs
[C101] (C I 0 1) to **[C110]** (C I I 0)	With integrated Modbus in **[I/O profile]** (I O) configuration
[C111] (C I I 1) to **[C115]** (C I I 5)	With integrated Modbus regardless of configuration
[C201] (C 2 0 1) to **[C210]** (C 2 I 0)	With integrated CANopen® in **[I/O profile]** (I O) configuration
[C211] (C 2 I 1) to **[C215]** (C 2 I 5)	With integrated CANopen® regardless of configuration
[C301] (C 3 0 1) to **[C310]** (C 3 I 0)	With a communication card in **[I/O profile]** (I O) configuration
[C311] (C 3 I 1) to **[C315]** (C 3 I 5)	With a communication card regardless of configuration
[CD00] (C d 0 0) to **[CD10]** (C d I 0)	In **[I/O profile]** (I O) configuration
[CD11] (C d I 1) to **[CD15]** (C d I 5)	Regardless of configuration
[OL01] (O L 0 1) to **[OL10]** (O L I 0)	Regardless of configuration

Note: In **[I/O profile]** (I O) configuration, L I 1 cannot be accessed and if **[2/3 wire control]** (t C C) page 83 is set to **[3 wire]** (3 C), L I 2, C I 0 1, C 2 0 1 and C 3 0 1 cannot be accessed either.

⚠ WARNING

LOSS OF CONTROL

Inactive communication channels are not monitored (no trip in the event of a communication bus interruption).

Check that the commands and functions assigned to bits C101 to C315 will not pose a risk in the event of the interruption of the associated communication bus.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Parameters described in this page can be accessed by: DRI- > CONF > FULL > CTL-

Code	Name / Description	Adjustment range	Factory setting
C O P ⧖ 2 s	**[Copy channel 1 <> 2]**		**[No]** (n O)

> ⚠ **DANGER**
>
> **UNINTENDED EQUIPMENT OPERATION**
>
> Copying the command and/or reference can change the direction of rotation.
>
> Check that this is safe.
>
> **Failure to follow these instructions will result in death or serious injury.**

Can be used to copy the current reference and/or the command by means of switching, in order to avoid speed surges, for example.

If **[Profile]** (C H C F) page 151 is set to **[Not separ.]** (S I M) or **[Separate]** (S E P), copying will only be possible from channel 1 to channel 2.

If **[Profile]** (C H C F) is set to **[I/O profile]** (I O), copying will be possible in both directions.

A reference or a command cannot be copied to a channel on the terminals.

The reference copied is **[Frequency ref.]** (F r H) (before ramp) unless the destination channel reference is set via +/- speed. In this case, the reference copied is **[Output frequency]** (r F r) (after ramp).

n O	**[No]** (n O): No copy
S P	**[Reference]** (S P): Copy reference
C d	**[Command]** (C d): Copy command
A L L	**[Cmd + ref.]** (A L L): Copy command and reference

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⧖ 2 s To change the assignment of this parameter, press the ENT key for 2 s.

Parameters described in this page can be accessed by:	

As the graphic display terminal may be selected as the command and/or reference channel, its action modes can be configured.

The parameters on this page can only be accessed on the graphic display terminal, and not on the integrated display terminal.

Comments:
- The display terminal command/reference is only active if the command and/or reference channels from the terminal are active with the exception of **[T/K]** (*F t*) (command via the display terminal), which takes priority over these channels. Press **[T/K]** (*F t*) (command via the display terminal) again to revert control to the selected channel.
- Command and reference via the display terminal are impossible if the latter is connected to more than one drive.
- The JOG, preset speed and +/- speed functions can only be accessed if **[Profile]** (*C H C F*) is set to **[Not separ.]** (*5 I M*).
- The preset PID reference functions can only be accessed if **[Profile]** (*C H C F*) is set to **[Not separ.]** (*5 I M*) or **[Separate]** (*5 E P*).
- The **[T/K]** (*F t*) (command via the display terminal) can be accessed regardless of the **[Profile]** (*C H C F*).

Code	Name / Description	Adjustment range	Factory setting

(1) If a graphic display terminal is not in use, values greater than 9,999 will be displayed on the 4-digit display with a period mark after the thousand digit, for example, 15.65 for 15,650.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

( ) Parameter that can be modified during operation or when stopped.

⧖ 2 s To change the assignment of this parameter, press the ENT key for 2 s.

[APPLICATION FUNCT.] (F U n -)

Summary of functions:

Code	Name	Page
(r E F -)	[REFERENCE SWITCH.]	164
(O A 1 -)	[REF. OPERATIONS]	165
(r P t -)	[RAMP]	167
(S t t -)	[STOP CONFIGURATION]	170
(A d C -)	[AUTO DC INJECTION]	173
(J O G -)	[JOG]	175
(P S S -)	[PRESET SPEEDS]	178
(U P d)	[+/- SPEED]	182
(S r E -)	[+/-SPEED AROUND REF.]	184
(S P M -)	[MEMO REFERENCE]	185
(F L 1 -)	[FLUXING BY LI]	186
(b L C -)	[BRAKE LOGIC CONTROL]	191
(E L M -)	[EXTERNAL WEIGHT MEAS.]	197
(H S H -)	[HIGH SPEED HOISTING]	202
(P I d -)	[PID REGULATOR]	207
(P r I -)	[PID PRESET REFERENCES]	211
(t O L -)	[TORQUE LIMITATION]	213
(C L 1 -)	[2nd CURRENT LIMIT.]	215
(I 2 t -)	[DYN CURRENT LIMIT]	216
(L L C -)	[LINE CONTACTOR COMMAND]	218
(O C C -)	[OUTPUT CONTACTOR CMD]	220
(L P O -)	[POSITIONING BY SENSORS]	224
(M L P -)	[PARAM. SET SWITCHING]	227
(M M C -)	[MULTIMOTORS/CONFIG.]	232
(t n L -)	[AUTO TUNING BY LI]	233
(t r O -)	[TRAVERSE CONTROL]	234
(C H S -)	[HSP SWITCHING]	241
(d C C -)	[DC BUS]	242

The parameters in the **[APPLICATION FUNCT.]** (F u n -) menu can only be modified when the drive is stopped and there is no run command, except for parameters with a ⟳ symbol in the code column, which can be modified with the drive running or stopped.

Note: Compatibility of functions

The choice of application functions may be limited by the number of I/O and by the fact that some functions are incompatible with others. Functions that are not listed in the table below are fully compatible.

If there is an incompatibility between functions, the first function configured will help to prevent the others being configured.

Each of the functions on the following pages can be assigned to one of the inputs or outputs.

⚠ **DANGER**
UNINTENDED EQUIPMENT OPERATION
A single input can activate several functions at the same time (reverse and 2nd ramp for example).
Ensure that these functions can be used at the same time.
Failure to follow these instructions will result in death or serious injury.

It is only possible to assign one input to several functions at **[Advanced]** (*A d U*) and **[Expert]** (*E P r*) levels.

Before assigning a command, reference or function to an input or output, the user must check that this input or output has not already been assigned and that another input or output has not been assigned to an incompatible function.

The drive factory setting or macro configurations automatically configure functions, **which may help to prevent other functions being assigned.**

In some case, it is necessary to unconfigure one or more functions in order to be able to enable another. Check the compatibility table below.

Stop functions have priority over run commands.

Speed references via logic command have priority over analog references.

Note: This compatibility table does not affect commands that can be assigned to the keys of the graphic display terminal (see page 24).

Parameters described in this page can be accessed by:

Compatibility table

	Reference operations (page 165)	+/- speed (3) (page 182)	Preset speeds (page 177)	PID regulator (page 207)	Traverse control (page 239)	JOG operation (page 175)	Reference switching (page 164)	Skip frequency (page 179)	Brake logic control (page 191)	Auto DC injection (page 173)	Catch on the fly (page 250)	Output contactor command (page 220)	DC injection stop (page 170)	Fast stop (page 170)	Freewheel stop (page 170)	+/- speed around a reference (page 184)	High speed hoisting (page 202)	Load sharing (page 119)	Positioning by sensors (page 224)
Reference operations (page 165)	▨	↑		● (2)		↑	↑	↑											
+/- speed (3) (page 182)		▨			●	●	↑	↑											
Preset speeds (page 177)	←		▨			↑	↑	↑											
PID regulator (page 207)	● (2)			▨	●	●	↑	↑	●							●	●	●	●
Traverse control (page 239)		●		●	▨	●	↑	↑								●	●		
JOG operation (page 175)	←	●	←	●	●	▨		↑	●	←						●	●		
Reference switching (page 164)	←	←	←	←	←		▨	↑								↑			
Skip frequency (page 179)	←	←	←	←	←	←	←	▨								←			
Brake logic control (page 191)				●		●			▨		●	●	●						
Auto DC injection (page 173)						↑				▨			↑		↑				
Catch on the fly (page 250)									●		▨

Load sharing (page 119)				●														▨	
Positioning by sensors (page 224)				●															▨

(1) Priority is given to the first of these two stop modes to be activated.
(2) Only the multiplier reference is incompatible with the PID regulator.

● Incompatible functions ☐ Compatible functions ▨ Not applicable

Priority functions (functions which cannot be active at the same time):

← ↑ The function indicated by the arrow has priority over the other.

Incompatible Functions

The following function will be inaccessible or deactivated after an Automatic restart.
This is only possible for control type if **[2/3 wire control]** (*ⵜ ⵐ ⵐ*) is set to **[2 wire]** (*ⵒ ⵐ*) and if **[2 wire type]** (*ⵜ ⵐ ⵜ*) is set to **[Level]** (*ⵐ ⴻ ⵐ*) or **[Fwd priority]** (*ⵚ ⴺ ⵜ*). See **[2/3 wire control]** (*ⵜ ⵐ ⵐ*) page 83.

The **[1.2 MONITORING]** (*ⵐ ⵜ ⵒ -*) menu page 45 can be used to display the functions assigned to each input in order to check their compatibility.

When a function is assigned, a ✓ appears on the graphic display terminal, as illustrated in the example below:

```
RDY       Term    0.0Hz      0A
         APPLICATION FUNCT.
REFERENCE SWITCH.
REF. OPERATIONS
RAMP
STOP CONFIGURATION
AUTO DC INJECTION
   Code      <<      >>     Quick
```

If you attempt to assign a function that is incompatible with another function that has already been assigned, an alarm message will appear:

- With the graphic display terminal:

```
RDY       Term    +0.0 Hz    0.0 A
         INCOMPATIBILITY
The function can't be assigned
because an incompatible
function is already selected. See
programming book.
ENT or ESC to continue
```

- With the integrated display terminal and the remote display terminal:
COMP flashes until ENT or ESC is pressed.

When you assign a logic input, an analog input, a reference channel or a bit to a function, pressing the HELP key will display the functions that may already have been activated by this input, bit or channel.

When a logic input, an analog input, a reference channel or a bit that has already been assigned is assigned to another function, the following screens appear:

- With the graphic display terminal:

```
RUN      Term     0.0 Hz     0.0 A
      WARNING - ASSIGNED TO
Forward

   ENT-Valid.           ESC-Abort
```

If the access level permits this new assignment, pressing ENT confirms the assignment.

If the access level does not permit this new assignment, pressing ENT results in the following display:

```
RUN      Term     0.0 Hz     0.0 A
       ASSIGNMENT FORBIDDEN
Un-assign the present
functions, or select
"Advanced" access level

```

- With the integrated display terminal:
The code for the first function, which is already assigned, is displayed flashing.

If the access level permits this new assignment, pressing ENT confirms the assignment.

If the access level does not permit this new assignment, pressing ENT has no effect, and the message continues to flash. It is only possible to exit by pressing ESC.

Parameters described in this page can be accessed by:	

REFERENCE SWITCHING

Code	Name / Description	Adjustment range	Factory setting

REFERENCE OPERATIONS

Summing input / Subtracting input / Multiplier
$$A = (Fr1 \text{ or } Fr1b + SA2 + SA3 - dA2 - dA3) \times MA2 \times MA3$$

- If $5R2$, $5R3$, $dR2$, $dR3$ are not assigned, they are set to 0.
- If $\Pi R2$, $\Pi R3$ are not assigned, they are set to 1.
- A is limited by the minimum $L5P$ and maximum $H5P$ parameters.
- For multiplication, the signal on $\Pi R2$ or $\Pi R3$ is interpreted as a %. 100% corresponds to the maximum value of the corresponding input. If $\Pi R2$ or $\Pi R3$ is sent via the communication bus or graphic display terminal, an ΠFr multiplication variable, page 282 must be sent via the bus or graphic display terminal.
- Reversal of the direction of operation in the event of a negative result can be inhibited (see **[RV Inhibition]** ($5 \, l \, n$) page 151).

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
OR I-	**[REF. OPERATIONS]**		
	Reference = (Fr1 or Fr1b + SA2 + SA3 - dA2 - dA3) x MA2 x MA3. See the diagrams on pages 144 and 145. **Note:** This function cannot be used with certain other functions. Follow the instructions on page 160.		
5R2	**[Summing ref. 2]**		**[No]** ($n0$)
	Selection of a reference to be added to **[Ref.1 channel]** ($Fr \, l$) or **[Ref.1B channel]** ($Fr \, lb$).		
n0	**[No]** ($n0$): Not assigned		
R I I	**[AI1]** ($R \, l \, l$): Analog input A1		
R I2	**[AI2]** ($R \, l2$): Analog input A2		
R I3	**[AI3]** ($R \, l3$): Analog input A3

L In	**[Linear]** (L In)		
5	**[S ramp]** (5)		
U	**[U ramp]** (U)		
CUS	**[Customized]** (CUS)		
	S ramps		
	The rounding coefficient is fixed, t1 = 0.6 set ramp time (linear) t2 = 0.4 set ramp time (round) t3 = 1.4 set ramp time		
	U ramps		
	The rounding coefficient is fixed, t1 = 0.5 set ramp time (linear) t2 = 1.0 set ramp time (round) t3 = 1.5 set ramp time		
	Customized ramps		
	tA1: adjustable from 0 to 100% tA2: adjustable from 0 to (100% - tA1) tA3: adjustable from 0 to 100% tA4: adjustable from 0 to (100% - tA3)		
	t12 = ACC * (tA1(%) / 100 + tA2(%) / 100 + 1) t34 = DEC * (tA3(%) / 100 + tA4(%) / 100 + 1)		
Inr (1)	**[Ramp increment]** This parameter is valid for **[Acceleration]** (ACC), **[Deceleration]** (dEC), **[Acceleration 2]** (AC2) and **[Deceleration 2]** (dE2).		**[0,1]** (0. 1)
0. 01 0. 1 1	**[0,01]**: Ramp up to 99.99 seconds **[0,1]**: Ramp up to 999.9 seconds **[1]**: Ramp up to 6,000 seconds		
ACC (1)	**[Acceleration]** Time to accelerate from 0 to the **[Rated motor freq.]** (FrS) (page 84). To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application.	0.00 to 6,000 s (2)	3.0 s
dEC (1)	**[Deceleration]** Time to decelerate from the **[Rated motor freq.]** (FrS) (page 84) to 0. To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application.	0.00 to 6,000 s (2)	3.0 s
tA1 ⭐ (1)	**[Begin Acc round]** Rounding of start of acceleration ramp as a % of the **[Acceleration]** (ACC) or **[Acceleration 2]** (AC2) ramp time. Can be set between 0 and 100%. This parameter can be accessed if the **[Ramp type]** (rPt) is **[Customized]** (CUS).	0 to 100%	10%

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > FUN- > STT-

Code	Name / Description	Adjustment range	Factory setting
tA2 ★ () (1)	**[End Acc round]** Rounding of end of acceleration ramp as a % of the **[Acceleration]** (ACC) or **[Acceleration 2]** (AC2) ramp time. Can be set between 0 and (100% - **[Begin Acc round]** (tA1)). This parameter can be accessed if the **[Ramp type]** (rPt) is **[Customized]** (CUS).	0 to 100%	10%
tA3 ★ () (1)	**[Begin Dec round]** Rounding of start of deceleration ramp as a % of the **[Deceleration]** (dEC) or **[Deceleration 2]** (dE2) ramp time. Can be set between 0 and 100%. This parameter can be accessed if the **[Ramp type]** (rPt) is **[Customized]** (CUS).	0 to 100%	10%
tA4 ★ () (1)	**[End Dec round]** Rounding of end of deceleration ramp as a % of the **[Deceleration]** (dEC) or **[Deceleration 2]** (dE2) ramp time. Can be set between 0 and (100% - **[Begin Dec round]** (tA3)). This parameter can be accessed if the **[Ramp type]** (rPt) is **[Customized]** (CUS).	0 to 100%	10%
Frt	**[Ramp 2 threshold]** Ramp switching threshold The 2nd ramp is switched if the value of **[Ramp 2 threshold]** (Frt) is not 0 (0 deactivates the function) and the output frequency is greater than **[Ramp 2 threshold]** (Frt). Threshold ramp switching can be combined with **[Ramp switch ass.]** (rPS) switching as follows:	0 to 599 Hz according to rating	0 Hz

LI or bit	Frequency	Ramp
0	< Frt	ACC, dEC
0	> Frt	AC2, dE2
1	< Frt	AC2, dE2
1	> Frt	AC2, dE2

Code	Name / Description	Adjustment range	Factory setting
rPS	**[Ramp switch ass.]** Identical to **[Ref.1B channel]** (Fr1b) page 164.		**[No]** (nO)
AC2 ★ () (1)	**[Acceleration 2]** Time to accelerate from 0 to the **[Rated motor freq.]** (FrS). To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. This parameter can be accessed if **[Ramp 2 threshold]** (Frt) is greater than 0 or if **[Ramp switch ass.]** (rPS) is assigned.	0.00 to 6,000 s (2)	5.0 s
dE2 ★ () (1)	**[Deceleration 2]** Time to decelerate from **[Rated motor freq.]** (FrS) to 0. To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. This parameter can be accessed if **[Ramp 2 threshold]** (Frt) is greater than 0 or if **[Ramp switch ass.]** (rPS) is assigned.	0.00 to 6,000 s (2)	5.0 s

Parameters described in this page can be accessed by:			DRI- > CONF > FULL > FUN- > STT-

Code	Name / Description	Adjustment range	Factory setting
b r A	**[Dec ramp adapt.]**		**[Yes]** (Y E S)

<div style="border:1px solid black; padding:10px;">

CAUTION

RISK OF DAMAGE TO THE MOTOR
Choose only **[Dec ramp adapt.]** (b r A) = **[Yes]** (Y E S) or **[No]** (n O) if the motor is a permanent magnet synchronous motor, otherwise it will be demagnetized.
Failure to follow these instructions can result in equipment damage.

</div>

Activating this function automatically adapts the deceleration ramp, if this has been set at a too low value according to the inertia of the load, which can cause an overvoltage detected fault.
[Dec ramp adapt.] (b r A) is forced to **[No]** (n O) if the brake logic control **[Brake assignment]** (b L C) is assigned (page 191). The function is incompatible with applications requiring:
- Positioning on a ramp.
- The use of a braking resistor (the resistor would not operate correctly).

n O — **[No]** (n O): Function inactive
Y E S — **[Yes]** (Y E S): Function active, for applications that do not require strong deceleration
The following selections appear depending on the rating of the drive and **[Motor control type]** (C t t) page 102. They enable stronger deceleration to be obtained than with **[Yes]** (Y E S). Use comparative testing to determine your selection.
d Y n A — **[High torq. A]** (d Y n A): Addition of a constant current flow component.
When **[Dec ramp adapt.]** (b r A) is configured on **[High torq. x]** (d Y n x), the dynamic performances for braking are improved by the addition of a current flow component. The aim is to increase the iron loss and magnetic energy stored in the motor.

(1) The parameter can also be accessed in the **[SETTINGS]** (S E t -) menu.
(2) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6,000 s according to **[Ramp increment]** (I n r) page 167.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

↻ Parameter that can be modified during operation or when stopped.

Parameters described in this page can be accessed by:	

STOP CONFIGURATION

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
STT-	**[STOP CONFIGURATION]**		
	Note: Some types of stops cannot be used with all other functions. Follow the instructions on page 160.		
Stt	**[Type of stop]**		**[Ramp stop]** (rMP)
	Stop mode on disappearance of the run command or appearance of a stop command. **Note:** If the "brake logic" function on page 191 has been enabled, or if **[Low speed time out]** (tLS) page 93 or 210 is not 0, only ramp type stops may be configured.		
rMP FSt nSt dCI	**[Ramp stop]** (rMP): Stop on ramp **[Fast stop]** (FSt): Fast stop **[Freewheel]** (nSt): Freewheel stop **[DC injection]** (dCI): DC injection stop. Available only if **[Motor control type]** (Ctt) page 102 is not set to **[Sync. mot.]** (SYn).		
FFt ★ ⟳ (1)	**[Freewheel stop Thd.]**	0.2 to 599 Hz	0.2 Hz
	Speed threshold below which the motor will switch to freewheel stop. This parameter supports switching from a ramp stop or a fast stop to a freewheel stop below a low speed threshold. This parameter can be accessed if **[Type of stop]** (Stt) is set to **[Fast stop]** (FSt) or **[Ramp stop]** (rMP) and if **[Brake assignment]** (bLC) or **[Auto DC injection]** (AdC) are configured.		
nSt	**[Freewheel stop ass.]**		**[No]** (nO)
	The stop is activated when the input or the bit changes to 0. If the input returns to state 1 and the run command is still active, the motor will only restart if **[2/3 wire control]** (tCC) page 83 is set to **[2 wire]** (2C) and if **[2 wire type]** (tCt) is set to **[Level]** (LEL) or **[Fwd priority]** (PFO). If not, a new run command must be sent.		
nO LI1 . . .	**[No]** (nO): Not assigned **[LI1]** (LI1): Logical input LI1 **[...]** (. . .): See the assignment conditions on page 150		
FSt	**[Fast stop assign.]**		**[No]** (nO)
	The stop is activated when the input changes to 0 or the bit changes to 1 (bit in **[I/O profile]** (IO) at 0). If the input returns to state 1 and the run command is still active, the motor will only restart if **[2/3 wire control]** (tCC) page 83 is set to **[2 wire]** (2C) and if **[2 wire type]** (tCt) is set to **[Level]** (LEL) or **[Fwd priority]** (PFO). If not, a new run command must be sent. **Note:** This function cannot be used with certain other functions. Follow the instructions on page 160.		
nO LI1 . . .	**[No]** (nO): Not assigned **[LI1]** (LI1): Logical input LI1 **[...]** (. . .): See the assignment conditions on page 150		
dCF ★ ⟳ (1)	**[Ramp divider]**	0 to 10	4
	This parameter can be accessed if **[Type of stop]** (Stt) is set to **[Fast stop]** (FSt) and if **[Fast stop assign.]** (FSt) is not **[No]** (nO) and if **[Stop type]** (PAS) is set to **[Fast stop]** (FSt). The ramp that is enabled (**[Deceleration]** (dEC) or **[Deceleration 2]** (dE2)) is then divided by this coefficient when stop requests are sent. Value 0 corresponds to a minimum ramp time.		

Parameters described in this page can be accessed by:			DRI- > CONF > FULL > FUN- > ADC-

Code	Name / Description	Adjustment range	Factory setting
dC1	**[DC injection assign.]**		**[No]** (nO)

⚠ WARNING

NO HOLDING TORQUE
• DC injection braking does not provide any holding torque at zero speed.
• DC injection braking does not work when there is a loss of power or when the drive detects a fault.
• Where necessary, use a separate brake to maintain torque levels.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

DC injection braking is initiated when the assigned input or bit changes to state 1.
If the input returns to state 0 and the run command is still active, the motor will only restart if **[2/3 wire control]** (tCC) page 83 is set to **[2 wire]** (2C) and if **[2 wire type]** (tCt) is set to **[Level]** (LEL) or **[Fwd priority]** (PFO). If not, a new run command must be sent.
Note: This function cannot be used with certain other functions. Follow the instructions on page 160.

nO	**[No]** (nO): Not assigned

JPF ⟳	**[Skip Frequency]** Skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a critical speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive.	0 to 599 Hz	0 Hz

Parameters described in this page can be accessed by:　　　　　　　　DRI- > CONF > FULL > FUN- > UPD-

Code	Name / Description	Adjustment range	Factory setting
JF2	**[Skip Frequency 2]**	0 to 599 Hz	0 Hz
⟳	2nd skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a critical speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive.		
JF3	**[3rd Skip Frequency]**	0 to 599 Hz	0 Hz
⟳	3rd skip frequency. This parameter helps to prevent prolonged operation within an adjustable range around the regulated frequency. This function can be used to help to prevent a critical speed, which would cause resonance, being reached. Setting the function to 0 renders it inactive.		
JFH	**[Skip.Freq.Hysteresis]**	0.1 to 10 Hz	1 Hz
★ ⟳	This parameter is visible if at least one skip frequency **[Skip Frequency]** (JPF), **[Skip Frequency 2]** (JF2) or **[3rd Skip Frequency]** (JF3) is different from 0. Skip frequency range: between (JPF − JFH) and (JPF + JFH), for example. This adjustment is common to the 3 frequencies (JPF, JF2, JF3).		

(1) The parameter can also be accessed in the **[SETTINGS]** (SEt-) menu.

★　These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⟳　Parameter that can be modified during operation or when stopped.

+/- SPEED

Two types of operations are available:

- **Use of single action keys:** Two logic inputs are required in addition to the operating direction(s). The input assigned to the "+ speed" command increases the speed, the input assigned to the "- speed" command decreases the speed.
- **Use of double action keys:** Only one logic input assigned to "+ speed" is required.

+/- speed with double-press buttons:

Description: 1 button pressed twice (2 steps) for each direction of rotation. A contact closes each time the button is pressed.

	Released (- speed)	1st press (speed maintained)	2nd press (faster)
Forward button	–	a	a and b
Reverse button	–	c	c and d

Example of wiring:

ATV●●● control terminals

LI1 LIx LIy +24

b d

a c

LI1: Forward

LIx: Reverse

LIy: + speed

Motor frequency
Do not use this +/-speed type with 3-wire control.

Whichever type of operation is selected, the max. speed is set by **[High speed]** (HSP) (see page 85).

Note:

If the reference is switched via **[Ref. 2 switching]** (rFC) (see page 152) from any one reference channel to another reference channel with "+/- speed", the value of reference **[Output frequency]** (rFr) (after ramp) may be copied at the same time in accordance with the **[Copy channel 1 --> 2]** (COP) parameter (see page 153).

If the reference is switched via **[Ref. 2 switching]** (rFC) (see page 152) from one reference channel to any other reference channel with "+/- speed", the value of reference **[Output frequency]** (rFr) (after ramp) is copied at the same time.

This helps to prevent the speed being incorrectly reset to zero when switching takes place.
Parameters described in this page can be accessed by:			DRI- > CONF > FULL > FUN- > SRE-

Code	Name / Description	Adjustment range	Factory setting
F U n -	**[APPLICATION FUNCT.]** (continued)		
U P d -	**[+/- SPEED]** This function can be accessed if reference channel **[Ref.2 channel]** (F r 2) is set to **[+/-Speed]** (U P d t), see page 152. **Note:** This function cannot be used with certain other functions. Follow the instructions on page 160 .		
U S P n O L I 1 . . .	**[+ speed assignment]** Function active if the assigned input or bit is at 1. **[No]** (n O): Not assigned **[LI1]** (L I 1): Logical input LI1 **[...]** (. . .): See the assignment conditions on page 150		**[No]** (n O)

S t r
 	
 ★
 	
 n O
 r A M
 E E P
	[Reference saved]
	
	 Associated with the "+/- speed" function, this parameter can be used to save the reference:
	     - When the run commands disappear (saved to RAM).
	     - When the line supply or the run commands disappear (saved to EEPROM).
	 Therefore, the next time the drive starts up, the speed reference is the last reference saved.
	
	 [No] (n O): No save (the next time the drive starts up, the speed reference is **[Low speed]** (L S P), see page 85)
	 [RAM] (r A M): Saved in RAM
	 [EEprom] (E E P): Saved in EEPROM
			[No] (n O)

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

+/- SPEED AROUND A REFERENCE

The reference is given by **[Ref.1 channel]** ($F r 1$) or **[Ref.1B channel]** ($F r 1b$) with summing/subtraction/multiplication functions and preset speeds if relevant (see the diagram on page 144). For improved clarity, we will call this reference A. The action of the +speed and -speed keys can be set as a % of this reference A. On stopping, the reference (A +/- speed) is not saved, so the drive restarts with reference A+ only.

The maximum total reference is limited by **[High speed]** ($H S P$) and the minimum reference by **[Low speed]** ($L S P$), see page 85.

Example of 2-wire control:
Parameters described in this page can be accessed by: DRI- > CONF > FULL > FUN- > FLI-

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)

SrP ★ ◯	**[+/-Speed limitation]** This parameter limits the variation range with +/- speed as a % of the reference. The ramps used in this function are **[Acceleration 2]** (AC2) and **[Deceleration 2]** (dE2). This parameter can be accessed if +/- speed is assigned.	0 to 50%	10%
AC2 ★ ◯ (1)	**[Acceleration 2]** Time to accelerate from 0 to the **[Rated motor freq.]** (FrS). To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. This parameter can be accessed if **[+/- speed]** (tUd) is assigned.	0.00 to 6,000 s (2)	5.00 s
dE2 ★ ◯ (1)	**[Deceleration 2]** Time to decelerate from the **[Rated motor freq.]** (FrS) to 0. To have repeatability in ramps, the value of this parameter must be set according to the possibility of the application. This parameter can be accessed if **[+/- speed]** (tUd) is assigned.	0.00 to 6,000 s (2)	5.00 s

(1) The parameter can also be accessed in the **[SETTINGS]** (SEt-) menu.
(2) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6,000 s according to **[Ramp increment]** (Inr) page 167.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
◯ Parameter that can be modified during operation or when stopped.

REFERENCE MEMORIZING

Saving a speed reference value using a logic input command lasting longer than 0.1 s.

- This function is used to control the speed of several drives alternately via a single analog reference and one logic input for each drive.
- It is also used to confirm a line reference (communication bus or network) on several drives via a logic input. This allows movements to be synchronized by getting rid of variations when the reference is set.
- The reference is acquired 100 ms after the rising edge of the request. A new reference is not then acquired until a new request is made.

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
SPM-	**[MEMO REFERENCE]**		
SPM	**[Ref. memo ass.]** Assignment to a logic input. Function active if the assigned input is at active state.		**[No]** (nO)
nO LI1 ...	**[No]** (nO): Not assigned **[LI1]** (LI1): Logical input LI1 **[...]** (. . .): See the assignment conditions on page 150		

FLUXING BY LOGIC INPUT

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
FLI-	**[FLUXING BY LI]**		
FLU ★ () (1) ⧖ 2 s	**[Motor fluxing]**		**[No]** (FnO)

⚠ ⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

When **[Motor fluxing]** (FLU) is set to **[Continuous]** (FCt), the drive automatically builds up flux.

Check this action will not endanger personnel or equipment in any way.

Failure to follow these instructions will result in death or serious injury.

CAUTION

RISK OF DAMAGE TO THE MOTOR

Check that the motor will withstand this current without overheating.

Failure to follow these instructions can result in equipment damage.

FnC   **[Not cont.]** (FnC): Non-continuous mode
FCt   **[Continuous]** (FCt): Continuous mode.
This option is not possible if **[Auto DC injection]** (AdC) page 173 is **[Yes]** (YES) or if **[Type of stop]** (Stt) page 170 is **[Freewheel]** (nSt).
FnO   **[No]** (FnO): Function inactive

In order to obtain rapid high torque on startup, magnetic flux needs to already have been established in the motor.
In **[Continuous]** (FCt) mode, the drive automatically builds up flux when it is powered up.
In **[Not cont.]** (FnC) mode, fluxing occurs when the motor starts up.
The flux current is greater than **[Rated mot. current]** (nCr) (configured rated motor current) when the flux is established and is then adjusted to the motor magnetizing current.

If **[Motor control type]** (Ctt) page 102 is set to **[Sync. mot.]** (SYn), the **[Motor fluxing]** (FLU) parameter causes the alignment of the rotor and not the fluxing.
If **[Brake assignment]** (bLC) page 191 is not **[No]** (nO), the **[Motor fluxing]** (FLU) parameter has no effect.

Code	Name / Description	Adjustment range	Factory setting
FLI ★	**[Fluxing assignment]**		**[No]** (nO)

CAUTION

RISK OF DAMAGE TO THE MOTOR

Check that the motor will withstand this current without overheating.

Failure to follow these instructions can result in equipment damage.

Assignment is only possible if **[Motor fluxing]** (FLU) is set to **[Not cont.]** (FnC).
If an LI or a bit is assigned to the motor fluxing command, flux is built up when the assigned input or bit is at 1.
If an LI or a bit has not been assigned, or if the assigned LI or bit is at 0 when a run command is sent, fluxing occurs when the motor starts.

nO   **[No]** (nO): Not assigned
LI1   **[LI1]** (LI1): Logical input LI1
...   **[...]** (. . .): See the assignment conditions on page 150

Code	Name / Description	Adjustment range	Factory setting
A S t	**[Angle setting type]**		**[PSIO align.]** (P 5 I0)
⭐	Mode for measuring the phase-shift angle. Visible only if **[Motor control type]** (C t t) is set to **[Sync. mot.]** (5 Y n). **[PSI align]** (P 5 I) and **[PSIO align]** (P 5 I0) are working for all type of synchronous motors. **[SPM align]** (5 P N A) and **[IPM align]** (I P N A) increase performances depending on the type of synchronous motor.		
I P N A S P N A	**[IPM align]** (I P N A): Alignment for IPM motor. Alignment mode for Interior-buried Permanent Magnet motor (usually, this kind of motor has a high saliency level). It uses high frequency injection, which is less noisy than standard alignment mode. **[SPM align]** (5 P N A): Alignment for SPM motor. Mode for Surface-mounted Permanent Magnet motor (usually, this kind of motor has a medium or low saliency level). It uses high frequency injection, which is less noisy than standard alignment mode.		
P 5 I P 5 I0	**[PSI align]** (P 5 I): Pulse signal injection. Standard alignment mode by pulse signal injection. **[PSIO align]** (P 5 I0): Pulse signal injection - Optimized. Standard optimized alignment mode by pulse signal injection. The phase-shift angle measurement time is reduced after the first run order or tune operation, even if the drive has been turned off.		
n 0	**[No align]** (n 0): No alignment		

(1) The parameter can also be accessed in the **[SETTINGS]** (5 E t -) menu.

⭐ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

◯ Parameter that can be modified during operation or when stopped.

⧖ 2 s To change the assignment of this parameter, press the ENT key for 2 s.

BRAKE LOGIC CONTROL

Used to control an electromagnetic brake by the drive, for horizontal and vertical hoisting applications, and for unbalanced machines.

Principle:

- Vertical hoisting movement:

Maintain motor torque in the driving load holding direction during brake opening and closing, in order to hold the load, start smoothly when the brake is released and stop smoothly when the brake is engaged.

- Horizontal movement:

Synchronize brake release with the build-up of torque during startup and brake engage at zero speed on stopping, to help to prevent jolting.

Recommended settings for brake logic control for a vertical hoisting application:

⚠ WARNING
LOSS OF CONTROL   • Check that the selected settings and configurations will not result in the dropping or loss of control of the load being lifted.   • Follow the recommandations below.   **Failure to follow these instructions can result in death, serious injury, or equipment damage.**

- **[Brake impulse]** (*b IP*): **[Yes]** (*YE S*). Ensure that the direction of rotation FW corresponds to lifting the load.
  For applications in which the load being lowered is very different from the load being lifted, set *b IP* = 2 *Ibr* (for example, ascent always with a load and descent always without a load).
- Brake release current (**[Brake release I FW]** (*Ibr*) and **[Brake release I Rev]** (*Ird*) if **[Brake impulse]** (*b IP*) = 2 *Ibr*): Adjust the brake release current to the rated current indicated on the motor.
  During testing, adjust the brake release current in order to hold the load smoothly.
- Acceleration time: For hoisting applications, it is advisable to set the acceleration ramps to more than 0.5 seconds. Ensure that the drive does not exceed the current limit.
  The same recommendation applies for deceleration.
  Reminder: For a hoisting movement, a braking resistor should be used.
- **[Brake Release time]** (*brt*): Set according to the type of brake. It is the time required for the mechanical brake to release.
- **[Brake release frequency]** (*b Ir*), in open-loop mode only: Leave in **[Auto]** (*AUTO*), adjust if necessary.
- **[Brake engage frequency]** (*bEn*): Leave in **[Auto]** (*AUTO*), adjust if necessary.
- **[Brake engage time]** (*bEt*): Set according to the type of brake. It is the time required for the mechanical brake to engage.

Recommended settings for brake logic control for a horizontal hoisting application:

- **[Brake impulse]** (*b IP*): No
- **[Brake release I FW]** (*Ibr*): Set to 0.
- **[Brake Release time]** (*brt*): Set according to the type of brake. It is the time required for the mechanical brake to release.
- **[Brake engage frequency]** (*bEn*), in open-loop mode only: Leave in **[Auto]** (*AUTO*), adjust if necessary.
- **[Brake engage time]** (*bEt*): Set according to the type of brake. It is the time required for the mechanical brake to engage.

b1r ★ () (1)	**[Brake release freq]** Brake release frequency threshold (initialization of acceleration ramp). This parameter can be accessed if **[Movement type]** (bSt) page 191 is set to **[Hoisting]** (UEr).	**[Auto]** (AUtO) to 10 Hz	**[Auto]** (AUtO)
AUtO	**[Auto]** (AUtO): The drive takes a value equal to the rated slip of the motor, calculated using the drive parameters **0 to 10 Hz**: Manual control.		
bEn ★ () (1)	**[Brake engage freq]** Brake engage frequency threshold. **Note: [Brake engage freq]** (bEn) cannot be higher than **[Low speed]** (LSP).	**[Auto]** (AUtO) 0 to 10 Hz	**[Auto]** (AUtO)
AUtO	**[Auto]** (AUtO): The drive takes a value equal to the rated slip of the motor, calculated using the drive parameters **0 to 10 Hz**: Manual control.		
tbE ★ () (1)	**[Brake engage delay]**	0 to 5.00 s	0 s

⚠ **WARNING**

LOSS OF CONTROL
Modify the Brake engage delay for horizontal movement only otherwise the control of the load can be lost.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Time delay before request to engage brake.

Code	Name / Description	Adjustment range	Factory setting
bEt ★ () (1)	**[Brake engage time]** Brake engage time (brake response time).	0 to 5.00 s	0 s
SdC1 ★ () (1)	**[Auto DC inj. level 1]**	0 to 1.2 In (2)	0.7 In (2)

CAUTION

RISK OF DAMAGE TO THE MOTOR
Check that the motor will withstand this current without overheating.
Failure to follow these instructions can result in equipment damage.

Level of standstill DC injection current.
Note: This parameter can be accessed if **[Movement type]** (bSt) page 191 is set to **[Traveling]** (HOr).

Code	Name / Description	Adjustment range	Factory setting
bEd ★ ()	**[Engage at reversal]** Can be used to select whether or not the brake engages on transition to zero speed when the operating direction is reversed.		**[No]** (nO)
nO YES	**[No]** (nO): The brake does not engage **[Yes]** (YES): The brake engages		

	Parameters described in this page can be accessed by:		DRI- > CONF > FULL > FUN- > BLC-

Code	Name / Description	Adjustment range	Factory setting
JdC ★ ◯ (1)	**[Jump at reversal]** This parameter can be accessed if **[Movement type]** (b 5 t) page 191 is set to **[Hoisting]** (U E r).	**[Auto]** (A U t O) to 10 Hz	**[Auto]** (A U t O)
AUtO -	**[Auto]** (A U t O): The drive takes a value equal to the rated slip of the motor, calculated using the drive parameters **0 to 10 Hz**: Manual control When the reference direction is reversed, this parameter can be used to avoid loss of torque (and consequential release of load) on transition to zero speed. Parameter is not applicable if **[Engage at reversal]** (b E d) = **[Yes]** (Y E 5).		
ttr ★ ◯ (1)	**[Time to restart]** Time between the end of a brake engage sequence and the start of a brake release sequence.	0.00 to 15.00 s	0 s

(1) The parameter can also be accessed in the **[SETTINGS]** (5 E t -) menu.
(2) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
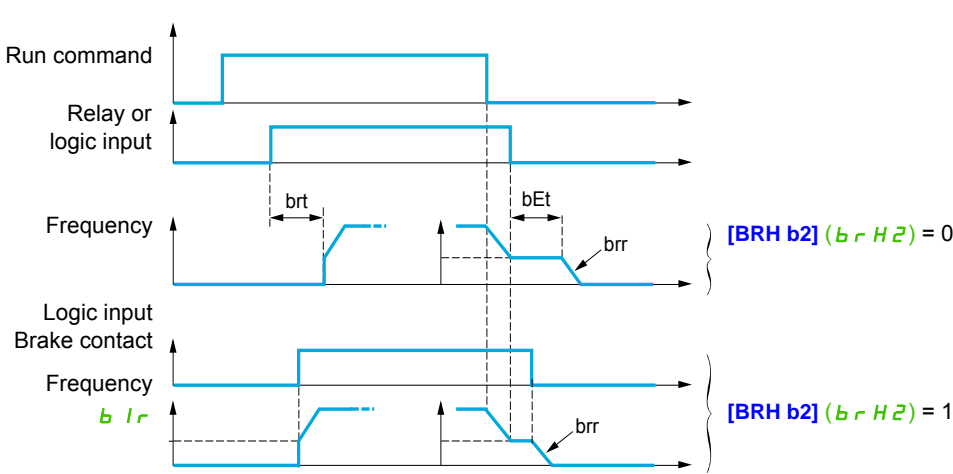

◯ Parameter that can be modified during operation or when stopped.

Brake control logic expert parameters

Following parameters for brake logic sequence are accessible in expert mode only.

Code	Name / Description	Adjustment range	Factory setting
b r H 0 ★	**[BRH b0]** Selection of the brake restart sequence if a run command is repeated while the brake is engaging. 0 — **[0]** (*0*): The engage/release sequence is completely executed 1 — **[1]** (*1*): The brake is released immediately A run command may be requested during the brake engagement phase. Whether or not the brake release sequence is executed depends on the value selected for **[BRH b0]** (*b r H 0*). **Note:** If a run command is requested during the "ttr" phase, the complete brake control sequence is initialized.		0
b r H 1 ★	**[BRH b1]** Deactivation of the brake contact in steady state fault. 0 — **[0]** (*0*): The brake contact in steady state fault is active (fault state if the contact is open during operation). The **[Brake feedback]** (*b r F*) brake contact fault is monitored in all operating phases. 1 — **[1]** (*1*): The brake contact in steady state fault is inactive. The **[Brake feedback]** (*b r F*) brake contact fault is only monitored during the brake release and engage phases.		0

	Parameters described in this page can be accessed by:		DRI- > CONF > FULL > FUN- > BLC-

Code	Name / Description	Adjustment range	Factory setting

brH2 ★	**[BRH b2]**
	
	Taking the brake contact into account for the brake control sequence.
	
	0 **[0]** (*0*): The brake contact is not taken into account
	1 **[1]** (*1*): The brake contact is taken into account
	
	If a logic input is assigned to the brake contact:
	   - **[BRH b2]** (*b r H 2*) = 0: During the brake release sequence, the reference is enabled at the end of the time **[Brake Release time]** (*b r t*). During the brake engage sequence, the current changes to 0 according to the ramp **[Current ramp time]** (*b r r*) at the end of the **[Brake engage time]** (*b E t*).
	   - **[BRH b2]** (*b r H 2*) = 1: When the brake is released, the reference is enabled when the logic input changes to 1. When the brake is engaged, the current changes to 0 according to the ramp **[Current ramp time]** (*b r r*) when the logic input changes to 0.
	
			0

brr ★ ⟳	**[Current ramp time]** Torque current ramp time (increase and decrease) for a current variation equal to **[Brake release I FW]** (*I b r*).	0 to 5.00 s	0 s

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⟳ Parameter that can be modified during operation or when stopped.

EXTERNAL WEIGHT MEASUREMENT

Load measurement

This function uses the information supplied by a weight sensor to adapt the current
[Brake release I FW] (Ibr) of the **[BRAKE LOGIC CONTROL]** ($bLC-$) function. The signal from the weight sensor can be assigned to an analog input (usually a 4 - 20 mA signal) or to the pulse-in input, according to the type of weight sensor.

Example: Measurement of the total weight of a hoisting winch and its load

The current **[Brake release I FW]** (Ibr) is adapted in accordance with the curve below.

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
ELM-	**[EXTERNAL WEIGHT MEAS.]**		
PES	**[Weight sensor ass.]**		**[No]** (nO)
	⚠ **WARNING**		
	LOSS OF CONTROL Check that **[Point 1 X]** (LP 1), **[Point 2x]** (LP 2), **[Point 1Y]** (CP 1) and **[Point 2Y]** (CP 2) are correctly set to avoid loss of control of the load being lifted. **Failure to follow these instructions can result in death, serious injury, or equipment damage.**		
	This parameter can be configured if **[BRAKE LOGIC CONTROL]** (bLC -) page 191 is not set to **[No]** (nO).		
nO	**[No]** (nO): Not assigned		
AI1	**[AI1]** (AI 1): Analog input A1		
AI2	**[AI2]** (AI 2): Analog input A2		
AI3	**[AI3]** (AI 3): Analog input A3		
PI	**[RP]** (P 1): Pulse input		
AIU1	**[AI virtual 1]** (AIU 1): Virtual analog input 1 with the jog dial		
AIU2	**[AI virtual 2]** (AIU 2): Virtual analog input 2 by the communication bus		
OAO1	**[OA01]** (OAO 1): Function blocks: Analog Output 01		
. . .	**...**		
OA10	**[OA10]** (OA 10): Function blocks: Analog Output 10		
LP1 ★	**[Point 1 X]** 0 to 99.99% of signal on assigned input. **[Point 1x]** (LP 1) must be less than **[Point 2x]** (LP 2). This parameter can be accessed if **[Weight sensor ass.]** (PES) is assigned.	0 to LP2-0.01%	0%
CP1 ★	**[Point 1Y]** Current corresponding to load **[Point 1 X]** (LP 1), in A. This parameter can be accessed if **[Weight sensor ass.]** (PES) is assigned.	-1.36 In to 1.36 In (1)	-In (1)
LP2 ★	**[Point 2X]** 0.01 to 100% of signal on assigned input. **[Point 2x]** (LP 2) must be greater than **[Point 1x]** (LP 1). This parameter can be accessed if **[Weight sensor ass.]** (PES) is assigned.	LP1+0.01% to 100%	50%
CP2 ★	**[Point 2Y]** Current corresponding to load **[Point 2x]** (LP 2), in A. This parameter can be accessed if **[Weight sensor ass.]** (PES) is assigned.	-1.36 In to 1.36 In (1)	0 A
IbrA ★ ↻	**[Ibr 4-20 mA loss]** Brake release current in the event of the loss of the weight sensor information. This parameter can be accessed if the weight sensor is assigned to an analog current input and the 4-20 mA loss is deactivated. Recommended settings: Rated motor current for a hoisting application.	0 to 1.36 In (1)	0

(1) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
↻ Parameter that can be modified during operation or when stopped.

HIGH SPEED HOISTING

This function can be used to optimize the cycle times for hoisting movements for zero or lightweight loads. It authorizes operation at "constant power" in order to reach a speed greater than the rated speed without exceeding the rated motor current.

The speed remains limited by the **[High speed]** (*H S P*) parameter page 85.

The function acts on the speed reference pedestal and not on the reference itself.

Principle:
There are 2 possible operating modes:
- Speed reference mode: The maximum permissible speed is calculated by the drive during a speed step that is set so that the drive can measure the load.
- Current limitation mode: The maximum permissible speed is the speed that supports current limitation in motor mode, in the "ascending" direction only. For the "descending" direction, operation is in Speed reference mode.

Speed reference mode
OSP: Adjustable speed step for load measurement

tOS: Load measuring time

Two parameters are used to reduce the speed calculated by the drive, for ascending and descending.

Current limiting mode
SCL: Adjustable speed threshold, above which current limitation is active

CLO: Current limitation for high-speed function

Note: The speed reached for a specific current will be lower in case of network undervoltage in comparison with nominal network voltage.

Rope slack

The Rope slack function can be used to help to prevent starting up at high speed when a load has been set down ready for lifting but the rope is still slack (as illustrated below).
The speed step (OSP parameters) described on page <u>199</u> is used to measure the load. The effective measurement cycle will not be triggered until the load reaches the adjustable threshold **[Rope slack trq level]** ($r \, 5 \, t \, L$), which corresponds to the weight of the hook.

A logic output or a relay can be assigned to the indication of the rope slack state in the **[INPUTS / OUTPUTS CFG]** ($I \_ O \-$) menu.

Code	Name / Description	Adjustment range	Factory setting

(1) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
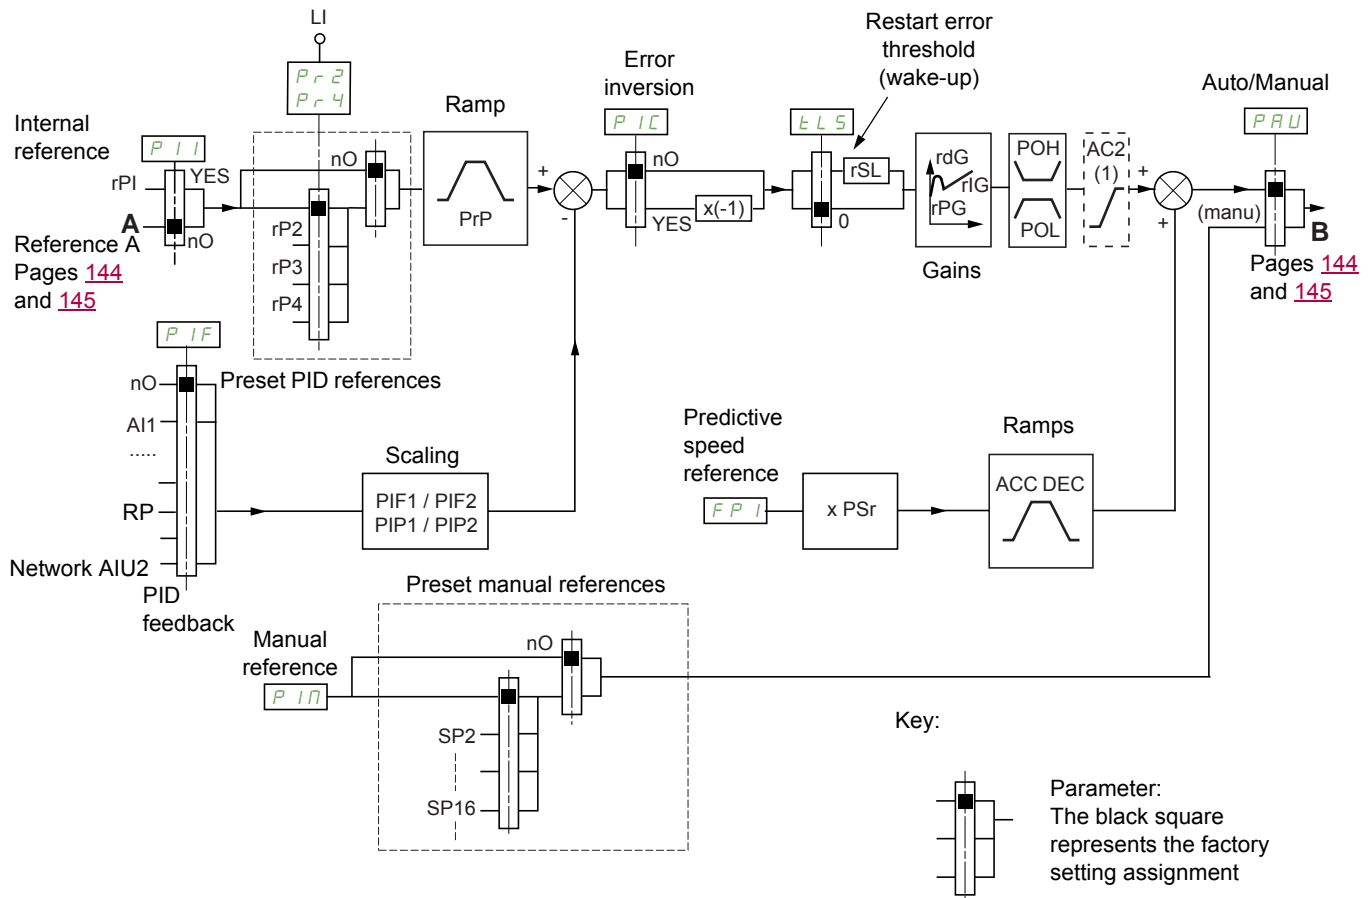

⟲ Parameter that can be modified during operation or when stopped.

PID REGULATOR

Block diagram

The function is activated by assigning an analog input to the PID feedback (measurement).

(1) Ramp AC2 is only active when the PID function starts up and during PID "wake-ups".

PID feedback:

The PID feedback must be assigned to one of the analog inputs AI1 to AI3, to the pulse input, according to whether any extension cards have been inserted.

PID reference:

The PID reference must be assigned to the following parameters: Preset references via logic inputs (rP2, rP3, rP4)

In accordance with the configuration of **[Act. internal PID ref.]** (PI1) page 207:

Internal reference (rP1) or

Reference A (**[Ref.1 channel]** (Fr1) or **[Ref.1B channel]** (Fr1b), see page 151).

Combination table for preset PID references:

LI (Pr4)	LI (Pr2)	Pr2 = nO	Reference
			rPI or A
0	0		rPI or A
0	1		rP2
1	0		rP3
1	1		rP4

A predictive speed reference can be used to initialize the speed on restarting the process.

Scaling of feedback and references:

- **[Min PID feedback]** (*P IF I*), **[Max PID feedback]** (*P IF 2*) parameters can be used to scale the PID feedback (sensor range). **This scale MUST be maintained for all other parameters.**
- **[Min PID reference]** (*P IP I*), **[Max PID reference]** (*P IP 2*) parameters can be used to scale the adjustment range, for example the reference. **The adjustment range MUST remain within the sensor range.**

The maximum value of the scaling parameters is 32,767. To facilitate installation, we recommend using values as close as possible to this maximum level, while retaining powers of 10 in relation to the actual values.

Example (see graph below): Adjustment of the volume in a tank, between 6 m^3 and 15 m^3.

- Sensor used 4-20 mA, 4.5 m^3 for 4 mA and 20 m^3 for 20 mA, with the result that *P IF I* = 4,500 and *P IF 2* = 20,000.
- Adjustment range 6 to 15 m^3, with the result that *P IP I* = 6,000 (min. reference) and *P IP 2* = 15,000 (max. reference).
- Example references:
  - rP1 (internal reference) = 9,500
  - rP2 (preset reference) = 6,500
  - rP3 (preset reference) = 8,000
  - rP4 (preset reference) = 11,200

The **[3.4 DISPLAY CONFIG.]** menu can be used to customize the name of the unit displayed and its format.
Other parameters:

- **[PID wake up thresh.]** (*r 5L*) parameter: Can be used to set the PID error threshold, above which the PID regulator will be reactivated (wake-up) after a stop due to the max. time threshold being exceeded at low speed **[Low speed time out]** (*tL 5*).
- Reversal of the direction of correction **[PID correct. reverse]** (*P IC*): If **[PID correct. reverse]** (*P IC*) is set to **[No]** (*nO*), the speed of the motor will increase when the error is positive (for example: pressure control with a compressor). If **[PID correct. reverse]** (*P IC*) is set to **[Yes]** (*YE 5*), the speed of the motor will decrease when the error is positive (for example: temperature control using a cooling fan).
- The integral gain may be short-circuited by a logic input.
- An alarm on the PID feedback may be configured and indicated by a logic output.
- An alarm on the PID error may be configured and indicated by a logic output.

"Manual - Automatic" Operation with PID

This function combines the PID regulator, the preset speeds and a manual reference. Depending on the state of the logic input, the speed reference is given by the preset speeds or by a manual reference input via the PID function.

Manual reference [Manual reference] (P I Π):
- Analog inputs AI1 to AI3
- Pulse input

Predictive speed reference [Speed ref. assign.] (F P I):
- **[AI1]** (A I I): Analog input
- **[AI2]** (A I 2): Analog input
- **[AI3]** (A I 3): Analog input
- **[RP]** (P I): Pulse input
- **[HMI]** (L C C): Graphic display terminal or remote display terminal

- **[Com. card]** (n E t): Communication card (if inserted)

Setting up the PID regulator

1. Configuration in PID mode.
See the diagram on page .

2. Perform a test in factory settings mode.
To optimize the drive, adjust **[PID prop. gain]** (r P G) or **[PID integral gain]** (r I G) gradually and independently, and observe the effect on the PID feedback in relation to the reference.

3. If the factory settings are unstable or the reference is incorrect.
- Perform a test with a speed reference in Manual mode (without PID regulator) and with the drive on load for the speed range of the system:
    - In steady state, the speed must be stable and comply with the reference, and the PID feedback signal must be stable.
    - In transient state, the speed must follow the ramp and stabilize quickly, and the PID feedback must follow the speed. If this is not the case, see the settings for the drive and/or sensor signal and wiring.
- Switch to PID mode.
- Set **[Dec ramp adapt.]** (b r A) to **[No]** (n O) (no auto-adaptation of the ramp).
- Set **[PID ramp]** (P r P) to the minimum permitted by the mechanism without triggering an **[Overbraking]** (O b F).
- Set the integral gain **[PID integral gain]** (r I G) to minimum.
- Leave the derivative gain **[PID derivative gain]** (r d G) at 0.
- Observe the PID feedback and the reference.
- Switch the drive ON/OFF a number of times or vary the load or reference rapidly a number of times.
- Set the proportional gain **[PID prop. gain]** (r P G) in order to ascertain the compromise between response time and stability in transient phases (slight overshoot and 1 to 2 oscillations before stabilizing).
- If the reference varies from the preset value in steady state, gradually increase the integral gain **[PID integral gain]** (r I G), reduce the proportional gain **[PID prop. gain]** (r P G) in the event of instability (pump applications), find a compromise between response time and static precision (see diagram).
- Lastly, the derivative gain may permit the overshoot to be reduced and the response time to be improved, although this will be more difficult to obtain a compromise in terms of stability, as it depends on 3 gains.
- Perform in-production tests over the whole reference range.
The oscillation frequency depends on the system kinematics.

TORQUE LIMITATION

There are two types of torque limitation:
*   With a value that is fixed by a parameter
*   With a value that is set by an analog input (AI or pulse)

If both types are enabled, the lowest value is taken into account. The two types of limitation can be configured or switched remotely using a logic input or via the communication bus.

Parameters described in this page can be accessed by: | DRI- > CONF > FULL > FUN- > TOL-

Code	Name / Description	Adjustment range	Factory setting
FUn -	**[APPLICATION FUNCT.] (continued)**		
tOL -	**[TORQUE LIMITATION]**		
tLA	**[Torque limit. activ.]**		**[No]** (nO)
	If the assigned input or bit is at 0, the function is inactive. If the assigned input or bit is at 1, the function is active.

(1) In corresponds to the rated drive current indicated in the Installation manual or on the drive nameplate.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

LINE CONTACTOR COMMAND

The line contactor closes every time a run command (forward or reverse) is sent and opens after every stop, as soon as the drive is locked. For example, if the stop mode is stop on ramp, the contactor will open when the motor reaches zero speed.

Note: The drive control power supply must be provided via an external 24 V source.

Example circuit:

24 V power supply
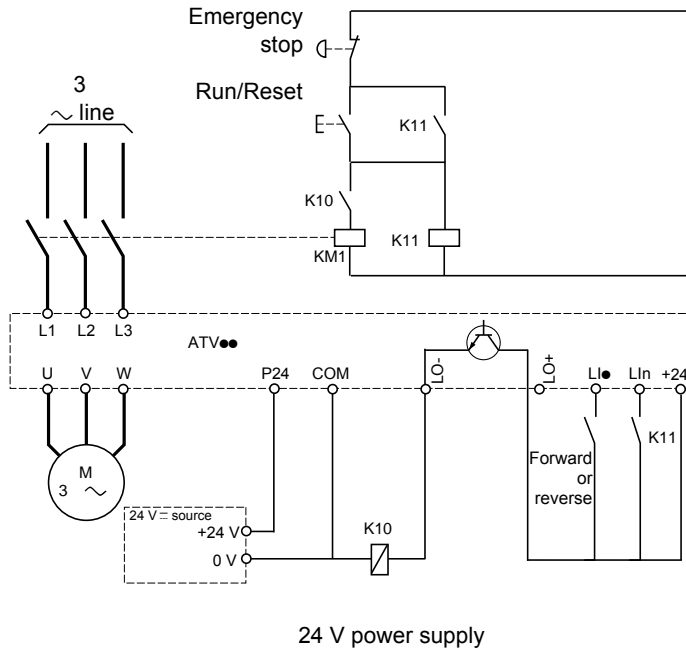

Note: The "Run/Reset" key must be pressed once the "Emergency stop" key has been released.

LI● = Run command **[Forward]** ($F r d$) or **[Reverse]** ($r r 5$)

LO-/LO+ = **[Line contactor ass.]** ($L L C$)

LIn = **[Drive lock]** ($L E S$)

CAUTION
RISK OF DAMAGE TO THE MOTOR
This function can only be used for a small number of consecutive operations with a cycle time longer than 60 s (in order to avoid premature aging of the filter capacitor charging circuit).
Failure to follow these instructions can result in equipment damage.

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
FUn-	**[APPLICATION FUNCT.]** (continued)		
LLC-	**[LINE CONTACTOR COMMAND]**		
LLC	**[Line contactor ass.]**		**[No]** (nO)
	Logic output or control relay.		
nO	**[No]** (nO): Function not assigned (in this case, none of the function parameters can be accessed)		
LO1	**[LO1]** (LO1): Logical output LO1		
r2	**[R2]** (r2): Relay r2		
dO1	**[d01]** (dO1): Analog output AO1 functioning as a logic output. Selection can be made if **[AO1 assignment]** (AO1) page 141 is set to **[No]** (nO)		
LES ★	**[Drive lock]**		**[No]** (nO)
	This parameter can be accessed if **[Line contactor ass.]** (LLC) is not set to **[No]** (nO). The drive locks when the assigned input or bit changes to 0.		
nO	**[No]** (nO): Function inactive		
L11	**[LI1]** (LI1): Logical input LI1		
. . .	**[...]** (. . .): See the assignment conditions on page 150		
LCt ★	**[Mains V. time out]**	5 to 999 s	5 s
	Monitoring time for closing of line contactor. If, once this time has elapsed, there is no voltage on the drive power circuit, the drive will lock with a **[Line contactor]** (LCF) detected fault.		

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

OUTPUT CONTACTOR COMMAND

This allows the drive to control a contactor located between the drive and the motor. The request for the contactor to close is made when a run command is sent. The request for the contactor to open is made when there is no longer any current in the motor.

CAUTION
RISK OF DAMAGE TO THE MOTOR
If a DC injection braking function has been configured, it should not be left operating too long in stop mode, as the contactor only opens at the end of braking.
Failure to follow these instructions can result in equipment damage.

Output contactor feedback

The corresponding logic input should be at 1 when there is no run command and at 0 during operation.

In the event of an inconsistency, the drive trips in FCF2 if the output contactor fails to close (LIx at 1) and in FCF1 if it is stuck (LIx at 0).

The **[Delay to motor run]** (dbS) parameter can be used to delay tripping in fault mode when a run command is sent and the **[Delay to open cont.]** (dAS) parameter delays the detected fault when a stop command is set.

Note: FCF2 (contactor failing to close) can be reset by the run command changing state from 1 to 0 (0 --> 1 --> 0 in 3-wire control).
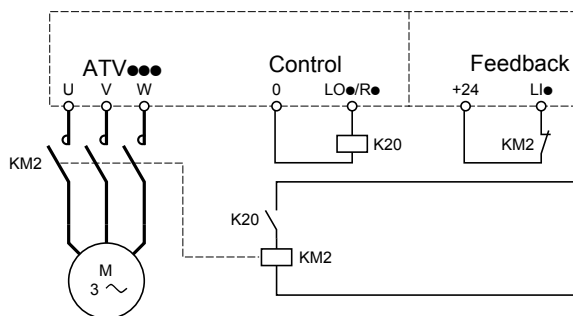

The **[Out. contactor ass.]** (OCC) and **[Output contact. fdbk]** (rCA) functions can be used individually or together.

Code	Name / Description	Adjustment range	Factory setting

OCC	**[Out. contactor ass.]**		**[No]** (nO)
	Logic output or control relay.		
nO LO1 r2 dO1	**[No]** (nO): Function not assigned (in this case, none of the function parameters can be accessed) **[LO1]** (LO1): Logical output LO1 **[R2]** (r2): Relay r2 **[dO1]** (dO1): Analog output AO1 functioning as a logic output. Selection can be made if **[AO1 assignment]** (AO1) page 141 is set to **[No]** (nO)		
rCA	**[Output contact. fdbk]**		**[No]** (nO)
	The motor starts up when the assigned input or bit changes to 0.		
nO LI1 . . .	**[No]** (nO): Function inactive **[LI1]** (LI1): Logical input LI1 **[...]** (. . .): See the assignment conditions on page 150		
dbS	**[Delay to motor run]**	0.05 to 60 s	0.15 s
★ ()	Time delay for: Motor control following the sending of a run command Output contactor state monitoring, if the feedback is assigned. If the contactor fails to close at the end of the set time, the drive will lock in FCF2 mode. This parameter can be accessed if **[Out. contactor ass.]** (OCC) is assigned or if **[Output contact. fdbk]** (rCA) is assigned. The time delay must be greater than the closing time of the output contactor.		
dAS	**[Delay to open cont.]**	0 to 5.00 s	0.10 s
★ ()	Time delay for output contactor opening command following motor stop. This parameter can be accessed if **[Output contact. fdbk]** (rCA) is assigned. The time delay must be greater than the opening time of the output contactor. If it is set to 0, the detected fault will not be monitored. If the contactor fails to open at the end of the set time, the drive will lock in FCF1 fault mode.		

★   These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

()   Parameter that can be modified during operation or when stopped.

POSITIONING BY SENSORS

This function is used for managing positioning using position sensors or limit switches linked to logic inputs or using control word bits:

- Slowing down
- Stopping

The action logic for the inputs and bits can be configured on a rising edge (change from 0 to 1) or a falling edge (change from 1 to 0). The example below has been configured on a rising edge:
The slowdown mode and stop mode can be configured.

The operation is identical for both directions of operation. Slowdown and stopping operate according to the same logic, described below.

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > FUN- > LPO-

Example: Forward slowdown, on rising edge

- Forward slowdown takes place on a rising edge (change from 0 to 1) of the input or bit assigned to forward slowdown if this rising edge occurs in forward operation. The slowdown command is then memorized, even in the event of a power outage. Operation in the opposite direction is authorized at high speed. The slowdown command is deleted on a falling edge (change from 1 to 0) of the input or bit assigned to forward slowdown if this falling edge occurs in reverse operation.
- A bit or a logic input can be assigned to disable this function.
- Although forward slowdown is disabled while the disable input or bit is at 1, sensor changes continue to be monitored and saved.

Example: Positioning on a limit switch, on rising edge

Reverse stop Reverse slowdown Reverse Forward Forward slowdown Forward stop
Operation with short cams:

⚠ WARNING

LOSS OF CONTROL

When operating for the first time or after restoring the factory settings, the drive must initially be started outside the slowdown and stop zones in order to initialize the function.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

⚠ WARNING

LOSS OF CONTROL

The current zone is memorized at power off.

In case of manual modification of the system position, the drive must be started at the same position at the next power up of the drive.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

In this instance, when operating for the first time or after restoring the factory settings, the drive must initially be started outside the slowdown and stop zones in order to initialize the function.

Forward slowdown zone

Forward slowdown

Forward stop zone

Forward stop

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > FUN- > LPO-

Operation with long cams:

In this instance, there is no restriction, which means that the function is initialized across the whole trajectory.

Forward slowdown zone

Forward slowdown
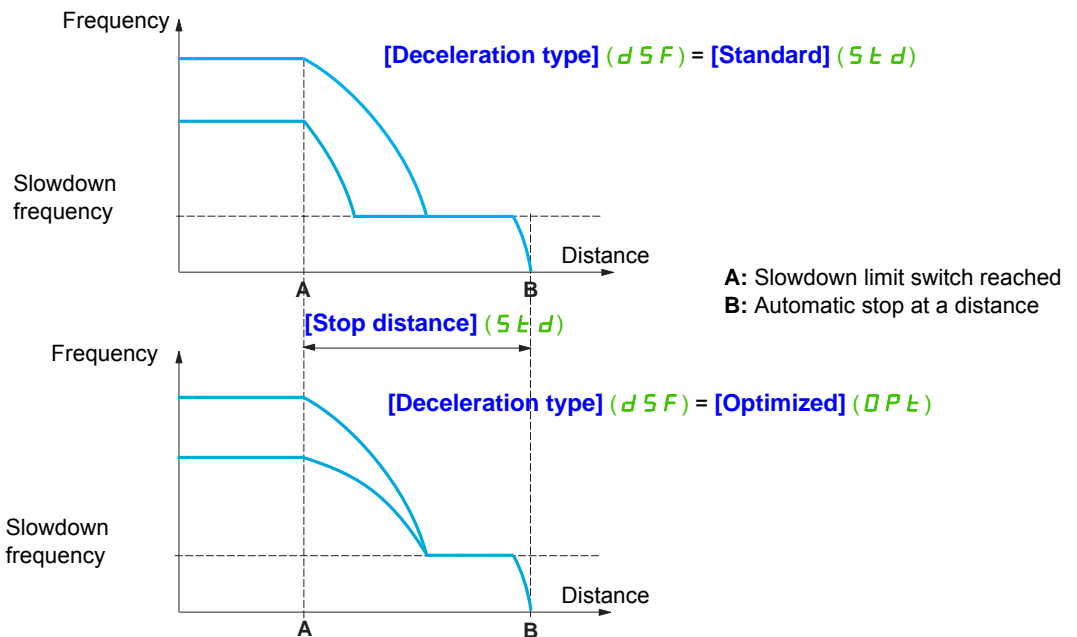

Forward stop zone

Forward stop
Stop at distance calculated after deceleration limit switch

This function can be used to control the stopping of the moving part automatically once a preset distance has been traveled after the slowdown limit switch.

On the basis of the rated linear speed and the speed estimated by the drive when the slowdown limit switch is tripped, the drive will induce the stop at the configured distance.

This function is useful in applications where one manual-reset overtravel limit switch is common to both directions. It will then only respond to help management if the distance is exceeded. The stop limit switch retains priority in respect of the function.

The **[Deceleration type]** ($d\, 5\, F$) parameter can be configured to obtain either of the functions described below:

Frequency

[Deceleration type] ($d\, 5\, F$) = **[Standard]** ($5\, k\, d$)

Slowdown frequency

Distance

A   B

A: Slowdown limit switch reached
B: Automatic stop at a distance

[Stop distance] ($5\, k\, d$)

Frequency

[Deceleration type] ($d\, 5\, F$) = **[Optimized]** ($D\, P\, k$)

Slowdown frequency

Distance

A   B

Note:
- If the deceleration ramp is modified while stopping at a distance is in progress, this distance will not be observed.
- If the direction is modified while stopping at a distance is in progress, this distance will not be observed.

⚠ **WARNING**

LOSS OF CONTROL
- Check that the parameters configured are consistent (in particular, you should check that the required distance is possible).
- This function does not replace the stop limit switch, which remains necessary for safety reasons.
Failure to follow these instructions will result in death, serious injury, or equipment damage.

S t d ★	**[Stop distance]**		**[No]** (n O)
	This parameter can be accessed if at least one limit switch or one sensor has been assigned. Activation and adjustment of the "Stop at distance calculated after the slowdown limit switch" function.		
n O -	**[No]** (n O): Function inactive (the next two parameters will, therefore, be inaccessible) **0.01 to 10.00**: Stop distance range in meters		
n L S ★	**[Rated linear speed]**	0.20 to 5.00 m/s	1.00 m/s
	This parameter can be accessed if at least one limit switch or one sensor has been assigned and **[Stop distance]** (S t d) is not set to **[No]** (n O). Rated linear speed in meters/second.		
S F d ★	**[Stop corrector]**	50 to 200%	100%
	This parameter can be accessed if at least one limit switch or one sensor has been assigned and **[Stop distance]** (S t d) is not set to **[No]** (n O). Scaling factor applied to the stop distance to compensate, for example, a non-linear ramp.		
П S t P ★	**[Memo Stop]**		**[No]** (n O)
	This parameter can be accessed if at least one limit switch or one sensor has been assigned. With or whithout memorisation stop switch		
n O Y E S	**[No]** (n O): No memorisation of limit switch **[YES]** (Y E S): Memorisation of limit switch		
P r S t ★	**[Priority restart]**		**[No]** (n O)
	This parameter can be accessed if at least one limit switch or one sensor has been assigned. Priority given to the starting even if switch stop is activated.		
n O Y E S	**[No]** (n O): No priority restart if stop switch is activated **[YES]** (Y E S): Priority to restart even if stop switch is activated This parameter is forced to [No] (n O) if [Memo Stop] (П S t P) is set to [YES] (Y E S).		

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

PARAMETER SET SWITCHING

A set of 1 to 15 parameters from the **[SETTINGS]** (5 E E -) menu on page 87 can be selected and 2 or 3 different values assigned. These 2 or 3 sets of values can then be switched using 1 or 2 logic inputs or control word bits. This switching can be performed during operation (motor running).

It can also be controlled on the basis of 1 or 2 frequency thresholds, whereby each threshold acts as a logic input (0 = threshold not reached, 1 = threshold reached).

	Values 1	Values 2	Values 3
Parameter 1 Parameter 2 Parameter 3 Parameter 4 Parameter 5 Parameter 6 Parameter 7 Parameter 8 Parameter 9 Parameter 10 Parameter 11 Parameter 12 Parameter 13 Parameter 14 Parameter 15	Parameter 1 Parameter 2 Parameter 3 Parameter 4 Parameter 5 Parameter 6 Parameter 7 Parameter 8 Parameter 9 Parameter 10 Parameter 11 Parameter 12 Parameter 13 Parameter 14 Parameter 15	Parameter 1 Parameter 2 Parameter 3 Parameter 4 Parameter 5 Parameter 6 Parameter 7 Parameter 8 Parameter 9 Parameter 10 Parameter 11 Parameter 12 Parameter 13 Parameter 14 Parameter 15	Parameter 1 Parameter 2 Parameter 3 Parameter 4 Parameter 5 Parameter 6 Parameter 7 Parameter 8 Parameter 9 Parameter 10 Parameter 11 Parameter 12 Parameter 13 Parameter 14 Parameter 15
Input LI or bit or frequency threshold 2 values	0	1	0 or 1
Input LI or bit or frequency threshold 3 values	0	0	1

Note: Do not modify the parameters in the **[SETTINGS]** (5 E E -) menu, because any modifications made in this menu (**[SETTINGS]** (5 E E -)) will be lost on the next power-up. The parameters can be adjusted during operation in the **[PARAM. SET SWITCHING]** (∏ L P -) menu, on the active configuration.

Note: Parameter set switching cannot be configured from the integrated display terminal.

Parameters can only be adjusted on the integrated display terminal if the function has been configured previously via the graphic display terminal, by PC Software or via the bus or communication network. If the function has not been configured, the **[PARAM. SET SWITCHING]** (∏ L P -) menu and the **[SET 1]** (P 5 1 -), **[SET 2]** (P 5 2 -), **[SET 3]** (P 5 3 -) submenus will not appear.

P S 3 -	**[SET 3]**		
★ S 3 0 1 . . . S 3 1 5	This parameter can be accessed if **[3 parameter sets]** (C H A 2) is not **[No]** (n O) and if at least 1 parameter has been selected in **[PARAMETER SELECTION]**. Identical to **[SET 1]** (P S 1 -) page 227.		

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

◯ Parameter that can be modified during operation or when stopped.

Note: We recommend that a parameter set switching test is carried out while stopped and a check is made to verify that it has been performed correctly.

Some parameters are interdependent and in this case may be restricted at the time of switching.

Interdependencies between parameters must be respected, **even between different sets**.

Example: The highest **[Low speed]** (L S P) must be below the lowest **[High speed]** (H S P).

MULTIMOTORS / MULTICONFIGURATIONS

Motor or configuration switching [MULTIMOTORS/CONFIG.] (*ΠΠC-*)

The drive may contain up to 3 configurations, which can be saved using the

[FACTORY SETTINGS] (*FCS-*) menu, page <u>79.</u>

Each of these configurations can be activated remotely, enabling adaptation to:
- 2 or 3 different motors or mechanisms (multimotor mode)
- 2 or 3 different configurations for a single motor (multiconfiguration mode)

The two switching modes cannot be combined.

Note: The following conditions MUST be observed:
- Switching may only take place when stopped (drive locked). If a switching request is sent during operation, it will not be executed until the next stop.
- In the event of motor switching, the following additional conditions apply:
  - When the motors are switched, the power and control terminals concerned must also be switched as appropriate.
  - The maximum power of the drive must not be exceeded by any of the motors.
- All the configurations to be switched must be set and saved in advance in the same hardware configuration, this being the definitive configuration (option and communication cards). Failure to follow this instruction can cause the drive to lock on an **[Incorrect config.]** (*CFF*) state.

Menus and parameters switched in multimotor mode

- **[SETTINGS]** (*SEt-*)
- **[MOTOR CONTROL]** (*drC-*)
- **[INPUTS / OUTPUTS CFG]** (*I_O-*)
- **[COMMAND]** (*CtL-*)
- **[APPLICATION FUNCT.]** (*Fun-*) with the exception of the **[MULTIMOTORS/CONFIG.]** function (to be configured once only)
- **[FAULT MANAGEMENT]** (*FLt*)
- **[MY MENU]**
- **[USER CONFIG.]**: The name of the configuration specified by the user in the **[FACTORY SETTINGS]** (*FCS-*) menu

Menus and parameters switched in multiconfiguration mode

As in multimotor mode, except for the motor parameters that are common to the 3 configurations:
- Rated current
- Thermal current
- Rated voltage
- Rated frequency
- Rated speed
- Rated power
- IR compensation
- Slip compensation
- Synchronous motor parameters
- Type of thermal protection
- Thermal state
- The auto-tuning parameters and motor parameters that can be accessed in expert mode
- Type of motor control

Note: No other menus or parameters can be switched.

Transfer of a drive configuration to another one, with graphic display terminal, when the drive uses [MULTIMOTORS/CONFIG.] (*ΠΠC-*) **function**

Let A be the source drive and B the drive addressed. In this example, switching is controlled by logic input.

1. Connect graphic display terminal to the drive A.

2. Put logic input LI (**[2 Configurations]** (*CnF 1*)) and LI (**[3 Configurations]** (*CnF 2*)) to 0.

3. Download configuration 0 in a file of graphic display terminal (example: file 1 of the graphic display terminal).

4. Put logic input LI (**[2 Configurations]** (*CnF 1*)) to 1 and leave logic input LI (**[3 Configurations]** (*CnF 2*)) to 0.

5. Download configuration 1 in a file of graphic display terminal (example: file 2 of the graphic display terminal).

6. Put logic input LI (**[3 Configurations]** (*CnF 2*)) to 1 and leave logic input LI (**[2 Configurations]** (*CnF 1*)) to 1.

7. Download configuration 2 in a file of graphic display terminal (example: file 3 of the graphic display terminal).

8. Connect graphic display terminal to the drive B.

9. Put logic input LI (**[2 Configurations]** (*CnF 1*)) and LI (**[3 Configurations]** (*CnF 2*)) to 0.

10. Make a factory setting of the drive B.

11. Download the configuration file 0 in the drive (file 1 of graphic display terminal in this example).

12. Put logic input LI (**[2 Configurations]** (*CnF 1*)) to 1 and leave logic input LI (**[3 Configurations]** (*CnF 2*)) to 0.

13. Download the configuration file 1 in the drive (file 2 of graphic display terminal in this example).

14. Put logic input LI (**[3 Configurations]** (*CnF 2*)) to 1 and leave logic input LI (**[2 Configurations]** (*CnF 1*)) to 1.

15. Download the configuration file 2 in the drive (file 3 of graphic display terminal in this example).

Note: Steps 6, 7, 14 et 15 are necessary only if **[MULTIMOTORS/CONFIG.]** (*ΠΠC-*) function is used with 3 configurations or 3 motors.
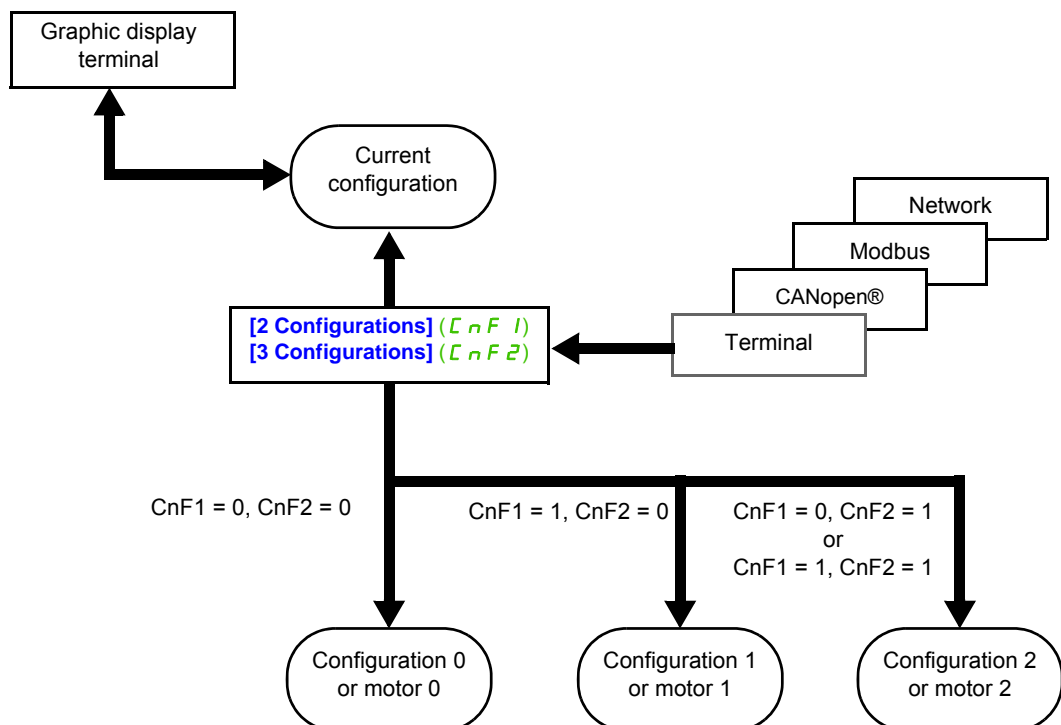

Switching command

Depending on the number of motors or selected configurations (2 or 3), the switching command is sent using one or two logic inputs. The table below lists the possible combinations.

LI 2 motors or configurations	LI 3 motors or configurations	Number of configurations or active motors
0	0	0
1	0	1
0	1	2
1	1	2

Schematic diagram for multimotor mode
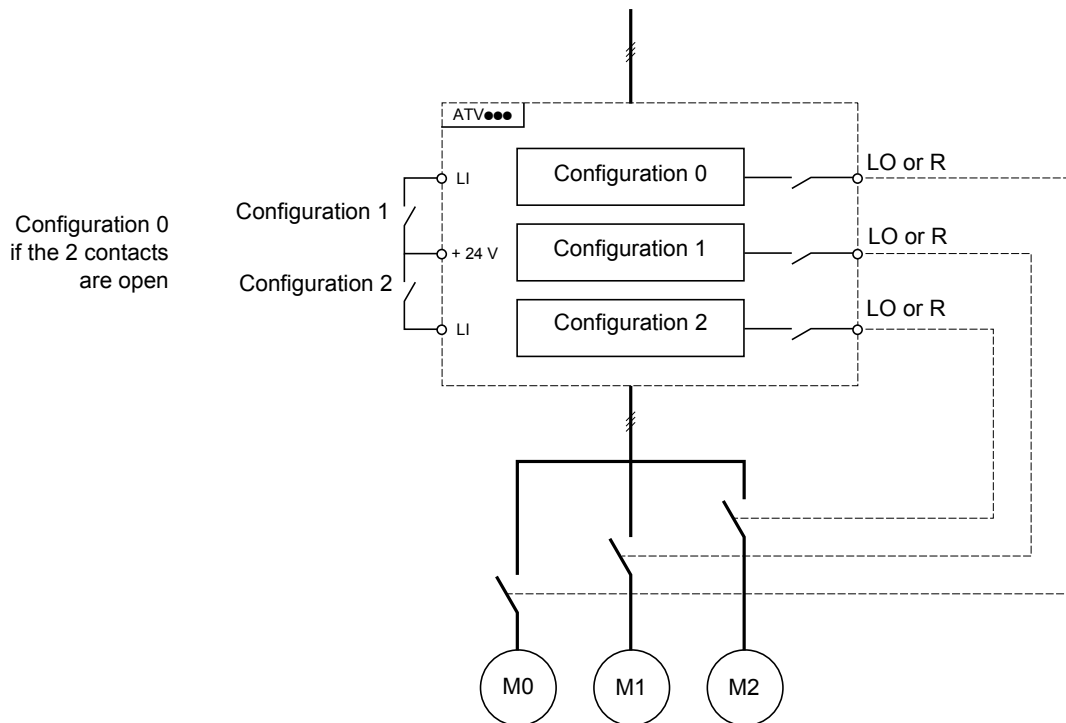

Auto-tuning in multimotor mode

This auto-tuning can be performed:
- Manually using a logic input when the motor changes.
- Automatically each time the motor is activated for the 1st time after switching on the drive, if the **[Automatic autotune]** (*A U t*) parameter on page 106 is set to **[Yes]** (*Y E S*).

Motor thermal states in multimotor mode:

The drive helps to protect the three motors individually. Each thermal state takes into account all stop times, if the drive power is not switched off.

Configuration information output

<table>
<tr><td colspan="2" align="center">

CAUTION

</td></tr>
<tr><td colspan="2">

RISK OF DAMAGE TO THE MOTOR

The motor thermal state of each motor is not memorized when power is switched off.

To continue to protect the motors, it is required to:

• Perform auto-tuning on each motor every time the power is switched on,

or

• Use an external overload protection on each motor.

Failure to follow these instructions can result in equipment damage.

</td></tr>
</table>

In the **[INPUTS / OUTPUTS CFG]** (I_O-) menu, a logic output can be assigned to each configuration or motor (2 or 3) for remote information transmission.

Note: As the **[INPUTS / OUTPUTS CFG]** (I_O-) menu is switched, these outputs must be assigned in all configurations in which information is required.

TRAVERSE CONTROL

Function for winding reels of yarn (in textile applications):

Traverse control drive

Winding drive

Reel of yarn

Main shaft

Winding motor

Gearbox

Thread guide

Thread

Traverse control motor

Gearbox

Cam
The speed of rotation of the cam must follow a precise profile to ensure that the reel is steady, compact and linear:

Run command

LI or traverse control bit

Motor speed

Base reference

ACC ramp

dEC ramp

Start of function

End of function

Bit 15 of word LRS1 (traverse control active)
The function starts when the drive has reached its base reference and the traverse control command has been enabled.

When the traverse control command is disabled, the drive returns to its base reference, following the ramp determined by the traverse control function. The function then stops, as soon as it has returned to this reference.

Bit 15 of word LRS1 is at 1 while the function is active.

Function parameters

These define the cycle of frequency variations around the base reference, as shown in the diagram below:
t r C	**[Yarn control]** (t r C): Assignment of the traverse control command to a logic input or to a communication bus control word bit
t r H	**[Traverse freq. high]** (t r H): in Hertz
t r L	**[Traverse Freq. Low]** (t r L): in Hertz
q S H	**[Quick step High]** (q S H): in Hertz
q S L	**[Quick step Low]** (q S L): in Hertz
t U P	**[Traverse ctrl. accel.]** (t U P): time, in seconds
t d n	**[Traverse ctrl. decel]** (t d n): time, in seconds

Reel parameters:

t b O	**[Reel time]** (t b O): Time taken to make a reel, in minutes. This parameter is intended to signal the end of winding. When the traverse control operating time since command **[Yarn control]** (t r C) reaches the value of **[Reel time]** (t b O), the logic output or one of the relays changes to state 1, if the corresponding function **[End reel]** (E b O) has been assigned. The traverse control operating time E b O t can be monitored online by a communication bus.
d t F	**[Decrease ref. speed]** (d t F): Decrease in the base reference. In certain cases, the base reference has to be reduced as the reel increases in size. The **[Decrease ref. speed]** (d t F) value corresponds to time **[Reel time]** (t b O). Once this time has elapsed, the reference continues to fall, following the same ramp. If low speed **[Low speed]** (L S P) is at 0, the speed reaches 0 Hz, the drive stops and must be reset by a new run command. If low speed **[Low speed]** (L S P) is not 0, the traverse control function continues to operate above **[Low speed]** (L S P).

r t r **[Init. traverse ctrl]** Reinitialize traverse control.

This command can be assigned to a logic input or to a communication bus control word bit. It resets the E b O alarm and the E b O t operating time to 0 and reinitializes the reference to the base reference. As long as r t r remains at 1, the traverse control function is disabled and the speed remains the same as the base reference. This command is used primarily when changing reels.

Counter wobble
Master drive   Slave drive
The Counter wobble function is used in certain applications to obtain a constant yarn tension when the Traverse control function is producing considerable variations in speed on the yarn guide motor (**[Traverse freq. high]** (*ᵗ ᵣ H*) and **[Traverse Freq. low]** (*ᵗ ᵣ L*), see **[Traverse freq. high]** (*ᵗ ᵣ H*) page 239).

Two motors must be used (one master and one slave).

The master controls the speed of the yarn guide, the slave controls the winding speed. The function assigns the slave a speed profile, which is in antiphase to that of the master. This means that synchronization is required, using one of the master's logic outputs and one of the slave's logic inputs.
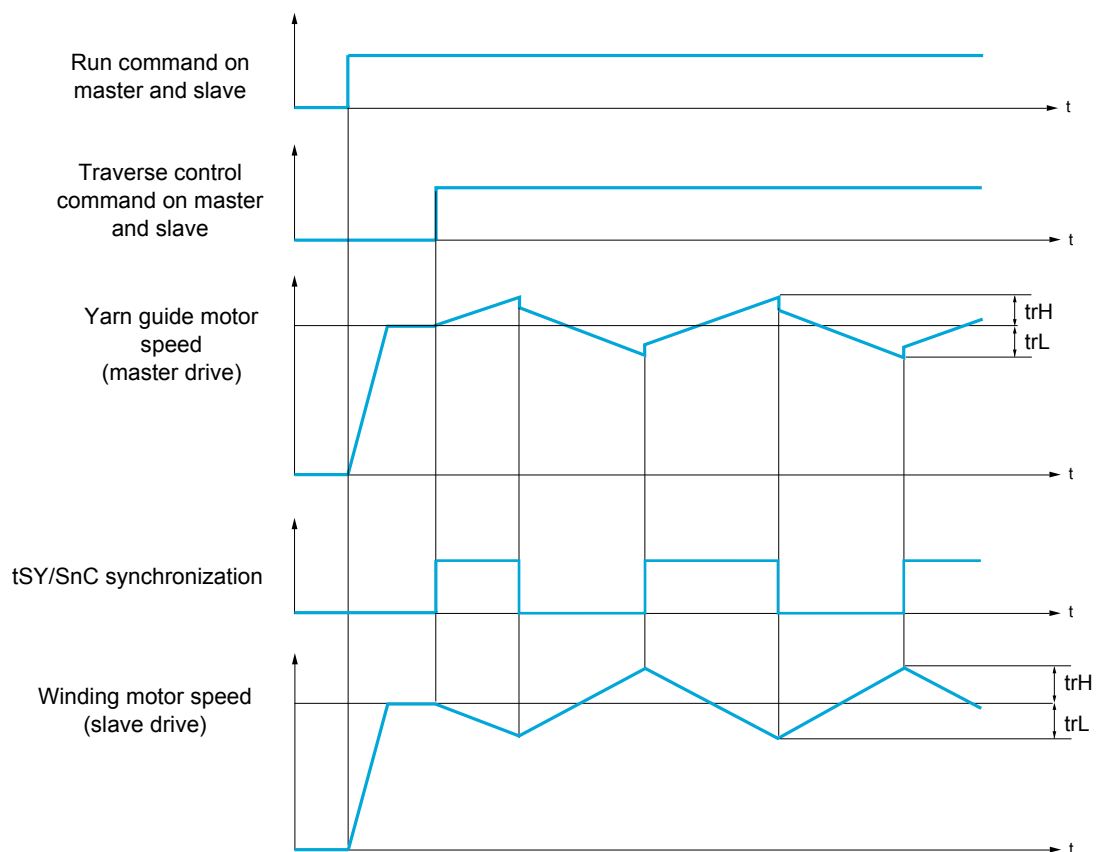

Connection of synchronization I/O
The starting conditions for the function are:

- Base speeds reached on both drives
- **[Yarn control]** (trC) input activated
- Synchronization signal present

Note: The **[Quick step High]** (qSH) and **[Quick step Low]** (qSL) parameters should generally be kept at 0.

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting

From *ConF* menu
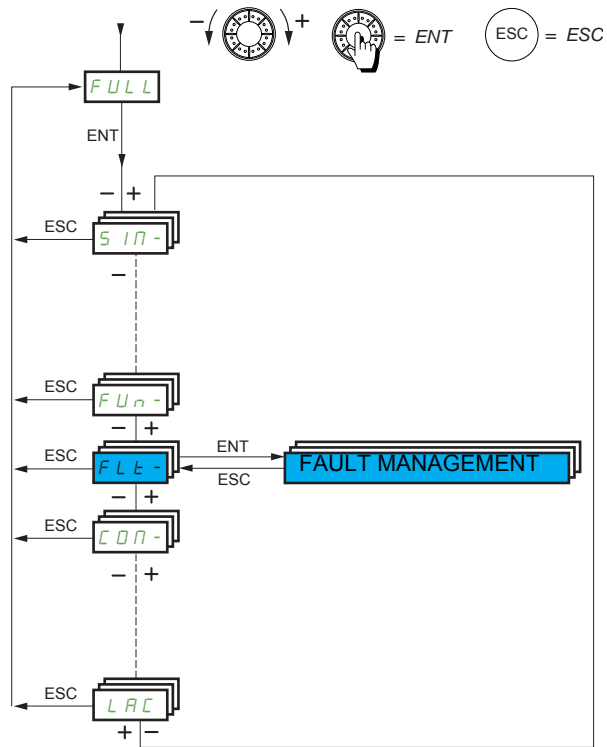

The parameters in the **[FAULT MANAGEMENT]** (*FLt -*) menu can only be modified when the drive is stopped and there is no run command, except for parameters with a ◯ symbol in the code column, which can be modified with the drive running or stopped.

Parameters described in this page can be accessed by:	

PTC probe

1 set of PTC probe can be managed by the drive in order to help to protect the motor: on logic input LI6 converted for this use by switch SW2 on the control block.

The PTC probe is monitored for the following detected faults:
- Motor overheating
- Sensor break
- Sensor short-circuit

Protection via PTC probe does not disable protection via I^2t calculation performed by the drive (the two types of protection can be combined).

Code	Name / Description	Adjustment range	Factory setting
FULL	**[FULL]** (continued)		
FLt -	**[FAULT MANAGEMENT]**		
PtC -	**[PTC MANAGEMENT]**		
PtCL	**[LI6 = PTC probe]** Check first that the switch SW2 on the control block is set to PTC.		**[No]** (*nO*)
nO *AS* *rdS* *rS*	**[No]** (*nO*): Not used **[Always]** (*AS*): PTC probe are monitored permanently, even if the power supply is not connected (as long as the control remains connected to the power supply) **[Power ON]** (*rdS*): PTC probe are monitored while the drive power supply is connected **[Motor ON]** (*rS*): PTC probe are monitored while the motor power supply is connected		
FLt -	**[FAULT MANAGEMENT]** (continued)		
rSt -	**[FAULT RESET]**		
rSF	**[Fault reset]** Detected faults are cleared manually when the assigned input or bit changes to 1, if the cause of the detected fault has disappeared. The STOP/RESET key on the graphic display terminal performs the same function. Following detected faults can be cleared manually : *ASF, brF, bLF, CnF, COF, dLF, EPF1, EPF2, FbES, FCF2, InF9, InFA, InFb, LCF, LFF3, ObF, OHF, OLC, OLF, OPF1, OPF2, OSF, OtFL, PHF, PtFL, SCF4, SCF5, SLF1, SLF2, SLF3, SOF, SPF, SSF, tJF, tnF* and *ULF*. **Note:** If [Reset restricted fault configuration] (*HrFC*) is set to [Yes] (*YES*), the additional following detected fault can be cleared manually: *OCF, SCF1, SCF3*. See page 248		**[No]** (*nO*)
nO *LI1* *. . .*	**[No]** (*nO*): Function inactive **[Yes]** (*YES*): Logical input LI1 **[...]** (*. . .*): See the assignment conditions on page 150

Can be used to select the access level of [Fault reset] (⌐ S F) to reset detected faults without having to disconnect the drive from the power supply. see page 247 **Note**: If **[Reset restricted fault configuration]** (H ⌐ F C) is set to **[Yes]** (Y E S), the additional following detected fault can be cleared manually: O C F, S C F 1, S C F 3.		
⌐ 0 Y E S	**[No]** (⌐ 0): Function inactive **[Yes]** (Y E S): Function active		

Configuration Mode (ConF)

	Parameters described in this page can be accessed by:

Code	Name / Description		Adjustment range	Factory setting
FLt-	**[FAULT MANAGEMENT]** (continued)			
Atr-	**[AUTOMATIC RESTART]**			
Atr	**[Automatic restart]**			**[No]** (nO)
⏳ 2 s	⚠ **DANGER**			
	UNINTENDED EQUIPMENT OPERATION			
	• The automatic restart can only be used on machines or installations which do not pose any danger to either personnel or equipment.			
	• If the automatic restart is activated, R1 will only indicate a fault has been detected once the time-out period for the restart sequence has expired.			
	• The equipment must be used in compliance with national and regional safety regulations.			
	Failure to follow these instructions will result in death or serious injury.			
	The drive fault relay remains activated if this function is active. The speed reference and the operating direction must be maintained.			
	Use 2-wire control (**[2/3 wire control]** (tCC) is set to **[2 wire]** (2C) and **[2 wire type]** (tCt) is set to **[Level]** (LEL), see **[2/3 wire control]** (tCC) page 83).			
	If the restart has not taken place once the configurable time tAr has elapsed, the procedure is aborted and the drive remains locked until it is turned off and then on again.			
	The fault codes, which permit this function, are listed on page 309.			
nO	**[No]** (nO): Function inactive			
YES	**[Yes]** (YES): Automatic restart, after locking in fault state, if the detected fault has disappeared and the other operating conditions permit the restart. The restart is performed by a series of automatic attempts separated by increasingly longer waiting periods: 1 s, 5 s, 10 s, then 1 minute for the following attempts.			
tAr	**[Max. restart time]**			**[5 minutes]** (5)
★	This parameter appears if **[Automatic restart]** (Atr) is set to **[Yes]** (YES). It can be used to limit the number of consecutive restarts on a recurrent detected fault.			
5	**[5 min]** (5): 5 minutes			
10	**[10 minutes]** (10): 10 minutes

ttH	**[High torque thd.]**		-300 to 300%	100%
↻	High torque frequency threshold.			
ttL	**[Low torque thd.]**		-300 to 300%	50%
↻	Low torque frequency threshold.			

Parameters described in this page can be accessed by:		DRI- > CONF > FULL > FLT- >THT-	

Code	Name / Description	Adjustment range	Factory setting
F9L ★	**[Pulse warning thd.]**	0 to 20,000 Hz	0 Hz
	Frequency level. Visible if **[Frequency meter]** (F9F) is not **[No]** (nO).		
FLt -	**[FAULT MANAGEMENT]** (continued)		
FLr -	**[CATCH ON THE FLY]**		
	Note: This function cannot be used with certain other functions. Follow the instructions on page 159.		
FLr	**[Catch on the fly]**		**[No]** (nO)

	Used to enable a smooth restart if the run command is maintained after the following events:
	    - Loss of line supply or disconnection.
	    - Clearance of current detected fault or automatic restart.
	    - Freewheel stop.
	The speed given by the drive resumes from the estimated speed of the motor at the time of the restart, then follows the ramp to the reference speed.
	This function requires 2-wire level control.
	When the function is operational, it activates at each run command, resulting in a slight delay of the current (0.5 s max).
	[Catch on the fly] (FLr) is forced to **[No]** (nO) if brake logic control **[Brake assignment]** (bLC) is assigned (page 191) or if **[Auto DC injection]** (AdC) is set to **[Continuous]** (Ct) page 173 .		

nO YES	**[No]** (nO): Function inactive **[Yes]** (YES): Function active		

(1) In corresponds to the rated drive current indicated in the Installation manual and on the drive nameplate.

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.
⟳	Parameter that can be modified during operation or when stopped.
⧖ 2 s	To change the assignment of this parameter, press the ENT key for 2 s.

Motor thermal protection

Function

Thermal protection by calculating the I²t.

Note: The motor thermal state is not saved when the drive is switched off.

- Self-cooled motors: The tripping curves depend on the motor frequency.
- Force-cooled motors: Only the 50 Hz tripping curve needs to be considered, regardless of the motor frequency.

The following curves represent the trip time in seconds:.

Trip time in seconds

Motor current / ItH
CAUTION

RISK OF DAMAGE TO THE MOTOR

External protection against overloads is required under the following circumstances:
- When the product is being switched on again, as there is no memory to record the motor thermal state
- When supplying more than one motor
- When supplying motors with ratings less than 0.2 times the nominal drive current
- When using motor switching

Failure to follow these instructions can result in equipment damage.

Parameters described in this page can be accessed by:

Deferred stop on thermal alarm

This function helps to prevent the drive stopping between two steps of the process if the drive or motor overheats, by authorizing operation until the next stop. At the next stop, the drive is locked until the thermal state falls back to a value, which undershoots the set threshold by 20%. Example: A trip threshold set at 80% enables reactivation at 60%.

One thermal state threshold must be defined for the drive, and one thermal state threshold for the motor(s), which will trip the deferred stop.

InH -	**[FAULT INHIBITION]**		
InH	**[Fault inhibit assign.]**		**[No]** (n O)

⚠ **DANGER**

LOSS OF PERSONNEL AND EQUIPMENT PROTECTION
Enabling **[Fault inhibit assign.]** (InH) will disable the drive controller protection features.
• **[Fault inhibit assign.]** (InH) should not be enabled for typical applications of this equipment.
• **[Fault inhibit assign.]** (InH) should be enabled only in extraordinary situations where a thorough risk analysis demonstrates that the presence of adjustable speed drive protection poses a greater risk than personnel injury or equipment damage.
Failure to follow these instructions will result in death or serious injury.

If the assigned input or bit is at 0, detected fault monitoring is active. If the assigned input or bit is at 1, fault monitoring is inactive. Active detected faults are cleared on a rising edge (change from 0 to 1) of the assigned input or bit.
Note: The Safe Torque Off function and any detected faults that help to prevent any form of operation are not affected by this function.
Following faults can be inhibited:
AnF, CnF, COF, CrF1, dLF, EnF, EPF1, EPF2, FCF2, InFA, InFb, LFF3, ObF, OHF, OLC, OLF, OPF1, OPF2, OSF, OtFL, PHF, PtFL, SLF1, SLF2, SLF3, SOF, SPF, SSF, tJF, tnF and ULF.

Use of the "Pulse input" input to measure the speed of rotation of the motor

This function uses the "Pulse input" input and can only be used if the "Pulse input" input is not being used for another function.

Example of use

An indexed disk driven by the motor and connected to a proximity sensor can be used to generate a frequency signal that is proportional to the speed of rotation of the motor.
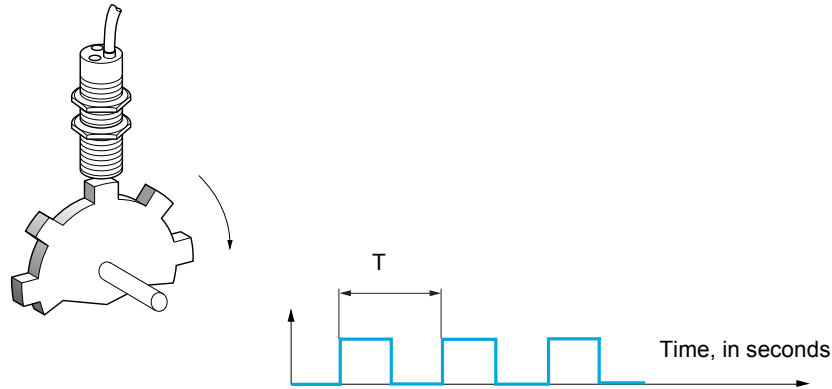

When applied to the "Pulse input" input, this signal supports:

- Measurement and display of the motor speed: signal frequency = 1/T. This frequency is displayed by means of the **[Pulse in. work. freq.]** ($F95$) parameter, page 48.
- Overspeed detection (if the measured speed exceeds a preset threshold, the drive will trip).
- Brake failure detection, if brake logic control has been configured: If the speed does not drop sufficiently quickly following a command to engage the brake, the drive will trip. This function can be used to detect worn brake linings.
- Detection of a speed threshold that can be adjusted using **[Pulse warning thd.]** ($F9L$) page 99 and is assignable to a relay or logic output, see page 135.

Parameters described in this page can be accessed by: DRI- > CONF > FULL > FLT- > TNF-

Code	Name / Description	Adjustment range	Factory setting
FLT-	**[FAULT MANAGEMENT]** (continued)		
F9F-	**[FREQUENCY METER]**		
F9F	**[Frequency meter]**		**[No]** (nO)
	Activation of the speed measurement function.		
nO YES	**[No]** (nO): Function inactive. In this case, none of the function parameters can be accessed **[Yes]** (YES): Function active, assignment only possible if no other functions have been assigned to the "Pulse input" input		
F9C ()	**[Pulse scal. divisor]**	1.0 to 100.0	1.0
	Scaling factor for the "Pulse input" input (divisor). The frequency measured is displayed by means of the **[Pulse in. work. freq.]** (F95) parameter, page 48.		
F9A	**[Overspd. pulse thd.]**		**[No]** (nO)
	Activation and adjustment of overspeed monitoring: **[Overspeed]** (SOF).		
nO -	**[No]** (nO): No overspeed monitoring **1 Hz to 20.00 kHz**: Adjustment of the frequency tripping threshold on the "Pulse input" input divided by **[Pulse scal. divisor]** (F9C).		
tdS	**[Pulse overspd delay]**	0.0 s to 10.0 s	0.0 s
	Time delay for taking overspeed detected fault into account.		
Fdt	**[Level fr. pulse ctrl]**		**[No]** (nO)
	Activation and adjustment of monitoring for the Pulse input (speed feedback): **[Speed fdback loss]** (SPF).		
nO -	**[No]** (nO): No monitoring of speed feedback **0.1 Hz to 599 Hz**: Adjustment of the motor frequency threshold for tripping a speed feedback detected fault (difference between the estimated frequency and the measured speed).		
F9t	**[Pulse thd. wo Run]**		**[No]** (nO)
	Activation and adjustment of brake failure monitoring: **[Brake feedback]** (brF). If brake logic control **[Brake assignment]** (bLC) page 191 is not configured, this parameter is forced to **[No]** (nO).		
nO -	**[No]** (nO): No brake monitoring **1 Hz to 1,000 Hz**: Adjustment of the motor frequency threshold for tripping a brake failure trip (detection of speeds other than 0).		
t9b	**[Pulse wo Run delay]**	0.0 s to 10.0 s	0.0 s
	Time delay for taking brake failure trip into account.		

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > FLT- > PPI-

Load variation detection

This detection is only possible with the High-speed hoisting function. It can be used to detect if an obstacle has been reached, triggering a sudden (upward) increase or (downward) decrease in the load.

Load variation detection triggers a **[Dynamic load fault]** (*dLF*). The **[Dyn. load Mgt.]** (*dL b*) parameter can be used to configure the response of the drive in the event of this detected fault.

Load variation detection can also be assigned to a relay or a logic output.

There are two possible detection modes, depending on the configuration of high-speed hoisting:
- Speed reference mode
  [High speed hoisting] (*H5 D*) page 202 is set to **[Speed ref]** (*5 5 D*).
  Torque variation detection.
  During high-speed operation, the load is compared to that measured during the speed step. The permissible load variation and its duration can be configured. If exceeded, the drive switches to fault mode.
- Current limitation mode
  [High speed hoisting] (*H5 D*) page 202 is set to **[Current Limit]** (*C5 D*).
  On ascend, during high-speed operation, an increase in load will result in a drop in speed. Even if high-speed operation has been activated, if the motor frequency drops below the **[I Limit Frequency]** (*5 C L*) threshold page 202, the drive will switch to fault mode. The detection is realised only for a positive variation of the load and only in the high speed area (area upper to **[I Limit Frequency]** (*5 C L*)).
  On descend, operation takes the form of Speed reference mode.

Code	Name / Description	Adjustment range	Factory setting
FLt-	**[FAULT MANAGEMENT]** (continued)		
dLd-	**[DYNAMIC LOAD DETECT.]**		
	Load variation detection. This can be accessed if **[High speed hoisting]** (*H5 D*) page 202 is not **[No]** (*n D*).		
tLd	**[Dynamic load time]**		**[No]** (*n D*)
	Activation of load variation detection and adjustment of time delay for taking load variation detected fault **[Dynamic load fault]** (*dLF*) into account.		
n D -	**[No]** (*n D*): No load variation detection **0.00 s to 10.00 s**: Adjustment of the time delay for taking detected fault into account.		
dLd	**[Dynamic load threshold]**	1 to 100%	100%
	Adjustment of the trip threshold for load variation detection, as a % of the load measured during the speed step.		
dL b	**[Dyn. load Mgt.]**		**[Freewheel]** (*YE5*)
	Behavior of the drive in the event of a load variation detected fault.		
n D *YE5* *Stt* *LFF* *rL5* *rПP* *F5t*	**[Ignore]** (*n D*): Detected fault ignored **[Freewheel]** (*YE5*): Freewheel stop **[Per STT]** (*5 t t*): Stop according to configuration of **[Type of stop]** (*5 t t*) page 170, without tripping. In this case, the fault relay does not open and the drive is ready to restart as soon as the detected fault disappears, according to the restart conditions of the active command channel, (for example, according to **[2/3 wire control]** (*t C C*) and **[2 wire type]** (*t C t*) page 122 if control is via the terminals). Configuring an alarm for this detected fault is recommended (assigned to a logic output, for example) in order to indicate the cause of the stop **[Fallback spd.]** (*LFF*): Change to fallback speed, maintained as long as the detected fault persists and the run command has not been removed (1) **[Spd maint.]** (*rL5*): The drive maintains the speed at the time the detected fault occurred, as long as the detected fault persists and the run command has not been removed (1) **[Ramp stop]** (*rПP*): Stop on ramp **[Fast stop]** (*F5t*): Fast stop		

Parameters described in this page can be accessed by:			DRI- > CONF > FULL > FLT- > ULD-

t n L	**[Autotune fault mgt]**		**[Freewheel]** (*YES*)
n O *YES*	**[Ignore]** (*n O*): Detected fault ignored **[Freewheel]** (*YES*): Freewheel stop		

(1) Because, in this case, the detected fault does not trigger a stop, it is recommended to assign a relay or logic output to its indication.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

⟳ Parameter that can be modified during operation or when stopped.

Parameters described in this page can be accessed by:	DRI- > CONF > FULL > FLT- > ULD-

Card pairing

Function can only be accessed in **[Expert]** (*E P r*) mode.

This function is used to detect whenever a card has been replaced or the software has been modified in any way.

When a pairing password is entered, the parameters of the card currently inserted are stored. On every subsequent power-up, these parameters are verified and, in the event of a discrepancy, the drive locks in HCF fault mode. Before the drive can be restarted, you must revert to the original situation or re-enter the pairing password.

The following parameters are verified:
- The type of card for: all cards.
- The software version for: the control block, the communication cards.
- The serial number for: the control block.

Code	Name / Description	Adjustment range	Factory setting
F L t -	**[FAULT MANAGEMENT]** (continued)		
P P I -	**[CARDS PAIRING]**		
P P I ★ *O F F* -	**[Pairing password]** The **[OFF]** (*O F F*) value signifies that the card pairing function is inactive The **[ON]** (*O n*) value signifies that card pairing is active and that an access code must be entered in order to start the drive in the event of a card pairing detected fault As soon as the code has been entered, the drive is unlocked and the code changes to **[ON]** (*O n*). The PPI code is an unlock code known only to Schneider Electric Product Support.	**[OFF]** (*O F F*) to 9,999	**[OFF]** (*O F F*)

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

Parameters described in this page can be accessed by:　　　　　　DRI- > CONF > FULL > FLT - > OLD-

Process underload detected fault

A process underload is detected when the next event occurs and remains pending for a minimum time
[Unld T. Del. Detect] (ULt), which is configurable:
- The motor is in steady state and the torque is below the set underload limit (**[Unld. Thr. 0. Speed.]** (LUL),
  [Unld. Thr. Nom. Speed.] (LUn), **[Unld. Freq. Thr. Det.]** (rNUd) parameters).
- The motor is in steady state when the offset between the frequency reference and motor frequency falls
  below the configurable threshold **[Hysteresis Freq. Att.]** (Srb).

Torque as a % of
the rated torque
Between zero frequency and the rated frequency,
the curve reflects the following equation:

$$\text{torque} = LUL + \frac{(LUn - LUL) \times (\text{frequency})^2}{(\text{rated frequency})^2}$$

The underload function is not active for
frequencies below
[Unld. Freq. Thr. Det.] (rNUd).

A relay or a logic output can be assigned to the signaling of this detected fault in the
[INPUTS / OUTPUTS CFG] (I_O-) menu.

Code	Name / Description	Adjustment range	Factory setting
FLt -	**[FAULT MANAGEMENT]** (continued)		
ULd -	**[PROCESS UNDERLOAD]**		
ULt	**[Unld T. Del. Detect.]**	0 to 100 s	0 s
	Underload detection time delay. A value of 0 deactivates the function and makes the other parameters inaccessible.		
LUn ★ ↻	**[Unld. Thr. Nom. Speed.]** Underload threshold at rated motor frequency (**[Rated motor freq.]** (Fr5) page 84), as a % of the rated motor torque.	20 to 100%	60%
LUL ★ ↻	**[Unld. Thr. 0. Speed.]** Underload threshold at zero frequency, as a % of the rated motor torque.	0 to **[Unld.Thr.Nom.Speed]** (LUn)	0%
rNUd ★ ↻	**[Unld. Freq. Thr. Det.]** Minimum frequency underload detection threshold.	0 to 599 Hz	0 Hz
Srb ★ ↻	**[Hysteresis Freq. Att.]** Maximum deviation between the frequency reference and the motor frequency, which defines steady state operation.	0.3 to 599 Hz	0.3 Hz

Parameters described in this page can be accessed by:

Code	Name / Description	Adjustment range	Factory setting
_U d L_	**[Underload Managmt.]**		**[Freewheel]** (_Y E S_)
★	Behavior on switching to underload detection.		
_n O_	**[Ignore]** (_n O_): Detected fault ignored		
_Y E S_	**[Freewheel]** (_Y E S_): Freewheel stop		
_r N P_	**[Ramp stop]** (_r N P_): Stop on ramp		
_F S t_	**[Fast stop]** (_F S t_): Fast stop		
_F t U_	**[Underload T.B. Rest.]**	0 to 6 min	0 min
★ ◯	This parameter cannot be accessed if **[Underload Mangmt.]** (_U d L_) is set to **[Ignore]** (_n O_). Minimum time permitted between an underload being detected and any automatic restart. In order to allow an automatic restart, the value of **[Max. restart time]** (_t A r_) page 249 must exceed this parameter by at least one minute.		

★	These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

◯	Parameter that can be modified during operation or when stopped.

Process overload detected fault

A process overload is detected when the next event occurs and remains pending for a minimum time **[Ovld Time Detect.]** (*t O L*), which is configurable:

- The drive is in current limitation mode.

- The motor is in steady state and the current is above the set overload threshold **[Ovld Detection Thr.]** (*L O C*).

The motor is in steady state when the offset between the frequency reference and motor frequency falls below the configurable threshold **[Hysteresis Freq. Att.]** (*S r b*).

A relay or a logic output can be assigned to the signaling of this detected fault in the

[INPUTS / OUTPUTS CFG] (*I _ O*-) menu.

Code	Name / Description	Adjustment range	Factory setting
FLt -	**[FAULT MANAGEMENT]** (continued)		
OLd -	**[PROCESS OVERLOAD]**		
t O L	**[Ovld Time Detect.]**	0 to 100 s	0 s
	Overload detection time delay. A value of 0 deactivates the function and makes the other parameters inaccessible.		
L O C ★ () (1)	**[Ovld Detection Thr.]**	70 to 150%	110%
	Overload detection threshold, as a % of the rated motor current **[Rated mot. current]** (*n C r*) page 84. This value must be less than the limit current in order for the function to work.		
S r b ★ () (1)	**[Hysteresis Freq.Att.]**	0 to 599 Hz	0.3 Hz
	Maximum deviation between the frequency reference and the motor frequency, which defines steady state operation.		
O d L ★	**[Ovld.Proces.Mngmt]**		**[Freewheel]** (*Y E S*)
	Behavior on switching to overload detection.		
n O *Y E S* *r M P* *F S t*	**[Ignore]** (*n O*): Detected fault ignored **[Freewheel]** (*Y E S*): Freewheel stop **[Ramp stop]** (*r M P*): Stop on ramp **[Fast stop]** (*F S t*): Fast stop		
F t O ★ () (1)	**[Overload T.B.Rest.]**	0 to 6 min	0 min
	This parameter cannot be accessed if **[Ovld.Proces.Mngmt]** (*O d L*) is set to **[Ignore]** (*n O*). Minimum time permitted between an overload being detected and any automatic restart. In order to allow an automatic restart, the value of **[Max. restart time]** (*t A r*) page 249 must exceed this parameter by at least one minute.		
FLt -	**[FAULT MANAGEMENT]** (continued)		
LFF -	**[FALLBACK SPEED]**		
L F F	**[Fallback speed]**	0 to 599 Hz	0 Hz
	Selection of the fallback speed.		

Code	Name / Description	Adjustment range	Factory setting

COd-

+ –
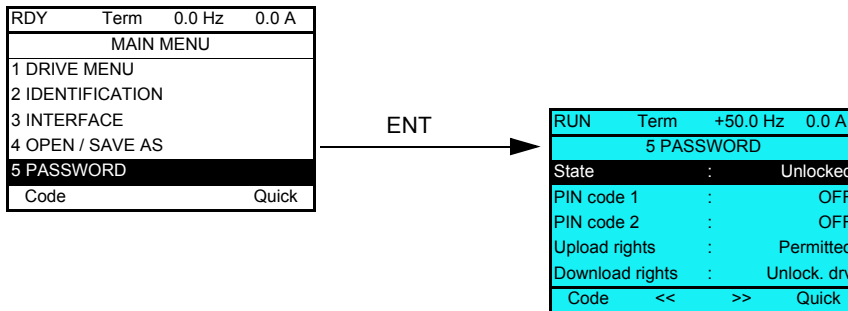

ENT → PASSWORD
ESC

Enables the configuration to be protected with an access code or a password to be entered in order to access a protected configuration.

Example with graphic display terminal:

RUN	Term	+50.0 Hz	0.0 A
	5 PASSWORD		
State	:		Unlocked
PIN code 1	:		OFF
Upload rights	:		Permitted
Download rights	:		Unlock. drv
Code	<<	>>	Quick

ENT →

RUN	Term	+50.0 Hz	0.0 A
	PIN 1ode 1		
	9 5 2 **0**		
Min =OFF			Max =9999
	<<	>>	Quick
- The drive is unlocked when the PIN codes are set to **[Unlocked]** (*OFF*) (no password) or when the correct code has been entered. All menus are visible.
- Before protecting the configuration with an access code, you must:
  - Define the **[Upload rights]** (*ULr*) and **[Download rights]** (*dLr*).
  - Make a careful note of the code and keep it in a place where you will be able to find it.

- The drive has 2 access codes, enabling 2 access levels to be set up:
    - PIN code 1 is a public unlock code: 6969.
    - PIN code 2 is an unlock code known only to Schneider Electric Product Support. It can only be
        accessed in **[Expert]** (*E P r*) mode.
    - Only one PIN1 or PIN2 code can be used, the other must remain set to **[OFF]** (*O F F*).

Note: When the unlock code is entered, the user access code appears.

The following items are access-protected:
- Return to factory settings (**[FACTORY SETTINGS]** (*F C S -*) menu.
- The channels and parameters protected by the **[MY MENU]** (*M Y M n -*) as well as the menu itself.
- The custom display settings (**[3.4 DISPLAY CONFIG.]** (*d C F -*) menu).

Code	Name / Description	Adjustment range	Factory setting
C O d -	**[5 PASSWORD]**		
C S t	**[State]**		**[Unlocked]** (*U L C*)
	Information parameter, cannot be modified.		
L C	**[Locked]** (*L C*): The drive is locked by a password		
U L C	**[Unlocked]** (*U L C*): The drive is not locked by a password		
C O d	**[PIN code 1]**	**[OFF]** (*O F F*) to 9,999	**[OFF]** (*O F F*)
	1st access code. The value **[OFF]** (*O F F*) indicates that no password has been set **[Unlocked]** (*U L C*). The value **[ON]** (*O n*) indicates that the drive is protected and an access code must be entered in order to unlock it. Once the correct code has been entered, it remains on the display and the drive is unlocked until the next time the power supply is disconnected. PIN code 1 is a public unlock code: 6969.		
C O d 2	**[PIN code 2]**	**[OFF]** (*O F F*) to 9,999	**[OFF]** (*O F F*)
	This parameter can only be accessed in **[Expert]** (*E P r*) mode. 2nd access code. The value **[OFF]** (*O F F*) indicates that no password has been set **[Unlocked]** (*U L C*). The value **[ON]** (*O n*) indicates that the drive is protected and an access code must be entered in order to unlock it. Once the correct code has been entered, it remains on the display and the drive is unlocked until the next time the power supply is disconnected. PIN code 2 is an unlock code known only to Schneider Electric Product Support. When **[PIN code 2]** (*C O d 2*) is not set to **[OFF]** (*O F F*), the **[1.2 MONITORING]** (*M O n -*) menu is the only one visible. Then if **[PIN code 2]** (*C O d 2*) is set to **[OFF]** (*O F F*) (drive unlocked), all menus are visible. If the display settings are modified in **[3.4 DISPLAY CONFIG.]** (*d C F -*) menu, and if **[PIN code 2]** (*C O d 2*) is not set to **[OFF]** (*O F F*), the visibility configured is kept. Then if **[PIN code 2]** (*C O d 2*) is set to OFF (drive unlocked), the visibility configured in **[3.4 DISPLAY CONFIG.]** (*d C F -*) menu is kept.		
U L r	**[Upload rights]**		**[Permitted]** (*U L r O*)
	Reads or copies the current configuration to the drive.		
U L r O	**[Permitted]** (*U L r O*): The current drive configuration can be uploaded to the graphic display terminal or PC Software.		
U L r 1	**[Not allowed]** (*U L r 1*): The current drive configuration can only be uploaded to the graphic display terminal or PC Sofware if the drive is not protected by an access code or if the correct code has been entered.		
d L r	**[Download rights]**		**[Unlock. drv]** (*d L r 1*)
	Writes the current configuration to the drive or downloads a configuration to the drive.		
d L r O	**[Locked drv]** (*d L r O*): A configuration file can only be downloaded to the drive if the drive is protected by an access code, which is the same as the access code for the configuration to be downloaded.		
d L r 1	**[Unlock. drv]** (*d L r 1*): A configuration file can be downloaded to the drive or a configuration in the drive can be modified if the drive is unlocked (access code entered) or is not protected by an access code.		
d L r 2	**[Not allowed]** (*d L r 2*): Download not authorized.		
d L r 3	**[Lock/unlock]** (*d L r 3*): Combination of **[Locked drv.]** (*d L r O*) and **[Unlock. drv]** (*d L r 1*).		

Multipoint Screen

10

Multipoint Screen

Communication is possible between a graphic display terminal and a number of drives connected on the same bus. The addresses of the drives must be configured in advance in the **[COMMUNICATION]** (*C O M -*) menu using the **[Modbus Address]** (*A d d*) parameter, page 273.

When a number of drives are connected to the same graphic display terminal, it automatically displays the following screens:
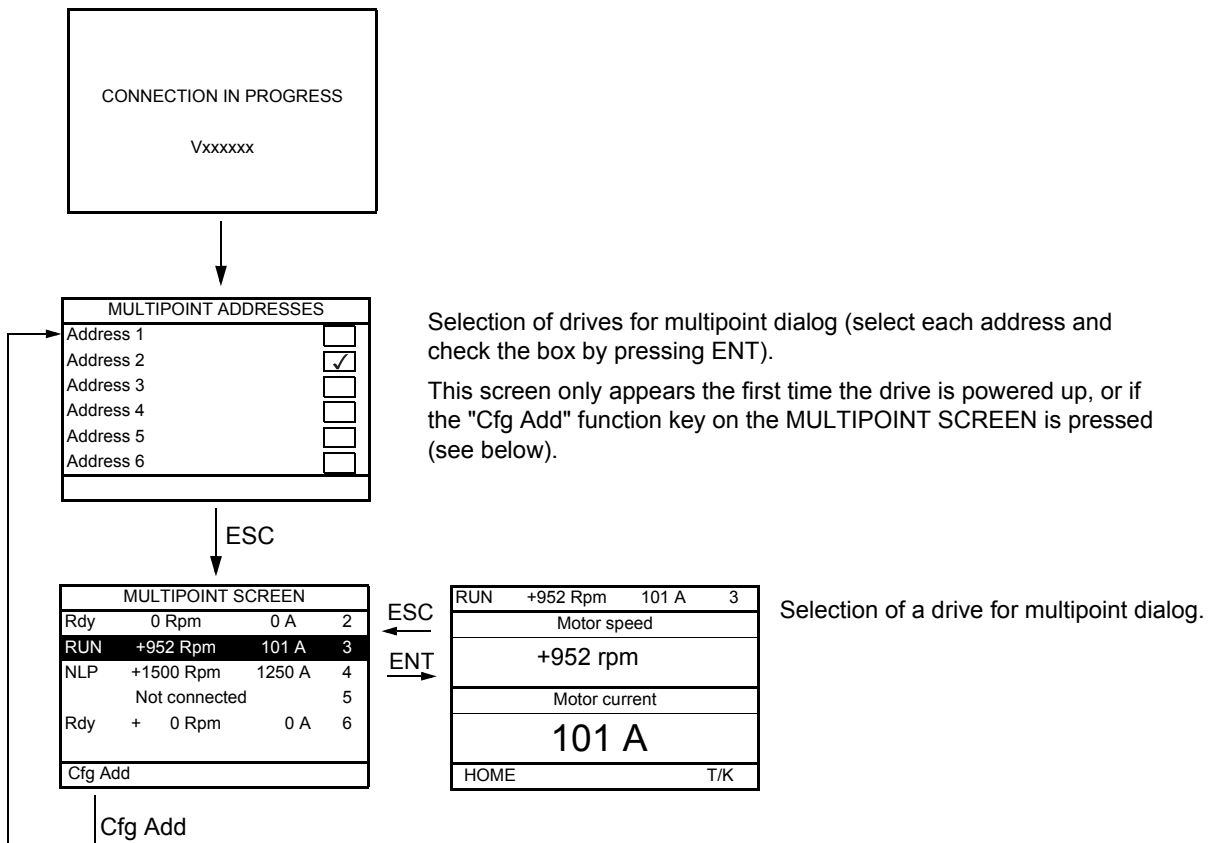

```
┌─────────────────────────┐
│                         │
│                         │
│ CONNECTION IN PROGRESS  │

Selection of a drive for multipoint dialog.

Cfg Add

In multipoint mode, the command channel is not displayed. From left to right, the state, then the 2 selected parameters, and finally the drive address appear.

All menus can be accessed in multipoint mode. Only drive control via the graphic display terminal is not authorized, apart from the Stop key, which locks all the drives.

If there is a trip on a drive, this drive is displayed.

Maintenance and Diagnostics

III

What's in this Part?

This part contains the following chapters:

Maintenance

11

Limitation of Warranty

The warranty does not apply if the product has been opened, except by Schneider Electric services.

Servicing

CAUTION
RISK OF DAMAGE TO THE DRIVE
Adapt the following recommendations according to the environment conditions: temperature, chemical, dust.
Failure to follow these instructions can result in equipment damage.

It is recommended to do the following in order to optimize continuity of operation.

Environment	Part concerned	Action	Periodicity
Knock on the product	Housing - control block (led - display)	Check the drive visual aspect	At least each year
Corrosion	Terminals - connector - screws - EMC plate	Inspect and clean if required	
Dust	Terminals - fans - blowholes		
Temperature	Around the product	Check and correct if required	
Cooling	Fan	Check the fan operation	
		Replace the fan	After 3 to 5 years, depending on the operating conditions
Vibration	Terminal connections	Check tightening at recommended torque	At least each year

Note: The fan operation depends on the drive thermal state. The drive may be running and the fan not.

Spares and repairs

Serviceable product. Please refer to your Customer Care Centre.

Long time storage

The product capacitor performances after a long time storage above 2 years can be degraded. See page 10.

Fan replacement

It is possible to order a new fan for the ATV32 maintenance, see the commercial references on www.schneider-electric.com.

Please refer to Installation manual to replace the fan.

Diagnostics and Troubleshooting

12

What's in this Chapter?

This chapter contains the following topics:

⚡ ⚠ **DANGER**
HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH
Read and understand the precautions in "About the book" chapter, before performing any procedure in this section.
Failure to follow these instructions will result in death or serious injury.

Error code

- If the display does not light up, check the power supply to the drive.
- The assignment of the Fast stop or Freewheel functions will help to prevent the drive starting if the corresponding logic inputs are not powered up. The ATV32 then displays **[Freewheel]** ($n 5 t$) in freewheel stop and **[Fast stop]** ($F 5 t$) in fast stop. This is normal since these functions are active at zero so that the drive will be stopped if there is a wire break.
- Check that the run command input is activated in accordance with the selected control mode (**[2/3 wire control]** ($t C C$) and **[2 wire type]** ($t C t$) parameters, page 83).
- If an input is assigned to the limit switch function and this input is at zero, the drive can only be started up by sending a command for the opposite direction (see page 221).
- If the reference channel or command channel is assigned to a communication bus, when the power supply is connected, the drive will display **[Freewheel]** ($n 5 t$) and remain in stop mode until the communication bus sends a command.

Code	Name / Description
$d G t$ -	**[DIAGNOSTICS]** This menu can only be accessed with the graphic display terminal. It displays detected faults and their cause in plain text and can be used to carry out tests, see page 62.

Clearing the detected fault

In the event of a non resettable detected fault:

- Disconnect all power, including external control power that may be present.
- Lock all power disconnects in the open position.
- Wait 15 minutes to allow the DC bus capacitors to discharge (the drive LEDs are not indicators of the absence of DC bus voltage).
- Measure the voltage of the DC bus between the PA/+ and PC/– terminals to ensure that the voltage is less than 42 Vdc.
- If the DC bus capacitors do not discharge completely, contact your local Schneider Electric representative. Do not repair or operate the drive.
- Find and correct the detected fault.
- Restore power to the drive to confirm the detected fault has been rectified.

In the event of a resettable detected fault, the drive can be reset after the cause is cleared:

- By switching off the drive until the display disappears completely, then switching on again.
- Automatically in the scenarios described for the **[AUTOMATIC RESTART]** ($A t r$ -) function, page 249.
- By means of a logic input or control bit assigned to the **[FAULT RESET]** ($r 5 t$ -) function, page 247.
- By pressing the STOP/RESET key on the graphic display keypad if the active channel command is the HMI (see **[Cmd channel 1]** ($C d 1$) page 152).

Fault detection codes which require a power reset after the detected fault is cleared

The cause of the detected fault must be removed before resetting by turning off and then back on.

ASF, brF, SOF, SPF and tnF detected faults can also be cleared remotely by means of a logic input or control bit ([Fault reset] (rSF) parameter, page 247).

Detected Fault	Name	Probable cause	Remedy
AnF	[Load slipping]	• The difference between the output frequency and the speed feedback is not correct.	• Check the motor, gain and stabillity parameters. • Add a braking resistor. • Check the size of the motor/drive/load. • Check the encoder's mechanical coupling and its wiring. • Check the setting of parameters
ASF	[Angle Error]	• This occurs during the phase-shift angle measurement, if the motor phase is disconnected or if the motor inductance is too high.	• Check the motor phases and the maximum current allowed by the drive.
brF	[Brake feedback]	• The brake feedback contact does not match the brake logic control. • The brake does not stop the motor quickly enough (detected by measuring the speed on the "Pulse input" input).	• Check the feedback circuit and the brake logic control circuit. • Check the mechanical state of the brake. • Check the brake linings.
CrF1	[Precharge]	• Charging relay control detected fault or charging resistor damaged.	• Turn the drive off and then turn on again. • Check the internal connections. • Contact Schneider Electric Product Support.
EEF1	[Control Eeprom]	• Internal memory detected fault, control block.	• Check the environment (electromagnetic compatibility). • Turn off, reset, return to factory settings. • Contact Schneider Electric Product Support.
EEF2	[Power Eeprom]	• Internal memory detected fault, power card.	
FCF1	[Out. contact. stuck]	• The output contactor remains closed although the opening conditions have been met.	• Check the contactor and its wiring. • Check the feedback circuit.
HdF	[IGBT desaturation]	• Short-circuit or grounding at the drive output.	• Check the cables connecting the drive to the motor, and the motor insulation.
ILF	[internal com. link]	• Communication interruption between option card and drive.	• Check the environment (electromagnetic compatibility). • Check the connections. • Replace the option card. • Contact Schneider Electric Product Support.
InF1	[Rating error]	• The power card is different from the card stored.	• Check the reference of the power card.
InF2	[Incompatible PB]	• The power card is incompatible with the control block.	• Check the reference of the power card and its compatibility.
InF3	[Internal serial link]	• Communication interruption between the internal cards.	• Check the internal connections. • Contact Schneider Electric Product Support.
InF4	[Internal-mftg zone]	• Internal data inconsistent.	• Recalibrate the drive (performed by Schneider Electric Product Support).
InF6	[Internal - fault option]	• The option installed in the drive is not recognized.	• Check the reference and compatibility of the option. • Check that the option is well inserted into the ATV32.
InF9	[Internal- I measure]	• The current measurements are incorrect.	• Replace the current sensors or the power card. • Contact Schneider Electric Product Support.
InFA	[Internal-mains circuit]	• The input stage is not operating correctly.	• Contact Schneider Electric Product Support.
InFb	[Internal- th. sensor]	• The drive temperature sensor is not operating correctly.	• Replace the drive temperature sensor. • Contact Schneider Electric Product Support.
InFE	[internal- CPU]	• Internal microprocessor detected fault.	• Turn off and reset. • Contact Schneider Electric Product Support.
SAFF	[Safety fault]	• Debounce time exceeded. • SS1 trip threshold exceeded. • Wrong configuration. • SLS type trip overspeed detected.	• Check the safety functions configuration. • Check the ATV32 Integrated safety Functions Manual (S1A45606) • Contact Schneider Electric Product Support.

Detected Fault	Name	Probable cause	Remedy
SOF	**[Overspeed]**	• Instability or driving load too high.	• Check the motor, gain and stability parameters. • Add a braking resistor. • Check the size of the motor/drive/load. • Check the parameters settings for the **[FREQUENCY METER]** (_FqF -_) function page 263, if it is configured.
SPF	**[Speed fdback loss]**	• Signal on "Pulse input" missing, if the input is used for speed measurement. • Encoder feedback signal missing	• Check the wiring of the input cable and the detector used. • Check the configuration parameters of the encoder. • Check the wiring between the encoder and the drive. • Check the encoder.

SOF	**[Overspeed]**	• Instability or driving load too high.	

Fault detection codes that can be cleared with the automatic restart function after the cause has disappeared

These detected faults can also be cleared by turning on and off or by means of a logic input or control bit ([Fault reset] (⌐ 5 F) parameter page 247).

Detected Fault	Name	Probable cause	Remedy
b L F	[Brake control]	• Brake release current not reached. • Brake engage frequency threshold [Brake engage freq] (b E n) only regulated when brake logic control is assigned.	• Check the drive/motor connection. • Check the motor windings. • Check the [Brake release I FW] (I b ⌐) and [Brake release I Rev] (I ⌐ d) settings page 191. • Apply the recommended settings for [Brake engage freq] (b E n).
C n F	[Com. network]	• Communication interruption on communication card.	• Check the environment (electromagnetic compatibility). • Check the wiring. • Check the time-out. • Replace the option card. • Contact Schneider Electric Product Support.
C O F	[CANopen com.]	• Communication interruption on the CANopen® bus.	• Check the communication bus. • Check the time-out. • Refer to the CANopen® User's manual.
E P F 1	[External flt-LI/Bit]	• Event triggered by an external device, depending on user.	• Check the device which caused the trip and reset.
E P F 2	[External fault com.]	• Event triggered by a communication network.	• Check for the cause of the trip and reset.
F b E S	[FB stop flt.]	• Function blocks have been stopped while motor was running.	• Check [Stop FB Stop motor] (F b 5 N) configuration.
F C F 2	[Out. contact. open.]	• The output contactor remains open although the closing conditions have been met.	• Check the contactor and its wiring. • Check the feedback circuit.
L C F	[input contactor]	• The drive is not turned on even though [Mains V. time out] (L C E) has elapsed.	• Check the contactor and its wiring. • Check the time-out. • Check the line/contactor/drive connection.
L F F 3	[AI3 4-20mA loss]	• Loss of the 4-20 mA reference on analog input AI3.	• Check the connection on the analog inputs.
O b F	[Overbraking]	• Braking too sudden or driving load. • Line voltage too high.	• Increase the deceleration time. • Install a braking resistor if necessary. • Activate the [Dec ramp adapt.] (b ⌐ A) function page 169, if it is compatible with the application. • Check the line voltage.
O C F	[Overcurrent]	• Parameters in the [SETTINGS] (5 E E -) and [MOTOR CONTROL] (d ⌐ C -) menus are not correct. • Inertia or load too high. • Mechanical locking.	• Check the parameters. • Check the size of the motor/drive/load. • Check the state of the mechanism. • Decrease [Current limitation] (C L 1). • Increase the switching frequency.
O H F	[Drive overheat]	• Drive temperature too high.	• Check the motor load, the drive ventilation and the ambient temperature. Wait for the drive to cool down before restarting.
O L C	[Proc. overload flt]	• Process overload.	• Check and remove the cause of the overload. • Check the parameters of the [PROCESS OVERLOAD] (O L d -) function, page 269.
O L F	[Motor overload]	• Triggered by excessive motor current.	• Check the setting of the motor thermal protection, check the motor load. Wait for the motor to cool down before restarting.
O P F 1	[1 output phase loss]	• Loss of one phase at drive output.	• Check the connections from the drive to the motor.

Detected Fault	Name	Probable cause	Remedy
OPF2	[3 motor phase loss]	• Motor not connected or motor power too low. • Output contactor open. • Instantaneous instability in the motor current.	• Check the connections from the drive to the motor. • If an output contactor is being used, set [Output Phase Loss] (OPL) to [Output cut] (OAC), page 253. • Test on a low power motor or without a motor: In factory settings mode, motor phase loss detection is active [Output Phase Loss] (OPL) = [Yes] (YES). To check the drive in a test or maintenance environment, without having to use a motor with the same rating as the drive (in particular for high power drives), deactivate motor phase loss detection [Output Phase Loss] (OPL) = [No] (nO), see instructions given page 253. • Check and optimize the following parameters: [IR compensation] (UFr) page 88, [Rated motor volt.] (UnS) and [Rated mot. current] (nCr) page 84 and perform [Auto tuning] (tUn) page 85.
OSF	[Mains overvoltage]	• Line voltage too high. • Disturbed mains supply.	• Check the line voltage.
OtFL	[LI6=PTC overheat]	• Overheating of PTC probes detected on input LI6.	• Check the motor load and motor size. • Check the motor ventilation. • Wait for the motor to cool before restarting. • Check the type and state of the PTC probes.
PtFL	[LI6=PTC probe]	• PTC probe on input LI6 open or short-circuited.	• Check the PTC probe and the wiring between it and the motor/drive.
SCF1	[Motor short circuit]	• Short-circuit or grounding at the drive output.	• Check the cables connecting the drive to the motor, and the motor insulation. • Reduce the switching frequency. • Connect chokes in series with the motor. • Check the adjustment of speed loop and brake. • Increase the [Time to restart] (ttr), page 98. • Increase the switching frequency.
SCF3	[Ground short circuit]	• Significant earth leakage current at the drive output if several motors are connected in parallel.	• Check the cables connecting the drive to the motor, and the motor insulation. • Reduce the switching frequency. • Connect chokes in series with the motor. • Check the adjustment of speed loop and brake. • Increase the [Time to restart] (ttr), page 98. • Reduce the switching frequency.
SCF4	[IGBT short circuit]	• Power component detected fault.	• Contact Schneider Electric Product Support.
SCF5	[Motor short circuit]	• Short-circuit at drive output.	• Check the cables connecting the drive to the motor, and the motor's insulation. • Contact Schneider Electric Product Support.
SLF1	[Modbus com.]	• Communication interruption on the Modbus bus.	• Check the communication bus. • Check the time-out. • Refer to the Modbus User's manual.
SLF2	[PC com.]	• Communication interruption with PC Software.	• Check the PC Software connecting cable. • Check the time-out.
SLF3	[HMI com.]	• Communication interruption with the graphic display terminal or remote display terminal.	• Check the terminal connection • Check the time-out.
SSF	[Torque/current lim]	• Switch to torque or current limitation.	• Check if there are any mechanical problems. • Check the parameters of [TORQUE LIMITATION] (tOL-) page 213 and the parameters of the [TORQUE OR I LIM. DETECT.] (tId-), page 261.
tJF	[IGBT overheat]	• Drive overheated.	• Check the size of the load/motor/drive. • Reduce the switching frequency. • Wait for the motor to cool before restarting.

Detected Fault	Name	Probable cause	Remedy
ᵗ ⁿ F	**[Auto-tuning]**	• Special motor or motor whose power is not suitable for the drive. • Motor not connected to the drive. • Motor not stopped	• Check that the motor/drive are compatible. • Check that the motor is present during auto-tuning. • If an output contactor is being used, close it during auto-tuning. • Check that the motor is stopped during tune operation.
U L F	**[Proc. underload Flt]**	• Process underload.	• Check and remove the cause of the underload. • Check the parameters of the **[PROCESS UNDERLOAD]** (*U l d -*) function, page 267.

Fault detection codes that are cleared as soon as their cause disappears

Detected Fault	Name	Probable cause	Remedy
CFF	[Incorrect config.]	• Option card changed or removed.	• Check that there are no card errors. • In the event of the option card being changed/removed deliberately, see the remarks below.
		• Control block replaced by a control block configured on a drive with a different rating.	• Check that there are no card errors. • In the event of the control block being changed deliberately, see the remarks below.
		• The current configuration is inconsistent.	• Return to factory settings or retrieve the backup configuration, if it is valid (see page 79).
CF1 *CF12*	[Invalid config.]	• Invalid configuration. The configuration loaded in the drive via the bus or communication network is inconsistent.	• Check the configuration loaded previously. • Load a compatible configuration.
CSF	[Ch. Sw. fault]	• Switch to not valid channels.	• Check the function parameters.
dLF	[Dynamic load fault]	• Abnormal load variation.	• Check that the load is not blocked by an obstacle. • Removal of a run command causes a reset.
FbE	[FB fault]	• Function blocks error.	• See [FB Fault] (*FbFt*) for more details.
HCF	[Cards pairing]	• The [CARDS PAIRING] (*PPI-*) function page 266 has been configured and a drive card has been changed.	• In the event of a card error, reinsert the original card. • Confirm the configuration by entering the [Pairing password] (*PPI*) if the card was changed deliberately.
PHF	[Input phase loss]	• Drive incorrectly supplied or a fuse blown. • One phase missing. • 3-phase ATV32 used on a single-phase line supply. • Unbalanced load. This protection only operates with the drive on load.	• Check the power connection and the fuses. • Use a 3-phase line supply. • Disable the detected fault by [Input phase loss] (*IPL*) = [No] (*nO*) page 84.
USF	[Undervoltage]	• Line supply too low. • Transient voltage dip.	• Check the voltage and the parameters of [UNDERVOLTAGE MGT] (*USb-*), page 256.

Option card changed or removed

When an option card is removed or replaced by another, the drive locks in [Incorrect config.] (*CFF*) fault mode on power-up. If the card has been deliberately changed or removed, the detected fault can be cleared by pressing the ENT key twice, which causes the factory settings to be restored (see page 79) for the parameter groups affected by the card. These are as follows:

Card replaced by a card of the same type
• Communication cards: only the parameters that are specific to communication cards

Control block changed

When a control block is replaced by a control block configured on a drive with a different rating, the drive locks in [Incorrect config.] (*CFF*) fault mode on power-up. If the control block has been deliberately changed, the detected fault can be cleared by pressing the ENT key twice, which **causes all the factory settings to be restored.**

Fault detection codes displayed on the remote display terminal

Code	Name	Description
In It	**[Initialization in progress]**	The microcontroller is initializing. Search underway for communication configuration.
COM. E (1)	**[Communication error]**	Time out detected fault (50 ms). This message is displayed after 20 attempts at communication.
A - 17 (1)	**[Alarm button]**	A key has been held down for more than 10 seconds. The keypad is disconnected. The keypad wakes up when a key is pressed.
CLr (1)	**[Confirmation of detected fault reset]**	This is displayed when the STOP key is pressed once if the active command channel is the remote display terminal.
dEU. E (1)	**[Drive disparity]**	The drive brand does not match that of the remote display terminal.
rOM. E (1)	**[ROM anomaly]**	The remote display terminal detects a ROM anomaly on the basis of checksum calculation.
rAM. E (1)	**[RAM anomaly]**	The remote display terminal detects a RAM anomaly.
CPU. E (1)	**[Other detected faults]**	Other detected faults.

(1) Flashing
