Warning concept

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

| |
|--|
|  DANGER |
| indicates that death or serious injury will result if proper precautions are not taken. |
|  WARNING |
| indicates that death or serious injury could result if proper precautions are not taken. |
|  CAUTION |
| indicates that minor personal injury can result if proper precautions are not taken. |
| NOTICE |
| indicates that property damage can result if proper precautions are not taken. |

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

| |
|--|
|  WARNING |
| Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Information in the associated documentation must be observed. |

Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of liability

We have verified that the contents of this document correspond to the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

Preface

SINAMICS documentation

The SINAMICS documentation is organized in the following categories:

- General documentation/catalogs
- Manufacturer/service documentation

Additional information

Target group

This documentation is intended for machine manufacturers, commissioning engineers, and service personnel who use the SINAMICS drive system.

Benefits

This documentation contains comprehensive information about parameters, function diagrams and faults and alarms required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.

Standard scope

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied.

- Other functions not described in this documentation might be able to be executed in the drive system. This does not, however, represent an obligation to supply such functions with a new controller or when servicing.
- The documentation can also contain descriptions of functions that are not available in a particular product version of the drive system. The functionalities of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information about all of the product types. This documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

Technical Support

Country-specific telephone numbers for technical support are provided at the following Internet address:

<http://www.siemens.com/automation/service&support>

EC Declaration of Conformity

The EC Declaration of Conformity for the EMC Directive can be found on the Internet at:

<https://support.industry.siemens.com/cs/products?dtp=Certificate&mf=ps&pnid=13220&lc=d e-WW>

Alternatively, you can contact the Siemens office in your region in order to obtain the EC Declaration of Conformity.

Compliance with the General Data Protection Regulation

Siemens respects the principles of data protection, in particular the data minimization rules (privacy by design).

For this product, this means:

The product does not process neither store any person-related data, only technical function data (e.g. time stamps). If the user links these data with other data (e.g. shift plans) or if he stores person-related data on the same data medium (e.g. hard disk), thus personalizing these data, he has to ensure compliance with the applicable data protection stipulations.

1.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

1.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit:

Industrial security (<https://www.siemens.com/industrialsecurity>)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security

WARNING

Unsafe operating states resulting from software manipulation

Software manipulations (e.g. viruses, trojans, malware or worms) can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.

2.1 Overview of parameters

2.1.1 Explanation of the parameter list

Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters (Page 29)" has the following layout:

----- **Start of example** -----

| pxxxx[0...n] | BICO: Full parameter name / abbreviated name | | | |

----- **End of example** -----

The individual pieces of information are described in detail below.

pxxxx[0...n] Parameter number

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit field (optional).

Examples of the representation in the parameter list:

- p... Adjustable parameters (read and write)
- r... Display parameters (read only)
- p0918 Adjustable parameter 918
- p2051[0...13] Adjustable parameter 2051, indices 0 to 13
- p1001[0...n] Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944 Display parameter 944
- r2129.0...15 Display parameter 2129 with bit field from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of notation in the documentation:

- p1070[1] Adjustable parameter 1070, index 1
- p2098[1].3 Adjustable parameter 2098, index 1 bit 3
- p0795.4 Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Setting the PROFIBUS telegram (BICO interconnection)
p0922
- Setting component lists
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning
p0340, p3900
- Restoring the factory settings
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

Note:

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

BICO: Full parameter name/Abbreviated name

The following abbreviations can appear in front of the BICO parameter name:

- **BI:** Binector Input
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

Note:

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

CU/PM variants

Indicates for which Control Units (CU) and/or Power Modules (PM) the parameter is valid. If no CU or PM is listed, then the parameter is valid for all variants.

The following information relating to "CU" and "PM" can be displayed under the parameter number:

Table 2-1 Information in the "CU/PM variants" field

| CU/PM variants | Meaning |
|----------------|--|
| | All Control Units have this parameter. |
| CU240D-2_DP | CU240D-2 with PROFIBUS interface |
| CU240D-2_DP_F | CU240D-2 with PROFIBUS interface and PROFIsafe |
| CU240D-2_PN | CU240D-2 with PROFINET interface |
| CU240D-2_PN_F | CU240D-2 with PROFINET interface and PROFIsafe |
| CU250D-2_DP | CU250D-2 with PROFIBUS interface |
| CU250D-2_DP_F | CU250D-2 with PROFIBUS interface and PROFIsafe |
| CU250D-2_PN | CU250D-2 with PROFINET interface |
| CU250D-2_PN_F | CU250D-2 with PROFINET interface and PROFIsafe |

Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard (not adjustable, included in p0003 = 3)
- 2: Extended (not adjustable, included in p0003 = 3)
- 3: Expert
- 4: Service

Parameters with this access level are password protected.

Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 determines which calculations are to be performed:

- p0340 = 1 includes the calculations from p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 includes the calculations from p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

Note:

For p3900 > 0, p0340 = 1 is also called automatically.

After p1900 = 1, 2, p0340 = 3 is also called automatically.

Parameters with a reference to p0340 after "Calculated" depend on the Power Module being used and the motor. In this case, the values at "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

Data type

The information on the data type can consist of the following two items (separated by a slash):

- First item
Data type of the parameter
- Second item (for binector or connector input only)
Data type of the signal source to be interconnected (binector-/connector output).

Parameters can have the following data types:

- Integer8 I8 8-bit integer number
- Integer16 I16 16-bit integer number
- Integer32 I32 32-bit integer number
- Unsigned8 U8 8 bits without sign
- Unsigned16 U16 16 bits without sign
- Unsigned32 U32 32 bits without sign
- FloatingPoint32 Float 32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO-output parameter (signal source), the following combinations are possible when creating BICO-interconnections:

Table 2-2 Possible combinations of BICO interconnections

| BICO output parameter | BICO input parameter | | | |
|--|------------------------|------------------------|------------------------------|---------------------|
| | CI parameter | | | BI parameter |
| | Unsigned32 / Integer16 | Unsigned32 / Integer32 | Unsigned32 / FloatingPoint32 | Unsigned32 / Binary |
| CO: Unsigned8 | x | x | – | – |
| CO: Unsigned16 | x | x | – | – |
| CO: Unsigned32 | x | x | – | – |
| CO: Integer16 | x | x | r2050 | – |
| CO: Integer32 | x | x | r2060 | – |
| CO: FloatingPoint32 | x | x | x | – |
| BO: Unsigned8 | – | – | – | x |
| BO: Unsigned16 | – | – | – | x |
| BO: Unsigned32 | – | – | – | x |
| BO: Integer16 | – | – | – | x |
| BO: Integer32 | – | – | – | x |
| BO: FloatingPoint32 | – | – | – | – |
| Legend: x: x: BICO interconnection permitted –: –: BICO interconnection not permitted rxxxx: BICO interconnection is only permitted for the specified CO parameters | | | | |

Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. One or more states are possible.

The following states are available:

- C(x) Commissioning C: Commissioning
 Drive commissioning is in progress (p0010 > 0).
 Pulses cannot be enabled.
 The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
 - C: Can be changed for all settings p0010 > 0.
 - C(x): Can only be changed for the settings p0010 = x.
 A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U Operation U: Run
 Pulses are enabled.
- T Ready T: Ready to run
 The pulses are not enabled and the status "C(x)" is not active.

Normalization

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 % (word) or 4000 0000 hex = 100 % (double word)
- p0514: specific normalization

Refer to the description for p0514[0...9] and p0515[0...19] to p0524[0...19]

Dyn. index (dynamic index)

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)

Data sets can only be created and deleted when p0010 = 15.

Note:

Information on the data sets can be taken from the following references:

- Operating Instructions SINAMICS G120D Inverter with CU240D-2 Control Units.
 - Operating Instructions SINAMICS G120D Inverter with CU250D-2 Control Units.

Unit group and unit selection

The standard unit of a parameter is specified in square parentheses after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be switched over.

Example:

Unit group: 7_1, unit selection: p0505

The parameter belongs to unit group 7_1 and the unit can be switched over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 2-3 Unit group (p0100)

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

Parameter values

| | |
|-----------------|---|
| Min | Minimum value of the parameter [unit] |
| Max | Maximum value of the parameter [unit] |
| Factory setting | Value when delivered [unit] In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0]. A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings. Reason: The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on device type, power unit). |

Description

Explanation of the function of a parameter.

Values

Lists the possible values of a parameter.

Recommendation

Information about recommended settings.

Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:
The adjustment range and unit apply to all indices.
- Factory setting:
When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.
When the indices have different factory settings, they are all listed individually with the unit.

Bit field

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 0 and 1
- Function diagram (FP) (optional).

The signal is shown on this function diagram.

Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

Where necessary, "Refer to:" indicates the following information:

- List of other relevant parameters to be considered.
- List of faults and alarms to be considered.

Safety guidelines

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

Danger

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

Warning

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

Caution

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

Notice

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

2.1.2 Number ranges of parameters

Note:

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters (Page 29)".

Parameters are grouped into the following number ranges:

Table 2-6 Number ranges for SINAMICS

| Range | | Description |
|-------|------|---|
| From | To | |
| 0000 | 0099 | Display and operation |
| 0100 | 0199 | Commissioning |

| r0020 | Speed setpoint smoothed / Speed setpoint | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2000 | Dyn. index: - |
| | Unit group: 3_1 | Unit selection: p0505 | Function diagram: 5020, 6799 |
| | Min: | Max: | Factory setting: |
| | - [rpm] | - [rpm] | - [rpm] |
| Description: | Displays the currently smoothed speed setpoint at the input of the speed controller or U/f characteristic (after the interpolator). | | |
| Dependency: | See also: r0060 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed setpoint is available smoothed (r0020) and unsmoothed (r0060). | | |

| | | | |
|---------------------|---|------------------------------|---|
| r0021 | CO: Actual speed smoothed / Actual speed | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2000 | Dyn. index: - |
| | Unit group: 3_1 | Unit selection: p0505 | Function diagram: 6799 |
| | Min: - [rpm] | Max: - [rpm] | Factory setting: - [rpm] |
| Description: | Display and connector output for the calculated and smoothed rotor speed. Frequency components from the slip compensation (for induction motors) are not included. | | |
| Dependency: | See also: r0022, r0063 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0063). | | |
| r0022 | Actual speed rpm smoothed / Actual speed | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2000 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [rpm] | Max: - [rpm] | Factory setting: - [rpm] |
| Description: | Displays the calculated and smoothed rotor speed. Frequency components from the slip compensation (for induction motors) are not included. r0022 is identical to r0021, however, it always has units of rpm and contrary to r0021 cannot be changed over. | | |
| Dependency: | See also: r0021, r0063 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0063). | | |
| r0024 | Output frequency smoothed / Output frequency | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2000 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6300, 6799 |
| | Min: - [Hz] | Max: - [Hz] | Factory setting: - [Hz] |
| Description: | Displays the smoothed output frequency. Frequency components from the slip compensation (for induction motors) are included. | | |
| Dependency: | See also: r0066 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The output frequency is available smoothed (r0024) and unsmoothed (r0066). | | |
| r0025 | CO: Output voltage smoothed / Output voltage | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2001 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 5730, 6300, 6799 |
| | Min: - [Vrms] | Max: - [Vrms] | Factory setting: - [Vrms] |
| Description: | Displays the smoothed output voltage of the power unit. | | |
| Dependency: | See also: r0072 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The output voltage is available smoothed (r0025) and unsmoothed (r0072). | | |

| | | | |
|---------------------|---|--------------------------|-------------------------------------|
| r0026 | CO: DC link voltage smoothed / DC link voltage | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2001 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [V] | Max: - [V] | Factory setting: - [V] |
| Description: | Displays the smoothed actual value of the DC link voltage. | | |
| Dependency: | See also: r0070 | | |
| Notice: | When measuring a DC link voltage < 200 V, for the Power Module a valid measured value is not supplied. In this case, when an external 24 V power supply is connected, a value of approx. 24 V is displayed in the display parameter. | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The DC link voltage is available smoothed (r0026) and unsmoothed (r0070). r0026 sets itself to the lower value of the pulsating DC link voltage. | | |
| r0027 | CO: Absolute actual current smoothed / Motor current | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2002 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [Arms] | Max: - [Arms] | Factory setting: - [Arms] |
| Description: | Displays the smoothed absolute actual current value. | | |
| Dependency: | See also: r0068 | | |
| Notice: | This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used. | | |
| Note: | Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The absolute current actual value is available smoothed (r0027) and unsmoothed (r0068). | | |
| r0028 | Modulation depth smoothed / Mod_depth smth | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2002 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [%] | Max: - [%] | Factory setting: - [%] |
| Description: | Displays the smoothed actual value of the modulation depth. | | |
| Dependency: | See also: r0074 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The modulation depth is available smoothed (r0028) and unsmoothed (r0074). | | |
| r0029 | Current actual value field-generating smoothed / Id_act smooth | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2002 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [Arms] | Max: - [Arms] | Factory setting: - [Arms] |
| Description: | Displays the smoothed field-generating actual current. | | |
| Dependency: | See also: r0076 | | |
| Note: | Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The field-generating current actual value is available smoothed (r0029) and unsmoothed (r0076). | | |

| | | | |
|---------------------|--|------------------------------|-------------------------------------|
| r0030 | Current actual value torque-generating smoothed / Iq_act smooth | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2002 | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 6799 |
| | Min: - [Arms] | Max: - [Arms] | Factory setting: - [Arms] |
| Description: | Displays the smoothed torque-generating actual current. | | |
| Dependency: | See also: r0078 | | |
| Note: | Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque-generating current actual value is available smoothed (r0030) and unsmoothed (r0078). | | |
| r0031 | Actual torque smoothed / Actual torque | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: p2003 | Dyn. index: - |
| | Unit group: 7_1 | Unit selection: p0505 | Function diagram: 5730, 6799 |
| | Min: - [Nm] | Max: - [Nm] | Factory setting: - [Nm] |
| Description: | Displays the smoothed torque actual value. | | |
| Dependency: | See also: r0080 | | |
| Note: | Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque actual value is available smoothed (r0031) and unsmoothed (r0080). | | |
| r0032 | CO: Active power actual value smoothed / Power | | |
| | Access level: 2 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: r2004 | Dyn. index: - |
| | Unit group: 14_10 | Unit selection: p0505 | Function diagram: 6799 |
| | Min: - [kW] | Max: - [kW] | Factory setting: - [kW] |
| Description: | Displays the smoothed actual value of the active power. | | |
| Dependency: | See also: r0082 | | |
| Notice: | This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used. | | |
| Note: | Power delivered at the motor shaft. The active power is available smoothed (r0032 with 100 ms) and unsmoothed (r0082). | | |
| r0033 | Torque utilization smoothed / M_util smooth | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: PERCENT | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 8012 |
| | Min: - [%] | Max: - [%] | Factory setting: - [%] |
| Description: | Displays the smoothed torque utilization as a percentage. The torque utilization is obtained from the required smoothed torque in reference to the torque limit, scaled using p2196. | | |
| Dependency: | This parameter is only available for vector control. For U/f control r0033 = 0 %. | | |

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 The torque utilization is available smoothed (r0033) and unsmoothed (r0081).
 For M_set total (r0079) > 0, the following applies:
 - Required torque = M_set total
 - Actual torque limit = M_max upper effective (r1538)
 For M_set total (r0079) <= 0, the following applies:
 - Required torque = - M_set total
 - Actual torque limit = - M_max lower effective (r1539)
 For the actual torque limit = 0, the following applies: r0033 = 100 %
 For the actual torque limit < 0, the following applies: r0033 = 0 %

| Unit group: - | Unit selection: - | Function diagram: 8017 |
| Min: | Max: | Factory setting: |
| - [%] | - [%] | - [%] |

Description: Display and connector output for the motor utilization from motor temperature model 1 (I2t) or 3.
 For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies:
 For firmware version < 4.7 SP6 or p0612.12 = 0:
 - r0034 = (motor model temperature - 40 K) / (p0605 - 40 K) * 100 %
 From firmware version 4.7 SP6 and p0612.12 = 1:
 - r0034 = (motor model temperature - p0613) / (p0605 - p0613) * 100 %
 For motor temperature model 3 (p0612.2 = 1), the following applies:
 - r0034 = (motor model temperature - r5397) / (r5398 - r5397) * 100 %

Dependency: The thermal motor utilization is only determined when the motor temperature model 1 (I2t) or 3 is activated.
 The following conditions are a prerequisite for additional information.
 - a temperature sensor has not been parameterized (p0600, p0601).
 - the current corresponds to the stall current (p0318).
 - speed n > 1 [rpm].
 For firmware version < 4.7 SP6 or p0612.12 = 0, the following applies:
 - the temperature model operates with an ambient temperature of 20 °C.
 A motor utilization of 100% is displayed (r0034 = 100 %) when the following conditions are permanently fulfilled:
 - the ambient temperature is 40 °C (model 1: p0625 = 40 °C, model 3: p0613 = 40 °C).
 From firmware version 4.7 SP6 and p0612.12 = 1, the following applies:
 - the ambient temperature can be adapted to the conditions using p0613.
 See also: p0605, p0611, p0612, p0613, p0627, r0632
 See also: F07011, A07012

Notice: After the drive is switched on, the system starts to determine the motor temperature with an assumed model value.
 This means that the value for the motor utilization is only valid after a stabilization time.

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 For r0034 = -200.0 %, the following applies:
 The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).

2 Parameters

2.2 List of parameters

Note: For r0035 not equal to -200.0 °C, the following applies:

- this temperature display is valid.
- a KTY/PT1000 temperature sensor is connected.
- the thermal model for the induction motor is activated (p0612 bit 1 = 1 and temperature sensor deactivated: p0600 = 0 or p0601 = 0).

For r0035 equal to -200.0 °C, the following applies:

- this temperature display is not valid (temperature sensor error).
- a PTC sensor or bimetallic NC contact is connected.
- the temperature sensor of the synchronous motor is deactivated (p0600 = 0 or p0601 = 0).

| Can be changed: - | Scaling: PERCENT | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8021 |

Description:

Displays the power unit overload determined using the I2t calculation.
A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.).
If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed.
In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.

r0037[0]: Maximum value of the inverter temperatures (r0037[5...10]).
r0037[1]: Maximum value of the depletion layer temperatures (r0037[13...18]).
r0037[2]: Maximum value of the rectifier temperatures (r0037[11...12]).
The maximum value is the temperature of the hottest inverter, depletion layer, or rectifier.
r0037[2, 3, 6, 11, 14...18] is only relevant for chassis power units.
In the case of a fault, the particular shutdown threshold depends on the power unit, and cannot be read out.

2 Parameters

2.2 List of parameters

Dependency: See also: r0026
Notice: When measuring a DC link voltage < 200 V, for the Power Module a valid measured value is not supplied. In this case, when an external 24 V power supply is connected, a value of approx. 24 V is displayed in the display parameter.
Note: The DC link voltage is available smoothed (r0026) and unsmoothed (r0070).

| Min: - [Vrms] | Max: - [Vrms] | Factory setting: - [Vrms] |

Description: Displays the maximum output voltage.
Dependency: The maximum output voltage depends on the actual DC link voltage (r0070) and the maximum modulation depth (p1803).
Note: As the (driven) motor load increases, the maximum output voltage drops as a result of the reduction in DC link voltage.

r0072 **CO: Output voltage / U_output**

Description: Display and connector output for the actual modulation depth.
Dependency: See also: r0028
Note: For space vector modulation, 100% corresponds to the maximum output voltage without overcontrol. Values above 100 % indicate an overcontrol condition - values below 100% have no overcontrol. The phase voltage (phase-to-phase, rms) is calculated as follows: $(r0074 \times r0070) / (\sqrt{2} \times 100 \%)$. The modulation depth is available smoothed (r0028) and unsmoothed (r0074).

| Description: | Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201. | | |
| Note: | The parameter is used to identify when the drive is being commissioned for the first time. The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2). When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted. | | |

Description: The duty cycles can be overloaded provided that the drive converter is operated with its base load current before and after the overload. This is based on a load duty cycle of 300 s.

2 Parameters

2.2 List of parameters

| | |
|--------------------|--|
| Value: | 0: Load duty cycle with high overload for vector drives 1: Load duty cycle with low overload for vector drives 6: S1 duty cycle (for internal use) 7: S6 duty cycle (for internal use) |
| Dependency: | See also: r3996 |
| Notice: | The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970). When the power unit use is changed, short-term communication interruptions may occur. |
| Note: | When the parameter is changed, all of the motor parameters (p0305 ... p0311), the technological application (p0500) and the control mode (p1300) are pre-assigned according to the selected application. The parameter has no influence when calculating the thermal overload. p0205 can only be changed to the settings that are saved in the power unit EEPROM. |

| Description: | Sets the drive unit supply voltage (rms value of the phase-to-phase line supply voltage). | | |
| Dependency: | Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0. The switch-in thresholds of the Vdc_max controller (r1242, r1282) are then directly determined using p0210. | | |
| Notice: | If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the Vdc controller may be automatically deactivated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm A07401 is output. | | |

2 Parameters

2.2 List of parameters

| | |
|--------------------|--|
| Dependency: | The following parameters are influenced using p0230: p0230 = 1: --> p0233 (power unit, motor reactor) = filter inductance p0230 = 4: --> p0290 (power unit overload response) = inhibit pulse frequency reduction --> p1802 (modulator modes) = space vector modulation without overcontrol The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted. --> p0233 (power unit, motor reactor) = filter inductance --> p0234 (power unit sine-wave filter capacitance) = filter capacitance --> p1082 (maximum speed) = Fmax filter / pole pair number --> p1800 (pulse frequency) >= nominal pulse frequency of the filter See also: p0233, p0234, p0290, p1082, p1800, p1802 |
| Note: | If a filter type cannot be selected, then this filter type is not permitted for the power unit. For sine-wave filters, the test pulse evaluation to detect short-circuits is always deactivated. p0230 = 1: Power units with output reactor are limited to output frequencies of 150 Hz. |

| Can be changed: C(1), U, T | Scaling: - |
| Unit group: - | Unit selection: - |
| Min: 0.000 [mH] | Max: 1000.000 [mH] |
| Description: | Enter the inductance of a filter connected at the power unit output. |
| Dependency: | This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. See also: p0230 |
| Note: | When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out. The parameter cannot be changed if the power unit has an internal sine-wave filter. |

| | |
|-----------------------------------|--|
| p0234 | Power unit sine-wave filter capacitance / PU sine filter C |
| Access level: 2 | Calculated: - |
| Can be changed: C(1), U, T | Scaling: - |
| Unit group: - | Unit selection: - |
| Min: 0.000 [µF] | Max: 1000.000 [µF] |
| Description: | Enters the capacitance of a sine-wave filter connected at the power unit output. |
| Dependency: | This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. See also: p0230 |

Note: The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground).
When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).
The parameter cannot be changed if the power unit has an internal sine-wave filter.

Description: Displays the power unit fan operating hours.

The number of hours operated can only be reset to 0 in this parameter (e.g. after a fan has been replaced).

Dependency: See also: A30042

Note: For liquid-cooled chassis power units, the operating hours of the inner fan are displayed in p0251 and not in p0254.

| | Min: | Max: | Factory setting: |
| | 0.0 [%] | 100.0 [%] | [0] 6.0 [%] [1] 16.0 [%] |

Description: Sets the shutdown thresholds for the ground fault monitoring.

The setting is made as a percentage of the maximum current of the power unit (r0209).

Index: [0] = Threshold at which precharging starts

[1] = Threshold at which precharging stops

Dependency: See also: p1901

| p0290 | Power unit overload response / PU overld response | | |
| | Access level: 3 | Calculated: - | Data type: Integer16 |
| | Can be changed: T | Scaling: - | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: 8021 |
| | Min: 0 | Max: 13 | Factory setting: 2 |
| Description: | <p>Sets the response to a thermal overload condition of the power unit. The following quantities can result in a response to thermal overload:</p> <ul style="list-style-type: none"> - heat sink temperature (r0037[0]). - chip temperature (r0037[1]). - power unit overload I2t (r0036). <p>Possible measures to avoid thermal overload:</p> <ul style="list-style-type: none"> - reduce the output current limit r0289 and r0067 (for closed-loop speed or torque control) or the output frequency (for U/f control indirectly via the output current limit and the intervention of the current limiting controller). - reduce the pulse frequency. <p>A reduction, if parameterized, is always realized after an appropriate alarm is output.</p> | | |
| Value: | <p>0: Reduce output current or output frequency 1: No reduction shutdown when overload threshold is reached 2: Reduce I_output or f_output and f_pulse (not using I2t) 3: Reduce the pulse frequency (not using I2t) 12: I_output or f_output and automatic pulse frequency reduction 13: Automatic pulse frequency reduction</p> | | |
| Dependency: | <p>If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1). For a thermal power unit overload, an appropriate alarm or fault is output, and r2135.15 or r2135.13 set. See also: r0036, r0037, p0230, r2135 See also: A05000, A05001, A07805</p> | | |
| Notice: | <p>If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.</p> | | |
| Note: | <p>The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans). Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through. For p0290 = 2, 3, 12, 13, the I2t overload detection of the power unit does not influence the response "Reduce pulse frequency". When the motor data identification routine is selected, p0290 cannot be changed. For short-circuit/ground fault detection, when the test pulse evaluation is active via p1901 "Test pulse evaluation configuration", the pulse frequency at the instant of switch on is briefly reduced.</p> | | |

Description: Sets the fan run-on time after the pulses for the power unit have been canceled.

Note:

- Under certain circumstances, the fan can continue to run for longer than was set (e.g. as a result of the excessively high heat sink temperature).
- For values less than 1 s, a 1 s run on time for the fan is active.

 A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.
 Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.
 This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.
 For SIEMENS reluctance motors (p0300 = 6), only commissioning with a valid motor code number in p0301 is permissible.

Description: Selecting the motor type.
 The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:
 1 = induction motor
 2 = synchronous motor
 6 = synchronous reluctance motor
 xx = motor without code number
 xxx = motor with code number
 The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/IOP).
 The following applies for values < 100:
 Motor data must be manually entered.
 The following applies for values >= 100:
 Motor data are automatically loaded from an internal list.

Value:

| | |
|------|--|
| 0: | No motor |
| 1: | Induction motor |
| 2: | Synchronous motor |
| 10: | 1LE1 induction motor (not a code number) |
| 13: | 1LG6 induction motor (not a code number) |
| 17: | 1LA7 induction motor (not a code number) |
| 19: | 1LA9 induction motor (not a code number) |
| 100: | 1LE1 induction motor |
| 101: | 1PC1 induction motor |
| 105: | 1LE5 induction motor |

Dependency: When selecting p0300 = 10 ... 19, parameters p0335, p0626, p0627, and p0628 of the thermal motor model are pre-assigned as a function of p0307 and p0311.

Caution: If a motor is selected, which is not contained in the motor lists (p0300 < 100), then the motor code number must be reset (p0301 = 0), if previously a motor was parameterized from the motor list.

Notice: If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 1 for p0301 = 1xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.
 The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):
 Type/code number ranges
 100 / 100xx, 110xx, 120xx, 130xx, 140xx, 150xx
 271 / 271xx, 281xx
 277 / 277xx, 287xx, 297xx
 60y / 60yxx

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0 | Max: 65535 | Factory setting: 0 |
| Description: | The parameter is used to select a motor from a motor parameter list. When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists. | | |
| Dependency: | Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. See also: p0300 | | |
| Note: | The motor code number can only be changed if the matching catalog motor was first selected in p0300. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected. If a change is made to a non-catalog motor, then the motor code number should be reset (p0301 = 0). | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 1 | Max: 50 | Factory setting: 1 |
| Description: | Sets the number (count) of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated. The following should be observed in motors connected in parallel: Rating plate data should only be entered for one motor: p0305, p0307 The following parameters are also only valid for one motor: p0320, p0341, p0344, p0350 ... p0361 All other motor parameters take into account the replacement/equivalent motor (e.g. r0331, r0333). | | |
| Recommendation: | For motors connected in parallel, external thermal protection should be provided for each individual motor. | | |
| Dependency: | See also: r0331, r0370, r0373, r0374, r0376, r0377, r0382 | | |
| Caution: | The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)). The mounting regulations when connecting motors in parallel must be carefully maintained! The number of motors set must correspond to the number of motors that are actually connected in parallel. After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1, p3900 > 0). For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies: - an individual motor must not be loaded beyond its stall point. | | |
|  | | | |
| Notice: | If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. | | |
| Note: | Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel. | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.000 | Max: 1.000 | Factory setting: 0.000 |
| Description: | Sets the rated motor power factor (cos phi, rating plate). For a parameter value of 0.000, the power factor is internally calculated and displayed in r0332. | | |
| Dependency: | This parameter is only available for p0100 = 0, 2. See also: p0100, p0309, r0332 | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. | | |

| | Unit group: - | Unit selection: - | Function diagram: 6301 |
| | Min: 0.00 [Hz] | Max: 650.00 [Hz] | Factory setting: 0.00 [Hz] |
| Description: | Sets the rated motor frequency (rating plate). | | |
| Dependency: | The number of pole pairs (r0313) is automatically re-calculated when the parameter is changed (together with p0311), if p0314 = 0. The rated frequency is restricted to values between 1.00 Hz and 650.00 Hz. See also: p0311, r0313, p0314 | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0310 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. The pre-assignment has been completed if the status display r3996 returns to zero. | | |
| Note: | The parameters are preassigned according to the specific power unit once the Control Unit has been powered up for the first time or when the factory settings have been restored. | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.0 [rpm] | Max: 210000.0 [rpm] | Factory setting: 0.0 [rpm] |
| Description: | Sets the rated motor speed (rating plate). For p0311 = 0, the rated motor slip of induction motors is internally calculated and displayed in r0330. It is especially important to correctly enter the rated motor speed for vector control and slip compensation for U/f control. | | |
| Dependency: | If p0311 is changed and for p0314 = 0, the pole pair (r0313) is re-calculated automatically. See also: p0310, r0313, p0314 | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0311 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. | Description: | Sets the motor pole pair number. p0314 = 1: 2-pole motor p0314 = 2: 4-pole motor, etc. | | |
| Dependency: | For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313. | | |
| Notice: | If p0314 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. For induction motors, it is only necessary to enter the value if the rated motor slip is so high that the pole pair number r0313, obtained when making the calculation based on the rated frequency and rated speed, is too low. | | |

2 Parameters

2.2 List of parameters

Dependency: See also: r0334
Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note: This parameter is not used for induction motors (p0300 = 1xx).

p0318[0...n] Motor stall current / Mot I_standstill

| Unit group: - | Unit selection: - | Function diagram: 8017 |
| Min: 0.00 [Arms] | Max: 10000.00 [Arms] | Factory setting: 0.00 [Arms] |

Description: Sets the stall current for synchronous motors (p0300 = 2xx), as well as for synchronous reluctance motors (p0300 = 6xx).
Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note: The parameter is used for the I2t monitoring of the motor (refer to p0611). This parameter is not used for induction motors (p0300 = 1xx).

p0320[0...n] Motor rated magnetizing current/short-circuit current / Mot I_mag_rated

|-----------------------------|--------------------------------|---|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.000 [Arms] | Max: 5000.000 [Arms] | Factory setting: 0.000 [Arms] |

Description: Induction motors:
Sets the rated motor magnetizing current.
For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331.
Synchronous motors:
Sets the rated motor short-circuit current.
Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note: The magnetizing current p0320 for induction motors is reset when quick commissioning is exited with p3900 > 0. If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.

p0322[0...n] Maximum motor speed / Mot n_max

| Access level: 1 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: C(1, 3) | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.0 [rpm] | Max: 210000.0 [rpm] | Factory setting: 0.0 [rpm] |

Description: Sets the maximum motor speed.
Dependency: See also: p1082
Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
If p0322 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly.
Note: The parameter has no significance for a value of p0322 = 0.

| | | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00 [Arms] | Max: 20000.00 [Arms] | Factory setting: 0.00 [Arms] |
| Description: | Sets the maximum permissible motor current (e.g. de-magnetizing current for synchronous motors). | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0323 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. | | |
| Note: | The parameter has no effect for induction motors. The parameter has not effect for synchronous motors if a value of 0.0 is entered. The user-selectable current limit is entered into p0640. | | |
| p0325[0...n] | Motor pole position identification current 1st phase / Mot PolID I 1st Ph | | |

| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.000 [Arms] | Max: 10000.000 [Arms] | Factory setting: 0.000 [Arms] |
| Description: | Sets the current for the 1st phase of the two-stage technique for pole position identification routine. The current of the 2nd phase is set in p0329. The two-stage technique is selected with p1980 = 4. | | |
| Dependency: | See also: p0329, p1980, r1984, r1985, r1987 See also: F07969 | | |
| Notice: | When the motor code (p0301) is changed, it is possible that p0325 is not pre-assigned. p0325 can be pre-assigned using p0340 = 3. | | |
| Note: | The value is automatically pre-assigned for the following events: - For p0325 = 0 and automatic calculation of the closed-loop control parameters (p0340 = 1, 2, 3). - for quick commissioning (p3900 = 1, 2, 3). | | |
| p0326[0...n] | Motor stall torque correction factor / Mot M_stall_corr | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 5 [%] | Max: 300 [%] | Factory setting: 100 [%] |
| Description: | Sets the correction factor for the stall torque/force at a 600 V DC link voltage. | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. | | |
| Note: | When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300). | | |
| p0327[0...n] | Optimum motor load angle / Mot phi_load opt | | |

| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: 6721 |
| | Min: 0.0 [°] | Max: 135.0 [°] | Factory setting: 90.0 [°] |
| Description: | Sets the optimum load angle for synchronous motors with reluctance torque. The load angle is measured at the rated motor current. | | |

2 Parameters

2.2 List of parameters

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: This parameter has no significance for induction motors.
For synchronous motors without reluctance torque, a angle of 90 degrees must be set.
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

p0328[0...n] Motor reluctance torque constant / Mot kT_reluctance

| | | |
|------------------------------|-----------------------------|--------------------------------------|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: -1000.00 [mH] | Max: 1000.00 [mH] | Factory setting: 0.00 [mH] |

Description: Sets the reluctance torque constant for synchronous motors with reluctance torque (e.g. 1FE ... motors).
This parameter has no significance for induction motors.

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: For synchronous motors without reluctance torque, the value 0 must be set.

p0329[0...n] Motor pole position identification current / Mot PolID current

| | | |
|------------------------------|----------------------------------|--|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.0000 [Arms] | Max: 10000.0000 [Arms] | Factory setting: 0.0000 [Arms] |

Description: Sets the current for the pole position identification routine (p1980 = 1).
For a two-stage technique (p1980 = 4), the current is set for the 2nd phase.
The current for the 1st phase is set in p0325.

Dependency: If a maximum current (p0323) was not parameterized, then p0329 is limited to the rated motor current.
If p0329 is too small in order to determine the pole position (for p1980 = 1), then p0323 must be first parameterized and significantly greater than p0329.

See also: F07969

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

r0330[0...n] Rated motor slip / Mot slip_rated

| | | |
|--------------------------|--------------------------|-----------------------------------|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: - [Hz] | Max: - [Hz] | Factory setting: - [Hz] |

Description: Displays the rated motor slip.

Dependency: The rated slip is calculated from the rated frequency, rated speed and number of pole pairs.
See also: p0310, p0311, r0313

Note: The parameter is not used for synchronous motors (p0300 = 2xx).

| r0331[0...n] | Actual motor magnetizing current/short-circuit current / Mot I_mag_rtd act | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: 6722, 6724 |
| | Min: - [Arms] | Max: - [Arms] | Factory setting: - [Arms] |
| Description: | Induction motor: Displays the rated magnetizing current from p0320. For p0320 = 0, the internally calculated magnetizing current is displayed. Synchronous motor: Displays the rated short-circuit current from p0320. | | |
| Dependency: | If p0320 was not entered, then the parameter is calculated from the rating plate parameters. | | |
| r0332[0...n] | Rated motor power factor / Mot cos phi rated | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: - | Max: - | Factory setting: - |
| Description: | Displays the rated power factor for induction motors. For IEC motors, the following applies (p0100 = 0): For p0308 = 0, the internally calculated power factor is displayed. For p0308 > 0, this value is displayed. For NEMA motors, the following applies (p0100 = 1, 2): For p0309 = 0, the internally calculated power factor is displayed. For p0309 > 0, this value is converted into the power factor and displayed. | | |
| Dependency: | If p0308 is not entered, the parameter is calculated from the rating plate parameters. | | |
| Note: | The parameter is not used for synchronous motors (p0300 = 2xx). | | |
| r0333[0...n] | Rated motor torque / Mot M_rated | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: 7_4 | Unit selection: p0100 | Function diagram: - |
| | Min: - [Nm] | Max: - [Nm] | Factory setting: - [Nm] |
| Description: | Displays the rated motor torque. | | |
| Dependency: | IEC drives (p0100 = 0): unit Nm NEMA drives (p0100 = 1): unit lbf ft | | |
| Note: | For induction motors, r0333 is calculated from p0307 and p0311. For synchronous motors, r0333 is calculated from p0305, p0316, p0327 and p0328. | | |
| r0334[0...n] | Actual motor-torque constant / Mot kT act | | |
| | Access level: 4 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: 28_1 | Unit selection: p0100 | Function diagram: - |
| | Min: - [Nm/A] | Max: - [Nm/A] | Factory setting: - [Nm/A] |
| Description: | Displays the torque constant of the synchronous motor used. | | |
| Dependency: | IEC drives (p0100 = 0): unit Nm / A NEMA drives (p0100 = 1): unit lbf ft / A | | |
| Note: | This parameter is not used for induction motors (p0300 = 1xx). For synchronous motors, parameter r0334 is calculated from p0305, p0307 and p0311. | | |

| | | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0 | Max: 128 | Factory setting: 0 |
| Description: | Sets the motor cooling system used. | | |
| Value: | 0: Natural ventilation 1: Forced cooling 2: Liquid cooling 128: No fan | | |
| Dependency: | For 1LA7 motors (p0300), the parameter is pre-set as a function of p0307 and p0311. | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. | | |
| Note: | The parameter influences the thermal 3-mass motor model. 1LA7 motors, frame size 56 are operated without fan. | | |

- Note:** p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5.
p0340 = 2 calculates the motor parameters (p0350 ... p0360).
p0340 = 3 contains the calculations of p0340 = 4, 5.
p0340 = 4 only calculates the controller parameters.
p0340 = 5 only calculates the controller limits.
When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.
At the end of the calculations, p0340 is automatically set to 0.

| p0341[0...n] | Motor moment of inertia / Mot M_mom of inert | | |

| | Min: 0.0 [kg] | Max: 50000.0 [kg] | Factory setting: 0.0 [kg] |
| Description: | Sets the motor weight. | | |
| Dependency: | IEC drives (p0100 = 0): unit kg NEMA drives (p0100 = 1): unit lb | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. | | |
| Note: | The parameter influences the thermal 3 mass model of the induction motor. The parameter is not used for synchronous motors (p0300 = 2xx). | | |
| r0345[0...n] | Nominal motor starting time / Mot t_{start} rated | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: - | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: - [s] | Max: - [s] | Factory setting: - [s] |
| Description: | Displays the rated motor starting time. This time corresponds to the time from standstill up to reaching the motor rated speed and the acceleration with motor rated torque (r0333). | | |
| Dependency: | See also: r0313, r0333, p0341, p0342 | | |
| p0346[0...n] | Motor excitation build-up time / Mot t_{excitation} | | |
| | Access level: 3 | Calculated: p0340 = 1,3 | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.000 [s] | Max: 20.000 [s] | Factory setting: 0.000 [s] |
| Description: | Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time. | | |
| Caution: | If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note). | | |
|  | | | |
| Note: | The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled. | | |

| | | | |
|---|--|---------------------------------|--|
| p0347[0...n] | Motor de-excitation time / Mot t_de-excitat | | |
| | Access level: 3 | Calculated: p0340 = 1,3 | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.000 [s] | Max: 20.000 [s] | Factory setting: 0.000 [s] |
| Description: | Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time. | | |
| Note: | The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating). | | |
| p0350[0...n] | Motor stator resistance cold / Mot R_stator cold | | |
| | Access level: 3 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00000 [ohm] | Max: 2000.00000 [ohm] | Factory setting: 0.00000 [ohm] |
| Description: | Sets the stator resistance of the motor at ambient temperature p0625 (phase value). | | |
| Dependency: | See also: p0625, r1912 | | |
| Notice: | When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. | | |
| Note: | The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance (p0352). | | |
| p0352[0...n] | Cable resistance / R_cable | | |
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00000 [ohm] | Max: 120.00000 [ohm] | Factory setting: 0.00000 [ohm] |
| Description: | Resistance of the power cable between the power unit and motor. | | |
| Caution: | The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated. | | |
|  | | | |
| Note: | The parameter influences the temperature adaptation of the stator resistance. The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value. The cable resistance is reset when quick commissioning is exited with p3900 > 0. If the stator resistance is available in a motor list, and if p0352 is still zero, then the cable resistance is generated from the difference between the measured value and list value. | | |
| p0354[0...n] | Motor rotor resistance cold / Mot R_r cold | | |
| | Access level: 3 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 |
| | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: 6727 |
| | Min: 0.00000 [ohm] | Max: 300.00000 [ohm] | Factory setting: 0.00000 [ohm] |
| Description: | Sets the rotor/secondary section resistance of the motor at the ambient temperature p0625. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor data identification routine (p1910). | | |

2 Parameters

2.2 List of parameters

Dependency: See also: p0625
Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note: The parameter is not used for synchronous motors (p0300 = 2).

p0356[0...n] Motor stator leakage inductance / Mot L_stator leak.

| | | |
|-----------------------------|--------------------------------|---|
| Access level: 3 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.00000 [mH] | Max: 1000.00000 [mH] | Factory setting: 0.00000 [mH] |

Description: Induction machine: sets the stator leakage inductance of the motor.
Synchronous motor: Sets the stator quadrature axis inductance of the motor.
This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).
For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.

p0357[0...n] Motor stator inductance d axis / Mot L_stator d

| | | |
|-----------------------------|--------------------------------|---|
| Access level: 3 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.00000 [mH] | Max: 1000.00000 [mH] | Factory setting: 0.00000 [mH] |

Description: Sets the stator direct-axis inductance of the synchronous motor.
This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

Note: For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is ideal for a low current.

p0358[0...n] Motor rotor leakage inductance / Mot L_rot leak

| | | |
|-----------------------------|--------------------------------|---|
| Access level: 3 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 6727 |
| Min: 0.00000 [mH] | Max: 1000.00000 [mH] | Factory setting: 0.00000 [mH] |

Description: Sets the rotor/secondary section leakage inductance of the motor.
The value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: If the rotor leakage inductance (p0358) for induction motors is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).

| Notice: | This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection. | | | | |

2 Parameters

2.2 List of parameters

Note: ZM: Zero mark
 For bit 12 (equidistant zero mark):
 The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).
 The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.
 For bit 13 (irregular zero mark):
 The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.
 For bit 14 (distance-coded zero mark):
 The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

| | 12 | Equidistant zero mark | Yes | No | - |
| | 13 | Irregular zero mark | Yes | No | - |
| | 14 | Distance-coded zero mark | Yes | No | - |
| | 21 | Voltage level 24 V | Yes | No | - |

Notice: This parameter is automatically pre-set for encoders from the encoder list (p0400).
 When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

Note: ZM: Zero mark
 For bit 12 (equidistant zero mark):
 The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).
 The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.
 For bit 13 (irregular zero mark):
 The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.
 For bit 14 (distance-coded zero mark):
 The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

| Can be changed: C(4) | Scaling: - | Dyn. index: EDS, p0140 |
| Unit group: - | Unit selection: - | Function diagram: 4704 |
| Min: | Max: | Factory setting: |
| - | - | 0000 bin |

Description: Sets the configuration for position tracking of a measuring gear.

| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
|------------|-----|--|-------------|-------------|----|
| | 00 | Measuring gear activate position tracking | Yes | No | - |
| | 01 | Axis type | Linear axis | Rotary axis | - |
| | 02 | Measuring gear reset position | Yes | No | - |
| | 03 | Meas. gearbox, activate pos. tracking for incremental encoders | Yes | No | - |

Notice: For p0411.3 = 1 the following applies:

If position tracking is activated for incremental encoders, only the position actual value is stored. Axis or encoder motion is not detected when deactivated! Any tolerance window entered in p0413 has no effect.

Note: For the following events, the non-volatile, saved position values are automatically reset:
 - when an encoder replacement has been identified.
 - when changing the configuration of the Encoder Data Set (EDS).

p0412[0...n] Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev

| Unit group: - | Unit selection: - | Function diagram: 4704 |
| Min: | Max: | Factory setting: |
| 0 | 4194303 | 0 |

Description: Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.

Dependency: This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).

Note: The resolution that is set must be able to be represented using r0483.

For rotary axes/modulo axes, the following applies:

p0411.0 = 1:

This parameter is pre-set with p0421 and can be changed.

p0411.3 = 1:

The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

For linear axes, the following applies:

p0411.0 = 1:

This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.

p0411.3 = 1:

The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

| p0413[0...n] | Measuring gear position tracking tolerance window / Pos track window | | |
|---------------------|---|------------------------------|-----------------------------------|
| | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| | Can be changed: C(4) | Scaling: - | Dyn. index: EDS, p0140 |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00 | Max: 4294967300.00 | Factory setting: 0.00 |
| Description: | Sets a tolerance window for position tracking. After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output. Rotation, e.g. through a complete encoder range is not detected. | | |
| Caution: |  | | |
| Note: | | | |
| | The value is entered in integer (complete) encoder pulses. For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa). | | |

| p0418[0...n] | Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1 | | |
|---------------------|--|--------------------------|-------------------------------------|

| | Can be changed: C(4) | Scaling: - | Dyn. index: EDS, p0140 |
| | Unit group: - | Unit selection: - | Function diagram: 4010, 4704 |
| | Min: 2 | Max: 18 | Factory setting: 2 |
| Description: | Sets the fine resolution in bits of the incremental position actual values. | | |
| Note: | The parameter applies for the following process data: - Gx_XIST1 - Gx_XIST2 for reference mark or flying measurement The fine resolution specifies the fraction between encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048). For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information. For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy. | | |

Description: Sets the configuration of the Sensor Module.

| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
|-------------------|------------|--|------------------|-----------------|-----------|
| | 20 | Speed calculation mode (only SMC30) | Incremental diff | Flank time meas | - |
| | 21 | Zero mark tolerance | Yes | No | - |
| | 23 | De-select commutation with zero mark | Yes | No | - |
| | 25 | Switch off encoder voltage supply during parking | Yes | No | - |
| | 27 | Extrapolate position values | Yes | No | - |

Notice: A bit-wise configuration is only possible if the corresponding property is also present in r0458.

Note: For bit 20 (speed calculation mode):

- if bit = 1, the speed is calculated via incremental difference without extrapolation.
- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

For bit 21 (zero mark tolerance):

- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

For bit 25 (disconnect the encoder power supply on parking):

- if bit = 1, the encoder power supply is switched off on parking (0 V).
- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

For bit 27 (extrapolate position values):

- if bit = 1, the extrapolation of the position values is activated.

| CU240D-2_PN_F | Min: | Max: | Factory setting: |
| | -180.00 [°] | 180.00 [°] | 0.00 [°] |

Description: Sets the angular commutation offset.

Dependency: The value is taken into account in r0094.

See also: r0094, r1778

Notice: When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled:

- the motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx).
- the encoder is a resolver (p0404.23 = 1).
- the actual speed value is inverted (p0410.0 = 1).

The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).

Note: Angular commutation offset, angular difference between electrical position of encoder and flux position.

For p0404.5 = 1 (track C/D) the following applies:

The angular offset in p0431 acts on track A/B, the zero mark on track C/D.

For p0404.6 = 1 (Hall sensor) the following applies:

The angular offset in p0431 acts on track A/B and the zero mark.

| | 23 | Commutation with 180° | Yes | No | - |
| | 26 | Deselect track monitoring | Yes | No | - |

Dependency: See also: p0430, r0459

Note: A value of zero is displayed if an encoder is not present.

For bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

For bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.

For bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

For bits 05, 04:

The actual hardware only supports 1x or 4x signal evaluation.

Bit 5/4 = 0/0: Signal evaluation per period, 4x.

Bit 5/4 = 1/0: Illegal setting.

Bit 5/4 = 0/1: Signal evaluation per period, 1x.

Bit 5/4 = 1/1: Illegal setting.

For bit 06:

If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

For bit 11:

If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.

For bit 12:

Additional fault messages can be activated for extended fault diagnostics.

For bit 13:

When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn_XIST2 can be requested via Gn_STW.13. The absolute value is only valid after passing the zero mark.

For bit 26:

Track monitoring is deactivated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.

 - the encoder is parked.
 - the encoder is deactivated.
 - the encoder is being commissioned.
 - no parameterized encoder available.
 - encoder data set is being changed over.
 r0481.14 = 1 and r0481.15 = 1 has the following significance:
 An encoder error has occurred and the encoder position actual value (Gn_XIST1) is invalid.

- Note:**
- this value is reset if necessary when the "parking encoder" (r0481.14) function is de-selected.
 - in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
 - the update time for the position control (EPOS) corresponds to the position controller clock cycle p0115[4].
 - the update time in isochronous operation corresponds to the bus cycle time r2064[1].
 - the update time in isochronous operation and with position control (EPOS) corresponds to the position controller clock cycle p0115[4].
 - the update time in non-isochronous operation or without position control (EPOS) comprises the following:
Update time = 4 * least common multiple (LCM) of all current controller clock cycles (p0115[0]) in the drive group (infeed + drives).
The minimum update time is 1 ms.
Example 1: infeed, servo
Update time = 4 * LCM(250 µs, 125 µs) = 4 * 250 µs = 1 ms
Example 2: infeed, servo, vector
Update time = 4 * LCM(250 µs, 125 µs, 500 µs) = 4 * 500 µs = 2 ms

Description: Displays the encoder actual position value Gn_XIST2 according to PROFIdrive.

Recommendation: Possible causes:

For Error code = 4097, 4098: Defective Control Unit hardware.

For Error codes = 4099, 4100: Too many measuring pulses have occurred.

Notice:

The encoder position actual value must be requested using the encoder control word Gn_STW.13.

Note:

- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).

- if GxZSW.15 = 1 (r0481), then an error code with the following significance is located in Gx_XIST2 (r0483):

1: Encoder fault.

2: Possible position shift in Gx_XIST1.

3: Encoder parking not possible.

4: Cancellation, reference block search (e.g. reference mark not available or input terminal for external zero mark not set). Zero mark is requested, however according to p0404.12/13/14 there is no zero mark (alarm A07565).

5: Cancellation, fetch reference value (e.g. illegal change from reference mark search to flying measurement).

6: Cancel flying measuring (e.g. input terminal for probe not set).

7: Cancellation, fetch measured value (e.g. illegal change from flying measurement to reference mark search).

8: Abort, absolute value transfer.

3841: Function not supported.

4097: Abort, reference mark search due to an initialization error.

4098: Abort, flying measurement due to an initialization error.

4099: Abort, reference mark search due to a measuring error.

| Value: | 0: Encoder fault results in OFF2 1: Enc fault results in encoderless oper. and oper. continues 2: Encoder fault results in encoderless operation and OFF1 3: Encoder fault results in encoderless operation and OFF3 4: Encoder fault results in DC braking 5: Enc fault results in encoderless op, operation continues, alarm | | | |
| Dependency: | The following parameters are relevant for encoderless operation. | | | |
| Caution: | For a value = 1, 2, 3, 5 the following applies: - encoderless operation must have been started. For a value = 1, the following applies: - in spite of the motor encoder fault that has occurred, the motor continues to operate. | | | |
| |  | | | |

2 Parameters

2.2 List of parameters

Note: For a value = 1, 2, 3, 5 the following applies:

- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
- if, with r1407.13 = 1, a different drive data set is selected (e.g. interconnection from p0820), then the open-loop or closed-loop control type p1300 of this data set must match that of the original data set (e.g. p1300 = 21). Encoderless closed-loop controlled operation is kept when changing over.

For a value = 4, the following applies:

- the value can only be set for all data sets when p1231 = 4
- DC braking must be commissioned (p1232, p1233, p1234).

For a value = 5, the following applies:

Same function as for value = 1. However, faults are output as alarm and the message bit "Fault active" (r2139.3) is not set. The encoder fault has to be acknowledged via the encoder interface in order to resume operation with encoder.

Description: Sets the maximum permissible speed difference within the current controller sampling time.

Dependency: See also: r1408
See also: F07902, F31118, A31418

Note: For a value of 0.0, the speed change monitoring is disabled.
If the speed difference exceeds the threshold value p0492, depending on p0491, either encoderless closed-loop speed/torque control is selected or the drive is switched off with fault F3x118.

| Can be changed: U, T | Scaling: - | Dyn. index: EDS, p0140 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0 | Max: 23 | Factory setting: 0 |

Description: Sets the input terminal for selecting the reference mark via BERO/switching signal when performing referencing with several zero marks.
The encoder interface supplies the position of the reference mark, which was detected immediately after the positive edge of the BERO signal.

Value: 0: No selection via BERO
21: DI 1 (X07.2)
23: DI 3 (X08.2)

Dependency: See also: p0490

Note: Refer to the encoder interface for PROFIdrive.
For p0493 = 0 (factory setting) the following applies:
- there is no logic operation between the reference mark search and an input signal.
For p0493 > 0, the following applies:
- the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490.
- if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p2517, or p2518.

| | Can be changed: C(1), T | Scaling: - | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0 | Max: 2 | Factory setting: 0 |
| Description: | Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0340 = 5. | | |
| Value: | 0: Standard drive 2: Sensorless closed-loop control down to f = 0 (passive loads) | | |
| Notice: | If the technological application is set to p0500 = 0, 2 during commissioning (p0010 = 1, 5, 30), the operating mode (p1300) is pre-set accordingly. | | |

Note: The calculation of parameters dependent on the technology application can be called up as follows:

- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5

For p0500 = 0 and when the calculation is initiated, the following parameters are set:

- p1574 = 10 V
- p1750.2 = 0
- p1802 = 4 (SVM/FLB without overcontrol)
- p1803 = 106 %

For p0500 = 2 and when the calculation is initiated, the following parameters are set:

- p1574 = 2 V (separately excited synchronous motor: 4 V)
- p1750.2 = 1
- p1802 = 4 (SVM/FLB without overcontrol)
- p1803 = 106 %

For p1750:
The setting of p1750 is only relevant for induction motors.
p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.
This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.

For p1802/p1803:
p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

Dependency: The parameter can only be changed in an offline project using the commissioning software.

Caution: If a per unit representation is selected and if the reference parameters (e.g. p2000) are subsequently changed, then the physical significance of several control parameters is also adapted at the same time. As a consequence, the control behavior can change (see p1744, p1752, p1755).

Note: Reference parameter for the unit system % are, for example, p2000 ... p2004. Depending on what has been selected, these are displayed using either SI or US units.

Description: Sets the reference quantity for the technological units.

When changing over using changeover parameter p0595 to absolute units, all of the parameters involved refer to the reference quantity.

Dependency: See also: p0595
Notice: When changing over from one technological unit into another, or when changing the reference parameter, a changeover is not made.

p0601[0...n] Motor temperature sensor type / Mot_temp_sens type

| | | |
|-----------------------------|--------------------------|-------------------------------|
| Access level: 2 | Calculated: - | Data type: Integer16 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 8016 |
| Min: 0 | Max: 6 | Factory setting: 0 |

Description: Sets the sensor type for the motor temperature monitoring.

Value:
 0: No sensor
 1: PTC alarm & timer
 2: KTY84
 4: Bimetallic NC contact alarm & timer
 6: PT1000

Dependency: A thermal motor model is calculated corresponding to p0612.

Caution: For p0601 = 2, 6:
 If the motor temperature sensor is not connected but another encoder, then the temperature adaptation of the motor resistances must be switched out (p0620 = 0). Otherwise, in controlled-loop operation, torque errors will occur that will mean that the motor will not be able to be stopped.

Note: For p0601 = 1:
 Tripping resistance = 1650 Ohm. Wire breakage and short-circuit monitoring.

p0604[0...n] Mot_temp_mod 2/sensor alarm threshold / Mod 2/sens A_thr

| Min: 0.0 [°C] | Max: 240.0 [°C] | Factory setting: 130.0 [°C] |

Description: Sets the alarm threshold for monitoring the motor temperature for motor temperature model 2 or KTY/PT1000. After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started. If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.

Dependency: See also: p0606, p0612
 See also: F07011, A07910

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The hysteresis is 2 K.
 When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

| Description: | Sets the timer between the output of alarm and fault for a temperature sensor fault. If there is a sensor fault, this timer is started. If the sensor fault is still present after the timer has expired, a corresponding fault is output. | | |
| Notice: | The parameterized time is internally rounded-off to an integer multiple of 48 ms. | | |

| Note: | The I_max reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4). The I_max reduction results in a lower output frequency. If value = 0: An alarm is output and I_max is not reduced. For value = 1: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. - for KTY/PT1000, the following applies: I_max. is reduced - for PTC, the following is valid: I_max. is not reduced If value = 2: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. If value = 12: Behavior is always the same as for value 2. For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled. | | |

- Dependency:** The parameter is only used for synchronous motors (p0300 = 2xx, 4) and synchronous reluctance motors (p0300 = 6xx).
See also: r0034, p0612, p0615
See also: F07011, A07012, A07910
- Notice:** This parameter is automatically pre-set from the motor database for motors from the motor list (p0301).
When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.
When exiting commissioning, p0612 is checked, and where relevant, is pre-assigned to a value that matches the motor power, if a temperature sensor was not parameterized (see p0601).
- Note:** When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (refer to p0612).
If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

2 Parameters

2.2 List of parameters

Note: Mot_temp_mod: motor temperature model

For bit 00:
This bit is used to activate/deactivate the motor temperature model for permanent-magnet synchronous motors and synchronous reluctance motors.

For bit 01 (see also bit 9):
This bit is used to activate/deactivate the motor temperature model for induction motors.

For bit 02:
This bit is used to activate/deactivate the motor temperature model for 1FK7 Basic and 1FL5 motors.
Motor temperature model 3 cannot be simultaneously activated with another motor temperature model.

For bit 08:
This bit is used to extend the motor temperature model 1 (I2t).
The following applies for firmware version < 4.7 SP6 (only bit 0):
- this bit has no function. Temperature model 1 operates in the standard mode.
Overtemperature at rated load: p0605 - 40 °C
Alarm threshold: p0605
Fault threshold: p0615
The following applies from firmware version 4.7 SP6 (bits 0 and 8):
- temperature model 1 operates in the extended mode.
Overtemperature at rated load: p0627
Alarm threshold: p5390
Fault threshold: p5391

For bit 09:
This bit is used to extend the motor temperature model 2.
For firmware version < 4.7 following applies (only bit 1):
- this bit has no function. Temperature model 2 operates in the standard mode.
From firmware version 4.7 the following applies (bits 1 and 9):
- this bit should be set. Temperature model 2 then operates in the extended mode and the result of the model is more precise.

For bit 12 (only effective if a temperature sensor has not been parameterized):
This bit is used to set the ambient temperature for the motor temperature model 1 (I2t).
The following applies for firmware version < 4.7 SP6 (only bit 0):
- this bit has no function. Temperature model 1 operates with an ambient temperature of 20 °C.
The following applies from firmware version 4.7 SP6 (bits 0 and 12):
- the ambient temperature can be adapted to the conditions using p0613.

The parameter is not relevant.
From firmware version 4.7 SP6 and p0612.12 = 1, the following applies:
The parameter defines the current ambient temperature.
- temperature model 3 (p0612.2 = 1):
The parameter defines the current ambient temperature.

| p0628[0...n] | Motor overtemperature rotor / Mot T_{over} rotor | | |
| Access level: 4 | Calculated: p0340 = 1,2 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: 21_2 | Unit selection: p0505 | Function diagram: 8018 | |
| Min: 20 [K] | Max: 200 [K] | Factory setting: 100 [K] | |

Description: Defines the rated overtemperature of the squirrel cage rotor referred to ambient temperature in the motor temperature model 2 (p0612.1 = 1).

Dependency: For 1LA7 motors (p0300), the parameter is pre-set as a function of p0307 and p0311.
See also: p0625

Notice: When selecting a standard induction motor listed in the catalog (p0300 > 100, p0301 > 10000), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

| | Unit group: - | Unit selection: - | Function diagram: 6640 |
| | Min: 0.00 [Arms] | Max: 10000.00 [Arms] | Factory setting: 0.00 [Arms] |
| Description: | Sets the current limit. | | |
| Dependency: | See also: r0209, p0323 | | |
| Note: | The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305. The current limit p0640 is limited to r0209. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the power unit. The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5. p0640 is limited to 4.0 x p0305. p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]). p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0). | | |

| Description: | Displays the operating hours for the corresponding motor. The motor operating time counter continues to run when the pulses are enabled. When the pulse enable is withdrawn, the counter is held and the value saved. | | |
| Dependency: | See also: p0651 See also: A01590 | | |
| Note: | For p0651 = 0, the operating hours counter is disabled. The operating hours counter in p0650 can only be reset to 0. The operating hours counter only runs with drive data set 0 and 1 (DDS). | | |

| Description: | Sets the service/maintenance intervals in hours for the appropriate motor. An appropriate message is output when the operating hours set here are reached. | | |
| Dependency: | See also: p0650 See also: A01590 | | |
| Note: | For p0651 = 0, the operating hours counter is disabled. When setting p0651 to 0, then p0650 is automatically set to 0. The operating hours counter only runs with drive data set 0 and 1 (DDS). If there is no temperature monitor, then interconnect to a fixed value. | Description: | <p>Sets the transfer direction and start of data transfer between the memory card and non-volatile device memory.</p> <p>Example 1: The parameter backup is to be transferred from the non-volatile device memory to the memory card with setting 0. The parameter backup is to be stored on the memory card with setting 22. p0802 = 22 (parameter backup stored on memory card as target with setting 22) p0803 = 0 (parameter backup stored in device memory as source with setting 0) p0804 = 2 (start data transfer from device memory to memory card) --> PS000xxx.ACX is transferred from device memory to memory card and stored as PS022xxx.ACX. --> the parameter backup PS022xxx.ACX on the memory card can be used for data backup.</p> <p>Example 2: The parameter backup is to be transferred from the memory card to the non-volatile device memory with setting 22. The parameter backup is to be stored in the device memory as setting 10. p0802 = 22 (parameter backup stored on memory card as source with setting 22) p0803 = 10 (define parameter backup with setting 10 as target in the device memory) p0804 = 1 (start data transfer from memory card to device memory) --> PS022xxx.ACX is transferred from memory card to device memory and stored as PS010xxx.ACX. --> this parameter backup can be loaded to the volatile device memory using p0010 = 30 and p0970 = 10. --> to permanently save in the device memory and also on the memory card, this parameter backup should be saved using p0971 = 1.</p> <p>Example 3 (only supported for PROFIBUS/PROFINET): The PROFIBUS or PROFINET device master data (GSD) should be transferred from the device memory to the memory card. p0802 = (not relevant) p0803 = (not relevant) p0804 = 12 (start transferring the GSD files to the memory card) --> The GSD files are transferred from the device memory to the memory card and stored in the /SIEMENS/SINAMICS/DATA/CFG directory.</p> | | |
| Value: | <p>0: Inactive 1: Memory card to device memory 2: Device memory to memory card 12: Device memory (GSD files) to memory card 1001: File on memory card cannot be opened 1002: File in device memory cannot be opened 1003: Memory card not found 1100: File cannot be transferred</p> | | |
| Recommendation: | <p>When switching off/switching on, a possibly valid parameter backup is loaded to the memory card with setting 0. Therefore, we do not recommend parameter backup with setting 0 (p0803 = 0) in the non-volatile device memory.</p> | | |
| Dependency: | <p>See also: p0802, p0803</p> | | |
| Notice: | <p>The memory card must not be removed while data is being transferred.</p> | | |

Note: If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.
 When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").
 Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:
 p0804 = 1001:
 The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.
 p0804 = 1002:
 The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.
 p0804 = 1003:
 No memory card has been inserted.
 p0804 = 1100:
 It is not possible to transfer at least one file.

Dependency: See also: p0806
Notice: The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.
Note: Bit 0 = 0: BICO interconnection active
 Bit 0 = 1: Master control for PC/AOP
 The commissioning software (drive control panel) uses the master control, for example.

Description: Copies one Command Data Set (CDS) into another.
Index: [0] = Source Command Data Set
 [1] = Target Command Data Set
 [2] = Start copying procedure

2 Parameters

2.2 List of parameters

Dependency: See also: r3996

Notice: When the command data sets are copied, short-term communication interruptions may occur.

Note: When copying a command data set (CDS), the values in p0700, p1000 and p1500 are not accepted. As a consequence, the associated macros are not executed and inconsistencies are avoided.

Procedure:

1. In Index 0, enter which command data set should be copied.
2. In index 1, enter the command data set that is to be copied into.
3. Start copying: set index 2 from 0 to 1.

p0809[2] is automatically set to 0 when copying is completed.

If the motor is also switched with the drive data set, different motor numbers must be used. In this case, the data set can only be switched when the pulse inhibit is set. | | |

2 Parameters

2.2 List of parameters

Note: If the motor numbers are identical, the same thermal motor model is used for calculation after data set changeover. If different motor numbers are used, different models are also used for calculating (the inactive motor cools down in each case).
For the same motor number, the correction values of the Rs, Lh or kT adaptation are applied for the data set changeover (refer to r1782, r1787, r1797).

For bit 04:
A data set changeover is only carried out when the armature short circuit is not activated.
For bit 05:
A data set changeover is only carried out when pole position identification is not running.
For bit 07:
A data set changeover is only carried out when rotating measurement is not running.
For bit 08:
A data set changeover is only carried out when motor data identification is not running.

| | | | [1] 0 |
| | | | [2] 0 |
| | | | [3] 0 |

Description: Sets the signal source for the command "ON/OFF (OFF1)".

For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0).

Recommendation: When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.

Dependency: See also: p1055, p1056

Caution: When "master control from PC" is activated, this binector input is ineffective.

Notice: For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056.
 The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056.

For binector input p0840 = 0 signal, the switching on inhibited is acknowledged.

Only the signal source that originally switched on can also switch off again.

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: For drives with closed-loop speed control (p1300 = 20, 21), the following applies:

- BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse cancellation)

For drives with closed-loop torque control (p1300 = 22, 23), the following applies:

- BI: p0840 = 0 signal: immediate pulse cancellation

For drives with closed-loop torque control (activated using p1501), the following applies:

- BI: p0840 = 0 signal: No dedicated braking response, but pulse cancellation when standstill is detected (p1226, p1227)

For drives with closed-loop speed/torque control, the following applies:

- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

For active infeeds (Active Line Module and Smart Line Module) the following applies:

- BI: p0840 = 0 signal: OFF1 (reduce V_{dc} along the ramp, then pulse cancellation and precharging contactor/line contactor open)

- BI: p0840 = 0/1 signal: ON (precharging contactor/line contactor close, pulses can be enabled)

For passive infeeds (Basic Line Module) the following applies:

- BI: p0840 = 0 signal: OFF1 (precharging contactor/line contactor open)

- BI: p0840 = 0/1 signal: ON (precharging contactor/line contactor close)

r0863.1 of a drive can also be selected as signal source.

Description: Sets the signal source for the command "enable operation/inhibit operation".
 For the PROFIdrive profile, this command corresponds to control word 1 bit 3 (STW1.3).
 BI: p0852 = 0 signal
 Inhibit operation (suppress pulses).
 BI: p0852 = 1 signal
 Enable operation (pulses can be enabled).

Caution: When "master control from PC" is activated, this binector input is ineffective.

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Description: Sets the signal source for the command "control by PLC/no control by PLC".
 For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).
 BI: p0854 = 0 signal
 No control by PLC
 BI: p0854 = 1 signal
 Master control by PLC.

Caution: When "master control from PC" is activated, this binector input is ineffective.

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1.

If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

| | Min: 100.0 [ms] | Max: 60000.0 [ms] | Factory setting: 10000.0 [ms] |
| Description: | Sets the monitoring time for the power unit. The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, fault F07802 is output. | | |
| Dependency: | See also: F07802, F30027 | | |
| Notice: | The maximum time to precharge the DC link is monitored in the power unit and cannot be changed. The maximum precharging duration depends on the power unit. The monitoring time for the precharging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum precharging duration is exceeded. | | |
| Note: | The factory setting for p0857 depends on the power unit. The monitoring time for the ready signal of the power unit includes the time to precharge the DC link and, if relevant, the de-bounce time of the contactors. If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault. | | |

| Dependency: | See also: p0855 | | |
| Note: | The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake). For a 1 signal via BI: p0858, the command "unconditionally close the holding brake" is executed and internally a zero setpoint is entered. | | |

| Recommendation: | When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used. | | |
| Dependency: | See also: p0861, r0863 See also: F07300 | | |
| Notice: | The line contactor monitoring is deactivated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1). | | |
| Note: | The state of the line contactor is monitored depending on signal BO: r0863.1. When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1. | | |

2.2 List of parameters

Note: For bit 00:
After withdrawing the OFF1 enable (source of p0840), the main contactor is opened after the main contactor holding time has elapsed.
For p0869.0 = 1, after withdrawing STO, the switching on inhibited must be acknowledged via the source of p0840 = 0 (OFF1) – and before the main contactor holding time expires (p0867), should go back to 1, otherwise the main contactor will open.

The address can be set as follows:
1) Using the DIP switch on the Control Unit.
--> p0918 can then only be read and displays the selected address.
--> A change only becomes effective after a POWER ON.
2) Using p0918
--> Only if all of the DIP switches are set to ON or OFF.
--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".
--> A change only becomes effective after a POWER ON.

Note: Permissible PROFIBUS addresses: 1 ... 126
Address 126 is used for commissioning.
Every PROFIBUS address change only becomes effective after a POWER ON.

| Unit group: - | Unit selection: - | Function diagram: 8050, 8060 |
| Min: | Max: | Factory setting: |
| - [ms] | - [ms] | - [ms] |

Description: Displays the system runtime in milliseconds when the fault occurred.

Dependency: See also: r0945, r0947, r0949, r2109, r2130, r2133, r2136

Notice: The time comprises r2130 (days) and r0948 (milliseconds).

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

When the parameter is read via PROFIdrive, the TimeDifference data type applies.

Description: Displays the PROFdrive profile number and profile version.
Constant value = 0329 hex.
Byte 1: Profile number = 03 hex = PROFdrive profile
Byte 2: Profile version = 29 hex = Version 4.1

Note: When the parameter is read via PROFdrive, the Octet String 2 data type applies.

Description: Displays the system runtime in ms since the last POWER ON.

Note: The value in p0969 can only be reset to 0.

The value overflows after approx. 49 days.

When the parameter is read via PROFdrive, the TimeDifference data type applies.

| | | | |

| p0970 | Reset drive parameters / Drive par reset | | |
| | Access level: 1 | Calculated: - | Data type: Unsigned16 |
| | Can be changed: C(1, 30) | Scaling: - | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: | Max: | Factory setting: |
| | 0 | 300 | 0 |

Description: The parameter is used to initiate the reset of the drive parameters.

Parameters p0100, p0205 are not reset.

The following motor parameters are defined in accordance with the power unit: p0300 ... p0311.

Value:

- 0: Inactive
- 1: Start a parameter reset
- 3: Start download of volatile parameters from RAM
- 5: Starts a safety parameter reset
- 10: Start loading the parameters saved with p0971=10
- 11: Start loading the parameters saved with p0971=11
- 12: Start loading the parameters saved with p0971=12
- 30: Start loading the delivery state saved with p0971=30
- 100: Start a BICO interconnection reset
- 300: Only Siemens internal

Dependency: See also: F01659

Notice: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: A factory setting run can only be started if p0010 was first set to 30 (parameter reset).
 At the end of the calculations, p0970 is automatically set to 0.
 Parameter reset is completed with p0970 = 0 and r3996[0] = 0.
 For p0970 = 5 the following applies:
 The password for Safety Integrated must be set.
 When Safety Integrated is enabled, this can result in messages, which then require an acceptance test to be performed.
 Then save the parameters and carry out a POWER ON.
 For p0970 = 1 the following applies:
 If a Safety Integrated Function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault (F01659) is output with fault value 2.
 The following generally applies:
 One index of parameters p2100, p2101, p2118, p2119, p2126, p2127 is not reset, if a parameterized message is precisely active in this index.

p0971 Save parameters / Save par

|-----------------------------|--------------------------|------------------------------|
| Access level: 1 | Calculated: - | Data type: Unsigned16 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: | Max: | Factory setting: |
| 0 | 30 | 0 |

Description: Setting to save parameters in the non-volatile memory.
 When saving, only the adjustable parameters intended to be saved are taken into account.

Value:

- 0: Inactive
- 1: Save drive object
- 10: Save in non-volatile memory as setting 10
- 11: Save in non-volatile memory as setting 11
- 12: Save in non-volatile memory as setting 12
- 30: State when delivered, save in non-volatile memory as setting 30

Dependency: See also: p0970, p1960, p3845, r3996

Caution: If a memory card (optional) is inserted – and the USB interface is not used, the following applies:
 The parameters are also saved on the card and therefore overwrite any existing data!

Notice: The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

Writing to parameters is inhibited while saving.
 The progress while saving is displayed in r3996.
 For p0971 = 30:

The original state when delivered is overwritten when executing this memory function.

Note: Parameters saved with p0971 = 10, 11, 12 can be loaded again with p0970 = 10, 11 or 12.
 Identification and maintenance data (I&M data, p8806 and following) are only saved for p0971 = 1.

p0972**Drive unit reset / Drv_unit reset**

| | | |
|-----------------------------|--------------------------|------------------------------|
| Access level: 3 | Calculated: - | Data type: Unsigned16 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0 | Max: 3 | Factory setting: 0 |

Description:

Sets the required procedure to execute a hardware reset for the drive unit.

Value:

0: Inactive
 1: Hardware-Reset immediate
 2: Hardware reset preparation
 3: Hardware reset after cyclic communication has failed

Danger:

It must be absolutely ensured that the system is in a safe condition.

The memory card/device memory of the Control Unit must not be accessed.

Note:

For value = 1:

Reset is immediately executed and communications interrupted.

After communications have been established, check the reset operation (refer below).

If value = 2:

Help to check the reset operation.

Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.

After communications have been established, check the reset operation (refer below).

If value = 3:

The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.

If cyclic communication is not active, then the reset is immediately executed.

After communications have been established, check the reset operation (refer below).

To check the reset operation:

After the drive unit has been restarted and communications have been established, read p0972 and check the following:

p0972 = 0? --> the reset was successfully executed.

p0972 = 0? --> the reset was not executed.

2 Parameters

2.2 List of parameters

Dependency: Selects the required fixed speed setpoint using p1020 ... p1023.
Displays the number of the actual fixed speed setpoint in r1197.
Sets the values for the fixed speed setpoints 1 ... 15 using p1001 ... p1015.
See also: p1020, p1021, p1022, r1197

Note: If a fixed speed setpoint has not been selected (p1020 ... p1023 = 0, r1197 = 0), then r1024 = 0 (setpoint = 0).

| Min: - [rpm] | Max: - [rpm] | Factory setting: - [rpm] |

Description: Display and connector output for the selected and active fixed speed setpoint.
This setpoint is the output value for the fixed speed setpoints and must be appropriately interconnected (e.g. with the main setpoint).

Recommendation: Interconnect the signal with the main setpoint (CI: p1070 = r1024).

Dependency: Selects the required fixed speed setpoint using p1020 ... p1023.
Displays the number of the actual fixed speed setpoint in r1197.
Sets the values for the fixed speed setpoints 1 ... 15 using p1001 ... p1015.
See also: p1070, r1197

Note: If a fixed speed setpoint has not been selected (p1020 ... p1023 = 0, r1197 = 0), then r1024 = 0 (setpoint = 0).

| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: - | Max: - | Factory setting: - |

Description: Display and binector output for the status when selecting the fixed speed setpoints.

Bit array:

| Bit | Signal name | 1 signal | 0 signal | FP |
|-----|-------------------------------|----------|----------|------|
| 00 | Fixed speed setpoint selected | Yes | No | 3011 |

Dependency: See also: p1016

Note: For bit 00:
When the fixed speed setpoints are directly selected (p1016 = 1), this bit is set if at least 1 fixed speed setpoint is selected.

p1030[0...n] **Motorized potentiometer configuration / Mop configuration**

| | | |
|-----------------------------|--------------------------|--|
| Access level: 3 | Calculated: - | Data type: Unsigned16 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 3020 |
| Min: - | Max: - | Factory setting: 0000 0110 bin |

Description: Sets the configuration for the motorized potentiometer.

Bit array:

| Bit | Signal name | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00 | Data save active | Yes | No | - |
| 01 | Automatic mode ramp-function generator active | Yes | No | - |
| 02 | Initial rounding-off active | Yes | No | - |
| 03 | Save in NVRAM active | Yes | No | - |
| 04 | Ramp-function generator always active | Yes | No | - |

Note:

For bit 00:
 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.
 1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

For bit 01:
 0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).
 1: With ramp-function generator in the automatic mode.

For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

For bit 02:
 0: Without initial rounding-off
 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).

The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:

$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$

The jerk acts up until the maximum acceleration is reached ($a_{max} = p1082 [1/s] / p1047 [s]$), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

For bit 03:
 0: Non-volatile data save deactivated.
 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

For bit 04:
 When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00 [ms] | Max: 127.00 [ms] | Factory setting: 0.00 [ms] |
| Description: | Sets the time with which new speed setpoints are interpolated. With interpolation, the higher-level control adapts the speed setpoint steps to the time grid of the setpoint channel. | | |
| Recommendation: | For non-synchronous operation, a setting to the maximum time difference between two setpoints is recommended. For sensorless vector control, interpolation should always be activated if the ramp-up and ramp-down times of the ramp-function generator are very short. The drive must be able to follow the external speed setpoint (the drive does not ramp up at the torque limit). | | |
| Note: | For acceleration precontrol of the speed controller, interpolation prevents torque peaks from occurring if the ramp-up or ramp-down times in the setpoint channel are zero. When exiting commissioning, the parameter is preset using the automatic calculation if, as setpoint source for the main or supplementary setpoint, a PZD receive word is already set and the ramp-up time is zero. Interpolation is limited to 127 cycles of the setpoint channel. p1079 = 0 ms: interpolation is deactivated. p1079 = 0.01 ms: the interpolation is automatically determined the first time that the speed setpoint is changed. After this, no other changes are made if the send times of the external control increase. Writing to p1079 again initiates the automatic adaptation of the interpolation time. p1079 > 0.01 ms: interpolation is performed corresponding to the ratio to the computation clock cycle. | | |

2 Parameters

2.2 List of parameters

Note: The parameter value applies for both motor directions.
In exceptional cases, the motor can operate below this value (e.g. when reversing).
In order that a stationary motor operates at its minimum speed after all enable signals have been set, the direction must be specified using one of the following preconditions.
- Direction input via small setpoint.
- Direction input by inhibiting the negative or positive direction (p1110, p1111).

| p1082[0...n] | Maximum speed / n_max | | |
| | Access level: 1 | Calculated: p0340 = 1 | Data type: FloatingPoint32 |
| | Can be changed: C(1), T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: 3_1 | Unit selection: p0505 | Function diagram: 3020, 3050, 3060, 3070 |
| | Min: 0.000 [rpm] | Max: 210000.000 [rpm] | Factory setting: 1500.000 [rpm] |
| Description: | Sets the highest possible speed. Example: Induction motor p0310 = 50 / 60 Hz without output filter and Blocksize power unit p1082 <= 60 x 240 Hz / r0313 (vector control) p1082 <= 60 x 550 Hz / r0313 (U/f control) | | |
| Dependency: | For vector control, the maximum speed is restricted to 60.0 / (8.333 x 500 µs x r0313). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over. If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance. For reactors and dU/dt filters, it is limited to 120 Hz / r0313. See also: p0230, r0313, p0322 | | |
| Notice: | After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. | | |

Note: The parameter applies for both motor directions.
 The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).
 The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0310, p0311, p0322.
 The following limits are always effective for p1082:
 $p1082 \leq 60 \times \text{minimum} (15 \times r0310, 550 \text{ Hz}) / r0313$
 $p1082 \leq 60 \times \text{maximum power unit pulse frequency} / (k \times r0313)$, with $k = 12$ (vector control), $k = 6.5$ (U/f control)
 During automatic calculation (p0340 = 1, p3900 > 0), the parameter value is assigned the maximum motor speed (p0322). For p0322 = 0 the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors, the synchronous no-load speed is used as the default value (p0310 x 60 / r0313).
 For synchronous motors, the following additionally applies:
 During automatic calculation (p0340, p3900), p1082 is limited to speeds where the EMF does not exceed the DC link voltage.
 p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 > 0, the value is not changed.

For the skip bandwidths, the following hysteresis behavior applies: For a setpoint speed coming from below, the following applies: r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm] For a setpoint speed coming from above, the following applies: r1170 > 620 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 620 [rpm] | | | |

| | Unit group: - | Unit selection: - | Function diagram: 3080 |
| | Min: 0.0 | Max: 50.0 | Factory setting: 0.0 |
| Description: | Sets the ramp-function generator tracking. The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed controller/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit. | | |
| Recommendation: | If at least one speed setpoint filter/velocity setpoint filter is activated (p1414), then the ramp-function generator tracking should be deactivated (p1145 = 0.0). When the speed setpoint filter is activated, the output value of the ramp-function generator can no longer be tracked (corrected) corresponding to the maximum possible drive acceleration. For p1145 = 0.0: This value deactivates the ramp-function generator tracking. For p1145 = 0.0 ... 1.0: Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating. For p1145 > 1.0: The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value. | | |
| Notice: | If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration. Remedy: - deactivate ramp-function generator tracking (p1145 = 0). - increase the ramp-up/ramp-down time (p1120, p1121). | | |
| Note: | In the U/f mode, ramp-function generator tracking is not active. The speed difference is reduced if the integral component of the speed controller is not maintained when the torque limit is reached (p1400.16 = 1). | | |

p1200[0...n] Flying restart operating mode / FlyRest op_mode

| | | |
|-----------------------------|--------------------------|-------------------------------|
| Access level: 2 | Calculated: - | Data type: Integer16 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 6300 |
| Min: | Max: | Factory setting: |
| 0 | 4 | 0 |

Description: Sets the operating mode for flying restart.
The flying restart allows the drive converter to be switched on while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.

Value:
0: Flying restart inactive
1: Flying restart always active (start in setpoint direction)
4: Flying restart always active (start only in setpoint direction)

Dependency: A differentiation is made between flying restart for U/f control and for vector control (p1300).
Flying restart, U/f control: p1202, p1203, r1204
Flying restart, vector control: p1202, p1203, r1205
For synchronous motors, flying restart cannot be activated.
See also: p1201
See also: F07330, F07331

Notice: The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.

Note: For p1200 = 1, 4, the following applies:
 Flying restart is active after faults, OFF1, OFF2, OFF3.
 For p1200 = 1, the following applies:
 The search is made in both directions.
 For p1200 = 4, the following applies:
 The search is only made in the setpoint direction.
 For U/f control (p1300 < 20), the following applies:
 The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.
 If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: | Max: | Factory setting: |
| | 10 [%] | 400 [%] | 100 [%] |

Description: Sets the search current for the "flying restart" function.
 The value is referred to the motor magnetizing current.
Dependency: See also: r0331
Caution: An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

Notice: The following applies for a synchronous reluctance motor:
 The minimum search current is limited (p1202 >= 50 %).

Note: In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the actual search current is set as a function of the frequency based on the voltage setpoints.
 Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).
 The following applies for a synchronous reluctance motor:
 Adjusting the search current only has an effect if a motor data identification run is then performed (see p1909 bit 22).
 It is possible that a value exceeding 100% cannot be reached if the motor rated power is significantly less than that of the power unit.
 If the motor rated power is significantly higher than that of the power unit, then the search current should be increased for the higher speed range.

p1203[0...n] Flying restart search rate factor / FlyRst v_Srch Fact

|-----------------------------|--------------------------|------------------------------------|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 10 [%] | Max: 4000 [%] | Factory setting: 100 [%] |

Description: Sets the factor for the search speed for flying restart.
The value influences the rate at which the output frequency is changed during a flying restart . A higher value results in a longer search time.

Recommendation: For sensorless vector control and motor cables longer than 200 m, set the factor p1203 >= 300 %.

Caution: An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.
For vector control, a value that is too low or too high can cause flying restart to become unstable.

 **Note:** The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart).
With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203).
For the flying restart of a reluctance motor, the minimum search velocity is limited (p1203 >= 50 %).

| Min: 0 | Max: 26 | Factory setting: 0 | |

Description: Sets the automatic restart mode (AR).
The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.

Value:

- 0: Inhibit automatic restart
- 1: Acknowledge all faults without restarting
- 4: Restart after line supply failure w/o additional start attempts
- 6: Restart after fault with additional start attempts
- 14: Restart after line supply failure following man. acknowledgment
- 16: Restart after fault following manual acknowledgment
- 26: Acknowledging all faults and reclosing for an ON command

Recommendation: For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.

Dependency: The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.
When using an Operator Panel in the LOCAL mode, then there is no automatic start.
For p1210 = 14, 16, a manual acknowledgment is required for an automatic restart.

2 Parameters

2.2 List of parameters

Danger:

If the automatic restart is activated ($p1210 > 1$) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic switching-on operation can only be interrupted by withdrawing the ON command.

Notice:

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed.

For $p1210 > 1$, the motor is automatically started.

Note:

For $p1210 = 1$:

Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts.

For $p1210 = 4$:

An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If, for external 24 V power supplies of the Control Unit, additional faults subsequently occur, these are no longer interpreted as line faults and are therefore also not acknowledged.

For $p1210 = 6$:

An automatic restart is carried out if any fault has occurred.

For $p1210 = 14$:

as for $p1210 = 4$. However, active faults must be manually acknowledged.

For $p1210 = 16$:

as for $p1210 = 6$. However, active faults must be manually acknowledged.

For $p1210 = 26$:

as for $p1210 = 6$. For this mode, the switch-on command can be entered with a delay. The restart is interrupted with either OFF2 or OFF3. Alarm A07321 is only displayed if the cause of the fault has been removed and the drive is restarted by setting the switch-on command.

Dependency:

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

See also: p1210, r1214

See also: F07320

Notice:

After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.

After a complete power failure (blackout) the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time $p1212 / 2$, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.

Note:

A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized ($r0056.4 = 1$) and an additional delay time of 1 s has expired.

As long as a fault is present, an acknowledge command is generated in the time intervals of $p1212 / 2$. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgment starts again from the beginning.

Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.

At least one start attempt is always carried out.

After a line supply failure, acknowledgment is immediate and when the line supply returns, the system is switched on. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgment also causes the start counter to be decremented.

For $p1210 = 26$:

The start counter is decremented if after a successful fault acknowledgment, the on command is present.

| Note: | For index [0]: The monitoring time starts when the faults are detected. If the automatic acknowledgments are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is deactivated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time. For index [1]: The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgment without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the switch-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed. For p1210 = 26, the monitoring time p1213[0] only elapses if there is an active switch-on command. | | |

| Caution: | For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake. | | |
|  | | | |
| Notice: | If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are cancelled, the brake is closed even if the motor is still rotating. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855. | | |
| Note: | If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3. if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal. | Recommendation: | This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied. | | |
| Dependency: | See also: p1215, p1217 | | |
| Note: | For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor. | | |

| | Unit group: - | Unit selection: - | Function diagram: 2701 |
| | Min: 0 [ms] | Max: 10000 [ms] | Factory setting: 100 [ms] |
| Description: | Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires. | | |
| Recommendation: | This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed. | | |
| Dependency: | See also: p1215, p1216 | | |
| Notice: | If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime. | | |
| Note: | For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor. | | |

p1226[0...n] Threshold for zero speed detection / n_standst n_thresh

| | | |

| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: 3_1 | Unit selection: p0505 | Function diagram: 2701, 8022 |
| Min: 0.00 [rpm] | Max: 210000.00 [rpm] | Factory setting: 20.00 [rpm] |

Description: Sets the speed threshold for the standstill identification.
Acts on the actual value and setpoint monitoring.
When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.

Dependency: See also: p1227

Caution: For closed-loop speed and torque control without encoder, the following applies:
If p1226 is set to values under approx. 1 % of the rated motor speed, then the model switchover limits of the vector control must be increased in order to guarantee reliable shutdown (see p1755, p1750.7).

 **Note:** Standstill is identified in the following cases:
- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.
The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.

p1227 Zero speed detection monitoring time / n_standst t_monit

| | | |
|-----------------------------|----------------------------|--|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 2701 |
| Min: 0.000 [s] | Max: 300.000 [s] | Factory setting: 300.000 [s] |

Description: Sets the monitoring time for the standstill identification.
When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).

Dependency: The parameter is pre-assigned depending on the size of the power unit.
See also: p1226

Notice: For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not cancelled.

Note: Standstill is identified in the following cases:
- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.
For p1227 = 300.000 s the following applies:
Monitoring is deactivated.
For p1227 = 0.000 s, the following applies:
With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.
The parameters are preassigned according to the specific power unit once the Control Unit has been powered up for the first time or when the factory settings have been restored.

| Min: 0.000 [s] | Max: 299.000 [s] | Factory setting: 0.010 [s] |

Description: Sets the delay time for pulse cancellation.
After OFF1 or OFF3, the pulses are canceled, if at least one of the following conditions is fulfilled:
- the speed actual value falls below the threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the threshold in p1226 and the time started after this in p1227 has expired.

Dependency: See also: p1226, p1227

Notice: When the motor holding brake is activated, pulse cancellation is additionally delayed by the brake closing time (p1217).

| Dependency: | See also: p0300, p1232, p1233, p1234, r1239 | | |
| Note: | The function can only be used for induction motors (p0300 = 1). For p1231 = 4: The function is activated as soon as the activation criterion is fulfilled. - the function can be superseded by an OFF2 response. Activation criterion (one of the following criteria is fulfilled): - binector input p1230 = 1 signal (DC braking activation, depending on the operating mode). - the drive is not in the state "S4: Operation" or in "S5x". - the internal pulse enable is missing (r0046.19 = 0). DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101. In order that DC braking is active as fault response, the corresponding fault number must be entered in p2100 and fault response p2101 set = 6. For p1231 = 5: DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely (the system waits for demagnetization). Flying restart must be activated if the motor is still rotating. DC braking by means of fault response continues to be possible. For p1231 = 14: In addition to the function for p1231 = 5, binector input p1230 is evaluated. DC braking is only automatically activated when the speed threshold p1234 is fallen below if binector input p1230 = 1 signal. This is also the case, if no OFF command is present. After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3). If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed. Note: DCBRK: DC Braking | | |

| Note: | A change to the braking current becomes effective the next time that DC braking is switched on. The value for p1232 is specified as an rms value in the 3-phase system. The magnitude of the braking current is the same as that of an identical output current at frequency zero (see r0067, r0068, p0640). The braking current is internally limited to r0067. | Dependency: | See also: p1230, p1231, p1232, p1233, r1239 | | |
| Notice: | If an encoder fault occurs during closed-loop operation with an encoder, controlled deceleration of the drive down to the start speed p1234 is no longer possible. In this case, DC braking is activated immediately and injects the braking current p1232 for the braking time p1233 after de-magnetizing. The braking current and braking duration must, therefore, be dimensioned accordingly for this situation so that the drive can be decelerated to standstill. In the case of operation with an encoder, this speed may not be set too low so as ensure that the oscillation movement induced by the residual flux/remanence of the motor does not cause DC braking to be deactivated again. | | |
| Note: | Function p1231 = 14 is activated at 15 1/min higher than the value set in p1234. This hysteresis is required to prevent DC braking from being deactivated for speed encoder signals with ripple. | | |

| Dependency: | Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400). Operation with speed controller is not possible for permanent-magnet synchronous motors. See also: p0300, p0311, p0400, p1501 |
| Notice: | Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition. |
| Note: | The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3. |

| | Min: 0.0 [%] | Max: 250.0 [%] | Factory setting: 50.0 [%] |
| Description: | <p>Defines the voltage boost as a [%] referred to the rated motor current (p0305). The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present. The magnitude of the boost in Volt at a frequency of zero is defined as follows: Voltage boost [V] = 1.732 x p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1310 (permanent voltage boost [%]) / 100 % At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:</p> <ul style="list-style-type: none"> - magnetize the induction motor. - hold the load. - compensate for losses in the system. <p>This is the reason that the output voltage can be increased using p1310. The voltage boost can be used for both linear as well as square-law U/f characteristics.</p> | | |
| Dependency: | <p>The starting current (voltage boost) is limited by the current limit p0640. The accuracy of the starting current depends on the setting of the stator and feeder cable resistance (p0350, p0352). For vector control, the starting current is realized using p1610. See also: p1300, p1311, p1312, r1315</p> | | |
| Notice: | The starting current (voltage boost) increases the motor temperature (particularly at zero speed). | | |
| Note: | <p>The starting current as a result of the voltage boost is only effective for U/f control (p1300). The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)). However, these parameters are assigned the following priorities: p1310 > p1311, p1312 For field orientation (p1302.4 = 1, not PM230, PM250, PM260), p1311 and p1312 of the voltage boost is also added in the direction of the load current (non linear).</p> | | |

2 Parameters

2.2 List of parameters

Dependency: Selects the freely programmable characteristic using p1300 = 3.
The following applies for the frequency values:
p1320 <= p1322 <= p1324 <= p1326
Otherwise, a standard characteristic is used that contains the rated motor operating point.
See also: p1310, p1311, p1320, p1321, p1322, p1323, p1324, p1325, p1327

Note: Linear interpolation is carried out between the points 0 Hz/p1310, p1320/p1321 ... p1326/p1327. For output frequencies above p1326, the characteristic is extrapolated with the gradient between the characteristic points p1324/p1325 and p1326/p1327.
The voltage boost when accelerating (p1311) is also applied to the freely programmable U/f characteristic.

p1327[0...n] U/f control programmable characteristic voltage 4 / Uf char U4

| | | |
|-----------------------------|--------------------------------|---------------------------------------|
| Access level: 3 | Calculated: p0340 = 1,3 | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 6301 |
| Min: 0.0 [Vrms] | Max: 10000.0 [Vrms] | Factory setting: 0.0 [Vrms] |

Description: The programmable characteristic for the U/f control is defined using 4 points and 0 Hz/p1310.

This parameter specifies the voltage of the fourth point along the characteristic.

Dependency: Selects the freely programmable characteristic using p1300 = 3.
See also: p1310, p1311, p1320, p1321, p1322, p1323, p1324, p1325, p1326

Note: Linear interpolation is carried out between the points 0 Hz/p1310, p1320/p1321 ... p1326/p1327.
The voltage boost when accelerating (p1311) is also applied to the freely programmable U/f characteristic.

p1330[0...n] CI: U/f control independent voltage setpoint / Uf U_set independ.

| | | |
|--------------------------|--------------------------|---|
| Access level: 3 | Calculated: - | Data type: U32 / FloatingPoint32 |

| Unit group: - | Unit selection: - | Function diagram: 6301 |
| Min: - | Max: - | Factory setting: 0 |

Description: Sets the signal source for the voltage setpoint for U/f control with an independent voltage setpoint (p1300 = 19).

Dependency: Selects the U/f control with independent voltage setpoint via p1300 = 19.
See also: p1300

p1331[0...n] Voltage limiting / U_lim

| | | |
|-----------------------------|-------------------------------|---|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: 5_1 | Unit selection: p0505 | Function diagram: 6300 |
| Min: 50.00 [Vrms] | Max: 2000.00 [Vrms] | Factory setting: 1000.00 [Vrms] |

Description: Limiting the voltage setpoint.

This means that the output voltage can be reduced with respect to the calculated maximum voltage r0071 and the start of field weakening.

Note: The output voltage is only limited if, as a result of p1331, the maximum output voltage (r0071) is fallen below.

p1333[0...n] U/f control FCC starting frequency / U/f FCC f_start

| | | |
|-----------------------------|------------------------------|--------------------------------------|
| Access level: 3 | Calculated: p0340 = 1 | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| Unit group: - | Unit selection: - | Function diagram: 6301 |
| Min: 0.00 [Hz] | Max: 3000.00 [Hz] | Factory setting: 0.00 [Hz] |

Description: Sets the starting frequency at which FCC (Flux Current Control) is activated.

Dependency: The correct operating mode must be set (p1300 = 1, 6).

Alarm: An excessively low value can result in instability.

Note: For p1333 = 0 Hz, the FCC starting frequency is automatically set to 6 % of the rated motor frequency.

| Unit group: - | Unit selection: - | Function diagram: 6310 | |
| Min: 0.00 [Hz] | Max: 3000.00 [Hz] | Factory setting: 0.00 [Hz] | |

Description: Sets the starting frequency of the slip compensation.

Note: For p1334 = 0, the starting frequency of the slip compensation is automatically set to 6 % of the rated motor frequency.

| | | | |
|-----------------------------|---|-------------------------------------|--|
| p1335[0...n] | Slip compensation scaling / Slip comp scal | | |
| Access level: 3 | Calculated: p0340 = 1 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 6300, 6310 | |
| Min: 0.0 [%] | Max: 600.0 [%] | Factory setting: 0.0 [%] | |

Description: Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip).

p1335 = 0.0 %: Slip compensation deactivated.

p1335 = 100.0 %: The slip is completely compensated.

Dependency: Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360).

If the parameters are not precisely known, a precise compensation can be achieved by varying p1335.

For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.

Note: The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors.

For synchronous motors, this effect does not occur and the parameter has no effect in this case.

For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency.

If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

| p1338[0...n] | U/f mode resonance damping gain / Uf Res_damp gain | | |
| Access level: 3 | Calculated: p0340 = 1,3,4 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 6300, 6310 | |
| Min: 0.00 | Max: 100.00 | Factory setting: 0.00 | |
| Description: | Sets the gain for resonance damping for U/f control. | | |
| Dependency: | See also: p1300, p1339, p1349 | | |
| Note: | The resonance damping function dampens active current oscillations that frequency occur under no-load conditions. The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349. For the open-loop control modes p1300 = 5 and 6 (textile sectors), the resonance damping is internally disabled in order that the output frequency can be precisely set. | | |
| p1339[0...n] | U/f mode resonance damping filter time constant / Uf Res_damp T | | |
| Access level: 4 | Calculated: p0340 = 1,3,4 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 6310 | |
| Min: 1.00 [ms] | Max: 1000.00 [ms] | Factory setting: 20.00 [ms] | |
| Description: | Sets the filter time constant for resonance damping for U/f control. | | |
| Dependency: | See also: p1300, p1338, p1349 | | |
| p1340[0...n] | I_max frequency controller proportional gain / I_max_ctrl Kp | | |
| Access level: 3 | Calculated: p0340 = 1,3,4 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 6300 | |
| Min: 0.000 | Max: 0.500 | Factory setting: 0.000 | |
| Description: | Sets the proportional gain of the I_max frequency controller. The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time). | | |
| Dependency: | In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used. | | |
| Notice: | When deactivating the I_max controller, the following must be carefully observed: When the maximum current (r0067) is exceeded, the output current is no longer reduced. The drive is switched off when the overcurrent limits are exceeded. | | |
| Note: | The I_max limiting controller becomes ineffective if the ramp-function generator is deactivated with p1122 = 1. p1341 = 0: I_max frequency controller deactivated and I_max voltage controller activated over the complete speed range. | | |
| p1341[0...n] | I_max frequency controller integral time / I_max_ctrl Tn | | |
| Access level: 3 | Calculated: p0340 = 1,3,4 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 6300 | |
| Min: 0.000 [s] | Max: 50.000 [s] | Factory setting: 0.300 [s] | |
| Description: | Sets the integral time for the I_max frequency controller. | | |
| Dependency: | See also: p1340 | | |

Note: When p1341 = 0, the current limiting controller influencing the frequency is deactivated and only the current limiting controller influencing the output voltage remains active (p1345, p1346).
In the case of power units with regenerative feedback (PM250, PM260), current limitation control for a regenerative load is always implemented by influencing the frequency. This current limiting function is deactivated with p1340 = p1341 = 0.

| Unit group: - | Unit selection: - | Function diagram: 6310 | |
| Min: 0.00 [Hz] | Max: 3000.00 [Hz] | Factory setting: 0.00 [Hz] | |

Description: Sets the maximum output frequency for resonance damping for U/f control.
Resonance damping is inactive above this output frequency.

Dependency: See also: p1338, p1339

Note: For p1349 = 0, the changeover limit is automatically set to 95 % of the rated motor frequency - however, to a max. of 45 Hz.

| Unit group: - | Unit selection: - | Function diagram: 6300 | |
| Min: 0 | Max: 1 | Factory setting: 0 | |

Description: Sets whether the voltage is continuously increased during the magnetizing phase (p1350 = 1, On) or whether it jumps directly to the voltage boost (p1350 = 0, Off).

Value:
0: OFF
1: ON

Note: The settings for this parameter have the following advantages and disadvantages:

0 = off (jump directly to voltage boost)

Advantage: Flux is established quickly -> torque is quickly available

Disadvantage: The motor can move while it is being magnetized

1 = on (voltage is continually established)

Advantage: The motor is unlikely to rotate

Disadvantage: The flux is established slower -> torque is available later

Description: Sets the frequency setting value at the slip compensation output for starting up with motor holding brake.

Dependency: When setting p1351 > 0, then slip compensation is automatically activated (p1335 = 100 %).

See also: p1302, p1352

Notice: A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

Note: Connected with p1352 a value of 100% corresponds to the motor rated slip (r0330).

Description: Sets the signal source for the frequency setting value at the slip compensation output for starting up with motor holding brake.

Dependency: See also: p1216

Note: A value of 100% corresponds to the motor rated slip (r0330).
The setting of the starting frequency begins after magnetizing (see p0346, r0056.4) and ends once the brake opening time (p1216) has elapsed and the starting frequency (p1334) has been reached.
A setting value of zero means that no setting procedure will take place.

| | 25 | Acceleration torque instantaneous in the I/f mode | Yes | No | - |

Note: For bit 01:
When the bit is set, the I component of the speed controller is kept when changing into the open-loop controlled mode.
For bit 16:
When the bit is set, the integral component of the speed controller is only held if it reaches the torque limit.
For bit 20:
The acceleration model for the speed setpoint is only active for sensorless vector control if p1496 is not zero.
For bit 25:
When the bit is set, for high dynamic starting in the I/f mode, the acceleration precontrol torque smoothing only has a short minimum time (4 ms).

2 Parameters

2.2 List of parameters

Note: For bit 00 (not for permanent-magnet synchronous motors):
Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.

For bit 01 (not for permanent-magnet synchronous motors):
Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. When quick magnetizing (p1401.6 = 1) is selected, soft starting is internally deactivated and alarm A07416 is displayed.
The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.

For bit 02 (not for permanent-magnet synchronous motors):
The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.

For bit 03:
Synchronous reluctance motor (RESM):
Activation of the load-dependent optimum flux characteristic.

For bit 06 (not for induction motors):
Magnetizing is performed with maximum current (0.9 * r0067). With active identification of the stator resistance (see p0621) quick magnetizing is internally deactivated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.

For bit 07:
if the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

For bit 09:
Synchronous reluctance motor (RESM):
Dynamic increase in the flux setpoint when torque is quickly established.

For bit 10:
Synchronous reluctance motor (RESM):
For load-dependent optimum flux characteristic (p1401.3 = 1) the flux setpoint is increased at low speeds.
Flux boost at low speeds is only active for operation without encoder.

For bit 14:
When the function is activated, the following applies:
- the optimum flux is calculated and the power loss is entered for optimization purposes
- the efficiency optimization (p1580) is not active.
It only makes sense to activate this function if the dynamic response requirements of the speed controller are low.
In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp). Further, the smoothing time of the flux setpoint filter (p1582) should be increased.

Note:

For bit 00 (not for permanent-magnet synchronous motors):

For load-dependent optimum flux characteristic (p1401.3 = 1) the flux setpoint is increased at low speeds.

Flux boost at low speeds is only active for operation without encoder.

| | Min: - | Max: - | Factory setting: 0 |
| Description: | Sets the signal source for the torque setting value when starting up with motor holding brake. | | |
| Recommendation: | To hold the actual torque when stopping the motor, you are advised to set p1400 bit 1 = 1. As a result, the integral component of the speed controller is frozen when changing to the open-loop controlled operating range. | | |
| Dependency: | The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478. | | |
| Note: | The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056 bit 4) and ends at the end of the brake control opening time p1216. A setting value of zero means that no setting procedure will take place. If p1351 is used as a signal source for the torque setting value, the percentage value is interpreted in relation to the rated torque (p2003). | | |

2 Parameters

2.2 List of parameters

Dependency: The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479. If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not deactivated up to the next time that the pulses are inhibited. For sensorless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero.

In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely precontrolled (e.g. p1496).

If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0).

| | Unit group: - | Unit selection: - | Function diagram: 6030 |
| | Min: 0 | Max: 3 | Factory setting: 0 |
| Description: | Sets the source for droop feedback. With increasing torque, the speed setpoint is reduced (enabled using p1492), so that for mechanically coupled drives a load equalization (load compensation) is obtained. A load difference compensation is also possible, if p1486 is interconnected with the torque setpoint of the other drive. | | |
| Value: | 0: Droop feedback not connected 1: Droop from torque setpoint 2: Droop from speed controller output 3: Droop from integral output speed controller | | |
| Dependency: | See also: p1486, p1487, p1489, r1490, p1492 | | |
| Caution: | For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque. | | |

| Description: | Sets the scaling for the acceleration precontrol of the speed/velocity controller. | | |
| Dependency: | See also: p0341, p0342 | | |
| Alarm: | The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0). The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15). | | |
|  | | | |
| Note: | The parameter is set to 100% by the rotating measurement (refer to p1960). The acceleration precontrol may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled. We also recommend that the precontrol mode is not used if there is gearbox backlash. | | |

| Min: -1000000.00 [Nm] | Max: 20000000.00 [Nm] | Factory setting: 0.00 [Nm] | |

Description: Sets the fixed, upper torque limit.

Dependency: See also: p1521, p1522, p1523, r1538, r1539

Danger: Negative values when setting the upper torque limit (p1520 < 0) can result in the motor accelerating in an uncontrollable fashion.

Notice: A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

Note: The torque limit is limited to 400% of the rated motor torque. When automatically calculating the motor/closed-loop control parameters (p0340), the torque limit is set to match the current limit (p0640).

| Min: -20000000.00 [Nm] | Max: 1000000.00 [Nm] | Factory setting: 0.00 [Nm] | |

Description: Sets the fixed, lower torque limit.

Dependency: See also: p1520, p1522, p1523

Danger: Positive values when setting the lower torque limit (p1521 > 0) can result in the motor accelerating in an uncontrollable fashion.

Notice: A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

Note: The torque limit is limited to 400% of the rated motor torque. When automatically calculating the motor/closed-loop control parameters (p0340), the torque limit is set to match the current limit (p0640).

| Description: | Sets the threshold for the accelerating torque for the moment of inertia estimator. The moment of inertia estimator is active above this threshold. The value is referred to the rated torque (r0333). | | |
| Dependency: | See also: p1400, p1561, p1562 | | |
| Note: | The moment of inertia estimation is inaccurate at very low accelerating torques. As a consequence, below this threshold, the estimator does not provide any new values. | | |

| Description: | Sets a dynamic voltage reserve. | | |
| Dependency: | See also: p0500 | | |
| Note: | In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. | Description: | Sets the limit of the voltage target value. In steady-state field weakening operation this corresponds to the required output voltage. The value of 100% refers to p0304. | | |
| Note: | The output voltage is only limited if the maximum output voltage (r0071) minus the voltage reserve (p1574) corresponds to a value higher than p1575. Limiting via p1575 allows the influence of the voltage ripple of the line supply voltage to be eliminated at the operating point. | | |

| | Min: -200.0 [%] | Max: 200.0 [%] | Factory setting: 50.0 [%] |
| Description: | Sets the static torque setpoint for sensorless vector control in the low speed range. This parameter is entered as a percentage referred to the rated motor torque (r0333). For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed. | | |
| Notice: | p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur. | | |
| Note: | For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current, RESM: no-load magnetizing current). For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque. Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors as well as closed-loop controlled reluctance motors. | | |

| Description: | Sets the scaling of the quadrature arm decoupling | | | |
| Note: | This parameter is ineffective for sensorless vector control. In this case, p1727 is always used. If p1726 is set to 0, then the quadrature de-coupling is deactivated. The integral component of the Isd current controller remains effective in the complete speed control range. For the closed-loop control of synchronous motors, this parameter is used to scale the current controller de-coupling. | | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 30 [%] | Max: 150 [%] | Factory setting: 30 [%] |
| Description: | Sets the speed threshold for deactivating the integral component of the Isd controller. The d current controller is only effective as P controller for speeds greater than the threshold value. Instead of the integral component, the quadrature arm decoupling is effective. | | |
| Alarm: | For settings above 80%, the d current controller is active up to the field weakening limit. When operated at the voltage limit, this can result in an unstable behavior. In order to avoid this, the dynamic voltage reserve p1574 should be increased. | | |

| | Unit group: - | Unit selection: - | Function diagram: - | | |
| | Min: - | Max: - | Factory setting: 0000 0000 0000 0000 bin | | |
| Description: | Sets the configuration for the motor model. Bit 0 = 1: Forces open-loop speed-controlled starting (ASM). Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM). Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM). Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM). Bit 6 = 1: If the motor is blocked, sensorless vector control remains speed-controlled (ASM). Bit 7 = 1: Use rugged switchover limits to switchover the model (open-loop/closed-loop controlled) for regenerative operation (ASM). Bit 8 = 1: Open-loop speed controlled operation independent of the speed setpoint (except for OFF3) (ASM). | | | | |
| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
| | 00 | Controlled start | Yes | No | - |
| | 01 | Controlled through 0 Hz | Yes | No | - |
| | 02 | Closed-loop ctrl oper. down to zero freq. for passive loads | Yes | No | - |
| | 03 | Motor model Lh_pre = f(PsiEst) | Yes | No | - |
| | 06 | Closed-/open-loop controlled when motor is blocked | Yes | No | - |
| | 07 | Use rugged changeover limits | Yes | No | - |
| | 08 | Closed-loop controlled until wait time p1758 has expired | Yes | No | - |
| Dependency: | See also: p0500 | | | | |
| Caution: | Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1). | | | | |
|  | | | | | |

Note: Bits 0 ... 2 only have an influence for sensorless vector control, bit 2 is pre-assigned depending on p0500.

For bit 2 = 1:
The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.
This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.
If bit 2 = 1, then bit 3 is automatically set to 1. Manual de-selection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.
When the bit is set, the selection of bits 0 and 1 is ignored.

For bit 2 = 0:
Bit 3 is also automatically deactivated.

For bit 6 = 1:
The following applies for sensorless vector control of induction motors:
For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.
The following applies for sensorless vector control of synchronous motors:
For a blocked motor (see p2175, p2177), the speed ramp-function generator is held in open-loop speed controlled operation, and a switchover is not made into closed-loop controlled operation.

For bit 7 = 1:
The following applies for sensorless vector control of induction motors:
If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount $p1749 * p1755$.
The effective time condition for changing over into open-controlled operation is obtained from the minimum value of p1758 and $0.5 * r0384$.
It is recommended that bit 7 is activated for applications that demand a high torque at low frequencies, and at the same time require low speed gradients..
Adequate parameterization of the current setpoint must be ensured (p1610, p1611).

For bit 8 = 1: no influence on the functionality of bits 0, 1, 2
The following applies for sensorless vector control of induction motors:
Changeover into open-loop speed controlled operation is no longer dependent on the speed setpoint (except for OFF3), but instead is essentially dependent on time condition p1758. As a consequence, a drive can be started or reversed in closed-loop speed controlled operation with setpoints from an external control system, if these briefly lie in the open-loop speed control range.

| 19 | Current feedback in the current model | Active | Inactive | - |
| 20 | Rugged increase of the changeover limits | Active | Inactive | - |
| 21 | Motor blocked (RFG stop) PMSM | No | Yes | - |

Note:

For bit 17:

Displays the enabled status of the rugged model feedback (p1784).

The feedback is used to increase the parameter ruggedness of the motor model and is effective in the operating range of the two-component closed loop current control.

For bit 18:

Displays the status when enabling the differential current feedback in the current model for operation with encoder.

The function is automatically enabled with p1784 > 0 or p1731 > 0. The feedback is used for a rugged change between the current model and complete machine model with active rugged model feedback and combination current.

For bit 19:

Displays the currently active stator circuit feedback in current model operation.

For bit 20:

Displays the currently effective increase of the changeover limits by the value p1749 * p1755.

For bit 21:

For a blocked synchronous motor, the speed ramp-function generator is held in the open-loop speed controlled operating range if the torque setpoint reaches the torque limit and the speed is less than the threshold value in p2175.

Sets the speed to change over the motor model to encoderless operation.

Dependency: See also: p1749, p1756

Notice: The changeover speed represents the steady-state minimum speed up to which the motor model can be used in sensorless steady-state operation.
If the stability is not adequate close to the changeover speed, it may make sense to increase the parameter value. On the other hand, very low changeover speeds can negatively impact the stability.

Note: The changeover speed applies for the changeover between open-loop and closed-loop control mode.

Description: Sets the hysteresis for the changeover speed of the motor model for encoderless operation.

Dependency: See also: p1755

Note: The parameter value refers to p1755.
Extremely small hystereses can have a negative impact on the stability in the changeover speed range, and very high hystereses in the standstill range.

| Min: 100 [ms] | Max: 10000 [ms] | Factory setting: 500 [ms] |

Description: Sets the minimum time for falling below the changeover speed when changing from closed-loop controlled operation to open-loop controlled operation.

Dependency: The wait time has no significance if the setpoint speed before the ramp-function generator lies in the open-loop speed controlled operating range. In this case, the change is made without any delay.
See also: p1755, p1756

Note: If p1758 is changed, commissioning must be selected in order to validate the value for the blocking monitoring.

Description: Sets the minimum time for a transition from open-loop controlled to closed-loop controlled operation after the lower changeover speed $p1755 * (1 - p1756 / 100 \%)$ has been exceeded.

Dependency: See also: p1755, p1756

Note: With $p1759 = 2000$ ms, the delay time becomes ineffective and the model changeover is determined by the output frequency only (changeover for p1755).

Dependency: In U/f characteristic operating mode only bit 7 is relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

Note: ASM: Induction motor

PMSM: permanent-magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

For bit 12 (only for synchronous motors and bit 6 = 1):

The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate.

The duration of the pole position identification is shortened using bit 13. As a consequence, the pole wheel angle error can be slightly greater.

| Description: | Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned. | | |
| Dependency: | Minimum pulse frequency: $p1800 \geq 12 * p1082 * r0313 / 60$ See also: p0230 | | |
| Note: | The maximum and minimum possible pulse frequency is also determined by the power unit being used (minimum pulse frequency: 2 kHz or 4 kHz). When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067). If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter. For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230). If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082). The pulse frequency cannot be changed when the motor data identification is activated. | | |

2 Parameters

2.2 List of parameters

Note: The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for $p1300 < 20$ (U/f controls).
An appropriate alarm is output when the parameter is set.
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.
 $p1900$ is automatically set to 0 after the motor data identification routine has been completed.
If a reluctance motor has been parameterized, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.
For U/f control ($p1300$), identification with speed controller optimization does not make sense (e.g. $p1900 = 1$).

Description:

Sets the configuration for the test pulse evaluation.

Bit 00: Check for conductor-to-conductor short circuit once/always when the pulses are enabled.

Bit 01: Check for ground fault once/always when the pulses are enabled.

Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled

Recommendation:

If the ground fault test is incorrectly initiated because the motor is not at a complete standstill, then the pulse cancellation delay time (p1228) should be increased.

Bit array:

| Bit | Signal name | 1 signal | 0 signal | FP |
|-----|--|----------|----------|----|
| 00 | Phase short-circuit test pulse active | Yes | No | - |
| 01 | Ground fault detection test pulse active | Yes | No | - |
| 02 | Test pulse at each pulse enable | Yes | No | - |

Dependency:

The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is deactivated (p1200 = 0).

See also: p0287

Note:

If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.

If a ground fault is detected during the test, this is displayed in r1902.2.

For bit 02 = 0:

If the test was successful once after POWER ON (see r1902.0), then it is not repeated.

For bit 02 = 1:

The test is not only performed after POWER ON, but also each time the pulses are enabled.

Note: The following applies to permanent-magnet synchronous motors:
 Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current.
 When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current.
 If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.
 Bit 19 = 1:
 All parameters are automatically saved after a successful motor data identification.
 If a speed controller optimization run is then selected, the parameters are only saved after this measurement has been completed.
 Bit 22 = 1:
 Only that measurement is carried out that is required for the flying restart of a reluctance motor. The bit is reset after a successful measurement

| | 04 | Speed controller optimization (vibration test) | Yes | No | - |
| | 11 | Do not change the controller parameters during the measurement | Yes | No | - |

Dependency: See also: F07988

Note: The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).

The following parameters are influenced for the individual optimization steps:

Bit 00: None

Bit 01: p0320, p0360, p0362 ... p0369

Bit 02: p0341, p0342

Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496

Bit 04: Dependent on p1960

Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors

p1960 = 1, 3: p1458, p1459, p1470, p1472, p1496, p1400.0

p1960 = 2, 4: p1458, p1459, p1460, p1462, p1496, p1461, p1463

The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).

Note: When the rotating measurement is activated, it is not possible to save the parameters (p0971).
 Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.
 The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.
 For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472).
 Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.

p1961 **Saturation characteristic speed to determine / Sat_char n determ**

| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 26 [%] | Max: 75 [%] | Factory setting: 40 [%] |

Description: Sets the speed to determine the saturation characteristic.
 The percentage value is referred to p0310 (rated motor frequency).

Dependency: See also: p0310, p1959
 See also: F07983

Note: The saturation characteristics should be determined at an operating point with the lowest possible load.

p1965 **Speed_ctrl_opt speed / n_opt speed**

| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 10 [%] | Max: 75 [%] | Factory setting: 40 [%] |

Description: Sets the speed for the identification of the moment of inertia and the vibration test.
 Induction motor:
 The percentage value is referred to p0310 (rated motor frequency).
 Synchronous motor:
 The percentage value is referred to the minimum from p0310 (rated motor frequency) and p1082 (maximum speed).

Dependency: See also: p0310, p1959
 See also: F07984, F07985

Note: In order to calculate the inertia, sudden speed changes are carried out - the specified value corresponds to the lower speed setpoint. This value is increased by 20 % for the upper speed value.
 The q leakage inductance (refer to p1959.5) is determined at zero speed and at 50 % of p1965 - however, with a maximum output frequency of 15 Hz and at a minimum of 10% of the rated motor speed.

| Min: 1 [%] | Max: 400 [%] | Factory setting: 100 [%] |

Description: Sets the dynamic response factor for speed controller optimization.
 After optimization, the dynamic response achieved is displayed in r1968.

Dependency: See also: p1959, r1968
 See also: F07985

2 Parameters

2.2 List of parameters

Note: For a rotating measurement, this parameter can be used to optimize the speed controller.
p1967 = 100 % --> speed controller optimization according to a symmetric optimum.
p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower).
If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be deactivated and the measurement repeated.

PolID: Pole position identification

| p1999[0...n] | Ang. commutation offset calibr. and PolID scaling / Com_ang_offs scal | | |
|-----------------------------|---|------------------------------------|--|
| Access level: 4 | Calculated: - | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: - | |
| Min: 10 [%] | Max: 5000 [%] | Factory setting: 100 [%] | |

Description: Sets the scaling for the runtime of the pole position identification technique in which the current is injected.

Dependency: See also: p0341, p0342

Caution: For p1999 > 100 % (setting large moments of inertia) the following applies:

There is no locked rotor monitoring (F07970 fault value 2).

Note: For high moments of inertia, it is practical to scale the runtime of the calibration higher.

| p2000 | Reference speed reference frequency / n_ref f_ref | | |
|---------------------------|---|--|--|
| Access level: 2 | Calculated: p0340 = 1 | Data type: FloatingPoint32 | |
| Can be changed: T | Scaling: - | Dyn. index: - | |
| Unit group: - | Unit selection: - | Function diagram: - | |
| Min: 6.00 [rpm] | Max: 210000.00 [rpm] | Factory setting: 1500.00 [rpm] | |

Description: Sets the reference quantity for speed and frequency.
All speeds or frequencies specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)

Dependency: This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.

See also: p2001, p2002, p2003, r2004, r3996

Notice: When the reference speed / reference frequency is changed, short-term communication interruptions may occur.

Note: If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example 1:

The signal of an analog input (e.g. r0755[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

| p2001 | Reference voltage / Reference voltage | | |
| | Access level: 3 | Calculated: p0340 = 1 | Data type: FloatingPoint32 |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 10 [Vrms] | Max: 100000 [Vrms] | Factory setting: 1000 [Vrms] |
| Description: | Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). Note: This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value. | | |
| Dependency: | p2001 is only updated during automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning has been carried out first for drive data set zero and as a result overwriting of the parameter has not been blocked by setting p0573 = 1. See also: r3996 | | |
| Notice: | When the reference voltage is changed, short-term communication interruptions may occur. | | |
| Note: | If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling. | | |

| | | | |
|---------------------|--|---------------------------------|--|
| p2002 | Reference current / I_ref | | |
| | Access level: 3 | Calculated: p0340 = 1 | Data type: FloatingPoint32 |
| | Can be changed: T | Scaling: - | Dyn. index: - |
| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.10 [Arms] | Max: 100000.00 [Arms] | Factory setting: 100.00 [Arms] |
| Description: | Sets the reference quantity for currents. All currents specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). | | |
| Dependency: | This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1. See also: r3996 | | |
| Notice: | If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor must be taken into account. Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 % p0305[0] = 100 A Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current p0305[1] = 50 A Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current When the reference current is changed, short-term communication interruptions may occur. | | |

2 Parameters

2.2 List of parameters

Note: Pre-assigned value is p0640.
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage ($p2002 = r0206 / p0210 / 1.73$) is pre-assigned as the reference quantity.
Example:
The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

| | Min: 0.01 [Nm] | Max: 20000000.00 [Nm] | Factory setting: 1.00 [Nm] |
| Description: | Sets the reference quantity for torque. All torques specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). | | |
| Dependency: | This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1. See also: r3996 | | |
| Notice: | When the reference torque is changed, short-term communication interruptions may occur. | | |
| Note: | Preassigned value is $2 * p0333$. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example: The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling. | | |

 0 2 0

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value: 0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

Description: Sets the signal source for the connector-binector converter.
A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).

Dependency: See also: r2094, r2095

Note: From the signal source set via the connector input, the corresponding lower 16 bits are converted. p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters:
Connector input p2099[0] to binector output in r2094.0...15
Connector input p2099[1] to binector output in r2095.0...15

Description: Selects the faults for which the fault response should be changed

Dependency: The fault is selected and the required response is set under the same index.
See also: p2101

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

p2101[0...19] Change fault response response / Chng resp resp

| | | |
|-----------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Integer16 |

| Unit group: - | Unit selection: - | Function diagram: 8050, 8075 |
| Min: 0 | Max: 7 | Factory setting: 0 |

Description: Sets the fault response for the selected fault.

Value:

- 0: NONE
- 1: OFF1
- 2: OFF2
- 3: OFF3
- 5: STOP2
- 6: Internal armature short-circuit / DC braking
- 7: ENCODER (p0491)

Dependency: The fault is selected and the required response is set under the same index.
See also: p2100

Notice: For the following cases, it is not possible to re-parameterize the fault response to a fault:

- fault number does not exist (exception value = 0).
- Message type is not "fault" (F).
- fault response is not permissible for the set fault number.

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

The fault response can only be changed for faults with the appropriate identification.

Example:
 F12345 and fault response = NONE (OFF1, OFF2)
 --> The fault response NONE can be changed to OFF1 or OFF2.

For value = 1 (OFF1):
 Braking along the ramp-function generator down ramp followed by a pulse inhibit.

For value = 2 (OFF2):
 Internal/external pulse inhibit.

For value = 3 (OFF3):
 Braking along the OFF3 down ramp followed by a pulse inhibit.

For value = 5 (STOP2):
 n_set = 0

For value = 6 (armature short-circuit, internal/DC braking):
 This value can only be set for all drive data sets when p1231 = 4.

a) DC braking is not possible for synchronous motors.
 b) DC braking is possible for induction motors.

For value = 7 (ENCODER (p0491)):
 The fault response set in p0491 is executed if applicable.

Note:
 IASC: Internal Armature Short Circuit
 DCBRK: DC braking

| | 0 | 65535 | 0 |
| Description: | Selects faults or alarms for which the message type should be changed. | | |

Dependency: Selects the fault or alarm selection and sets the required type of message realized under the same index.
See also: p2119

Note: Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.

p2119[0...19] Change message type type / Change type type

| | | |
|-----------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Integer16 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8075 |
| Min: 1 | Max: 3 | Factory setting: 1 |

Description: Sets the message type for the selected fault or alarm.

Value:
1: Fault (F)
2: Alarm (A)
3: No message (N)

Dependency: Selects the fault or alarm selection and sets the required type of message realized under the same index.
See also: p2118

Note: Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.

The message type can only be changed for messages with the appropriate identification (exception, value = 0).

Example:

F12345(A) --> Fault F12345 can be changed to alarm A12345.

In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.

r2120 CO: Sum of fault and alarm buffer changes / Sum buffer changed

| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8065 |
| Min: - | Max: - | Factory setting: - |

Description: This counter is incremented every time the alarm buffer changes.

Dependency: See also: r2110, r2122, r2123, r2124, r2125

r2122[0...63] Alarm code / Alarm code

| | | |
|--------------------------|--------------------------|-------------------------------------|
| Access level: 2 | Calculated: - | Data type: Unsigned16 |
| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8065 |
| Min: - | Max: - | Factory setting: - |

Description: Displays the number of alarms that have occurred.

Dependency: See also: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123

Notice: The properties of the alarm buffer should be taken from the corresponding product documentation.

2 Parameters

2.2 List of parameters

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Alarm buffer structure (general principle):

r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...

r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)

When the alarm buffer is full, the alarms that have gone are entered into the alarm history:

r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...

r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

r2123[0...63]

Alarm time received in milliseconds / t_alarm rcv ms

| | | |
|--------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Unsigned32 |
| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8065 |
| Min: - [ms] | Max: - [ms] | Factory setting: - [ms] |

Description: Displays the system runtime in milliseconds when the alarm occurred.

Dependency: See also: r2110, r2122, r2124, r2125, r2134, r2145, r2146

Notice: The time comprises r2145 (days) and r2123 (milliseconds).

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

r2124[0...63]

Alarm value / Alarm value

| | | |
|--------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Integer32 |
| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8065 |
| Min: - | Max: - | Factory setting: - |

Description: Displays additional information about the active alarm (as integer number).

Dependency: See also: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

r2125[0...63]

Alarm time removed in milliseconds / t_alarm res ms

| | | |
|--------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Unsigned32 |
| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8065 |
| Min: - [ms] | Max: - [ms] | Factory setting: - [ms] |

Description: Displays the system runtime in milliseconds when the alarm was cleared.

Dependency: See also: r2110, r2122, r2123, r2124, r2134, r2145, r2146

Notice: The time comprises r2146 (days) and r2125 (milliseconds).

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

p2126[0...19]

Change acknowledge mode fault number / Chng ackn F_no

| | | |
|-----------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Unsigned16 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8075 |
| Min: 0 | Max: 65535 | Factory setting: 0 |

Description: Selects the faults for which the acknowledge mode is to be changed

Dependency: Selects the faults and sets the required acknowledge mode realized under the same index
See also: p2127

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

p2127[0...19] Change acknowledge mode mode / Chng ackn mode

| | | |
|-----------------------------|--------------------------|-------------------------------------|
| Access level: 3 | Calculated: - | Data type: Integer16 |
| Can be changed: U, T | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8050, 8075 |
| Min: 1 | Max: 2 | Factory setting: 1 |

Description: Sets the acknowledge mode for selected fault.

Value:
1: Acknowledgment only using POWER ON
2: Ack IMMEDIATELY after the fault cause has been removed

Dependency: Selects the faults and sets the required acknowledge mode realized under the same index
See also: p2126

Notice: It is not possible to re-parameterize the acknowledge mode for a fault in the following cases:
- fault number does not exist (exception value = 0).
- Message type is not "fault" (F).
- Acknowledge mode is not permissible for the set fault number.

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

The acknowledge mode can only be changed for faults with the appropriate identification.

Example:

F12345 and acknowledge mode = IMMEDIATELY (POWER ON)

--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

p2128[0...15] Faults/alarms trigger selection / F/A trigger sel

| Can be changed: - | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: 8060 |
| Min: - | Max: - | Factory setting: - |

Description: Displays the system runtime in days when the fault occurred.

Dependency: See also: r0945, r0947, r0948, r0949, r2109, r2133, r2136

Notice: The time comprises r2130 (days) and r0948 (milliseconds).

The value displayed in r2130 refers to January 1, 1970

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

| Note: | For bit 03, 07: These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present" or "alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121). For bit 06, 08: These status bits are used for internal diagnostic purposes only. For bits 11, 12: These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality. | | | |

| Dependency: | See also: r1084, r1087, r2197 | | |
| Notice: | For p0322 = 0, the following applies: $p2162 \leq 0.1 * p0311$ For p0322 > 0, the following applies: $p2162 \leq 1.02 * p0322 - p1082$ If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode. | | |
| Note: | For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082. | | |

2 Parameters

2.2 List of parameters

Dependency: See also: p0500, p2175, r2198

See also: F07900

Note: The following applies for sensorless vector control:

At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly ($p2177 < p1758$) before time p2177 has elapsed in order to detect the locked state reliably.

As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

| | | | |
|-----------------------------|---|--------------------------------------|--|
| p2178[0...n] | Motor stalled delay time / Mot stall t_{del} | | |
| Access level: 3 | Calculated: p0340 = 1,3 | Data type: FloatingPoint32 | |
| Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 | |
| Unit group: - | Unit selection: - | Function diagram: 8012 | |
| Min: 0.000 [s] | Max: 10.000 [s] | Factory setting: 0.010 [s] | |

Description: Sets the delay time for the message "Motor stalled" (BO: r2198.7).

Dependency: See also: r2198

Note: In the open-loop speed controlled operating range (see p1755, p1756), vector control stall monitoring depends on threshold p1745.

At higher speeds, the difference between flux setpoint r0083 and flux actual value r0084 is monitored.

| Can be changed: U, T | Scaling: p2002 | Dyn. index: DDS, p0180 | |
| Unit group: 6_2 | Unit selection: p0505 | Function diagram: 8022 | |
| Min: 0.00 [Arms] | Max: 1000.00 [Arms] | Factory setting: 0.00 [Arms] | |

Description: Sets the current limit for output load identification.

A missing output load is displayed using the "Output load not available" message (r2197.11 = 1).

This message is output with a delay time (p2180).

Dependency: See also: p2180

Notice: For synchronous motors the output current can be almost zero under no load conditions.

Note: Missing output load is signaled in the following cases:

- the motor is not connected.
- a phase failure has occurred.

| Min: 0.00 [rpm] | Max: 210000.00 [rpm] | Factory setting: 150.00 [rpm] |

Description: Sets the speed/torque envelope curve for load monitoring.
The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds:
p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower)
p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower)
p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)

Dependency: The following applies: p2182 < p2183 < p2184
See also: p2183, p2184, p2185, p2186
See also: A07926

Note: In order that the load monitoring can reliably respond, the speed threshold p2182 should always be set lower than the minimum motor speed to be monitored.

| Dependency: | See also: r2231, p2240 | | | | |
| Note: | For bit 00: | | | | |
| | 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240. | | | | |
| | 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1. | | | | |
| | For bit 02: | | | | |
| | 0: Without initial rounding-off | | | | |
| | 1: With initial rounding-off. | | | | |
| | The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237). | | | | |
| | It is calculated as follows: | | | | |
| | $r = 0.0001 \times \max(p2237, p2238) [\%] / 0.13^2 [s^2]$ | | | | |
| | The jerk is effective until the maximum acceleration is reached ($a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration. | | | | |
| | The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time. | | | | |
| | For bit 03: | | | | |
| | 0: Non-volatile data save deactivated. | | | | |
| | 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1). | | | | |
| | For bit 04: | | | | |
| | When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250. | | | | |

| Description: | Sets the configuration of the technology controller. | | | | |
| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
| | 04 | Ramp-up/ramp-down function generator bypass | Deactivated | Activated | - |
| | 05 | Integrator active for skip speeds | Yes | No | - |
| | 06 | Internal controller limit not displayed | Yes | No | - |

Dependency: For bit 04 = 0:
The setting is only effective when the PID controller is deactivated.
See also: p2280, p2285

Caution:

For bit 04 = 1 (p2251 = 0):
The PID controller can oscillate if the ramp-up and ramp-down times of the speed setpoint channel are not taken into account when setting controller parameters p2280 and p2285.

Note:

For bit 04 = 0 (only for p2251 = 0):
The ramp-function generator in the speed setpoint channel is bypassed when the technology controller is operational.
As a consequence, ramp times p1120, p1121 are not taken into consideration when configuring the controller.

For bit 04 = 1 (only for p2251 = 0):
The ramp-function generator in the speed setpoint channel is not bypassed when the technology controller is operational.
As a consequence, the ramp-up and ramp-down times (p1120, p1121) remain effective, and must be taken into account as controlled system variables when setting the PID controller parameters (p2280, p2285).
The enable ramps of the PID controller are ensured in this setting by p1120, p1121 as well as rounding functions p1130 and p1131. The ramp-up/ramp-down time of the PID controller limiting p2293 must be set appropriately shorter, as otherwise this has an impact on the speed setpoint channel.

For bit 05 = 0:
The integral component of the PID controller is held if a skip band or the minimum speed range is passed through in the speed set point channel.
This prevents the speed from oscillating between the edges of the skip band.

For bit 05 = 1:
The setting is only effective if a skip band is no longer active.
The integral component of the PID controller is not held in the range of the skip speeds.
The skip band is passed through even for small system deviations and low controller gain factors. In so doing, the controller integral time must be selected large enough so that no undesirable speed oscillations occur between the skip band edges.
The influence of a minimum speed p1080 on the integration behavior can be reduced by raising the lower PID controller limit to p1080 / p2000 * 100%.

For bit 06 = 1:
In r2349, bit 10 and bit 11 are not displayed when reaching internal limits (e.g. for OFF1/3).

| Caution: | If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate! | | |
|  | | | |
| Note: | The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal of the technology controller. --> If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion). --> If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted). | | |

| Description: | Sets the integral time (I component, integrating time constant) of the technology controller. | | |
| Notice: | The following applies for p2251 = 0: If the output of the technology controller lies within the range of a suppression (skip) bandwidth (p1091 ... p1094, p1101) or below the minimum speed (p1080), the integral component of the controller is held so that the controller temporarily works as a P controller. This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed). | | |
| Note: | When the controller output reaches the limit, the I component of the controller is held. p2285 = 0: The integral time is disabled and the I component of the controller is reset. | | |

| Description: | Sets the signal source for the offset of the output limiting of the technology controller. | | |
| Note: | In mode p2251 = 1, p2299 must be connected to the output of ramp-function generator r1150 so that the technology controller stops when the speed limits are reached (see also p2297, p2298). | | |

| p2302 | | Technology controller output signal starting value / Tec_ctr start val | |

| CU240D-2_DP_F | Unit group: - | Unit selection: - | Function diagram: 7958 |
| CU240D-2_PN_F | Min: 0.00 [%] | Max: 200.00 [%] | Factory setting: 0.00 [%] |
| Description: | Sets the start value for the output of the technology controller. If the drive is switched on and the technology controller is already enabled (see p2200, r0056.3), then its output signal r2294 first goes to the start value p2302, before the controller starts to operate. | | |
| Dependency: | The starting value is only effective in the mode "technology controller as main speed setpoint" (p2251 = 0). If the technology controller is first enabled when the drive is switched on, a start speed remains ineffective, and the controller output starts with the actual setpoint speed of the ramp-function generator. | | |
| Note: | If the technology controller operates on the speed/setpoint channel (p2251 = 0), then the starting value is interpreted as the starting speed and when operation is enabled, is connected to the output of the technology controller (r2294). If fault F07426 "technology controller actual value limited" occurs while ramping up to the starting value and if the associated reaction has been set to "NONE" (see p2100, p2101), the starting value is kept as the speed setpoint instead of a switch to closed-loop control operation. | | |

| CU240D-2_DP | Access level: 3 | Calculated: - | Data type: Integer16 |
| CU240D-2_PN | Can be changed: T | Scaling: - | Dyn. index: - |
| CU240D-2_DP_F | Unit group: - | Unit selection: - | Function diagram: 7958 |
| CU240D-2_PN_F | Min: 0 | Max: 1 | Factory setting: 0 |
| Description: | Setting to invert the system deviation of the technology controller. The setting depends on the type of control loop. | | |
| Value: | 0: No inversion 1: Inversion | | |
| Caution: | If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate! | | |
|  | | | |
| Note: | The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal (of the technology controller). - if the actual value increases with increasing motor speed, then the inversion should be switched out. - if the actual value decreases with increasing motor speed, then the inversion should be set. If value = 0: The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). For value = 1: The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps). | | |

| CU240D-2_PN_F | Min: 0.00 [%] | Max: 200.00 [%] | Factory setting: 2.00 [%] |
| Description: | Sets the threshold value for the system deviation of the technology controller, which controls holding the controller integral component in the range of the skip speeds of the ramp-function generator. | | |
| Recommendation: | To avoid speed setpoint steps in the range of the skip speeds, we recommend setting p2252 bit 4 = 1 (ramp-function generator bypass deactivated). | | |
| Dependency: | The parameter has no effect for p2252 bit 5 = 1 (integrator hold deactivated). See also: r2273 | | |

Note: Only p2251 = 0:
If the output signal of the technology controller reaches a skip band in the speed setpoint channel, then the integral component of the controller is held, if at the same time, the system deviation is lower than the threshold value set here. By holding the integral component, it can be avoided that the controller oscillates in the range of the skip bands.

| CU240D-2_DP_F | Unit group: - | Unit selection: - | Function diagram: 7958 |
| CU240D-2_PN_F | Min: 0 | Max: 2 | Factory setting: 0 |
| Description: | Sets the response of the technology controller to the occurrence of fault F07426 (technology controller actual value limited). The fault response is executed if status bit 8 or 9 in the technology controller status word r2349 is set. If both status bits are zero, a switch back to technology controller operation will follow. | | |
| Value: | 0: Function inhibited 1: On fault: Changeover to r2344 (or p2302) 2: On fault: Changeover to p2215 | | |
| Dependency: | The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint). See also: p2267, p2268, r2344 See also: F07426 | | |
| Notice: | Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case, a different fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected. | | |
| Note: | The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero. If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint). | | |

Description: Setting to assign the encoder.
The actual value preprocessing and the closed-loop position control are carried out using the assigned encoder.

Value:
0: No encoder
1: Encoder 1
2: Encoder 2

Dependency: See also: p0187, p0188

Notice: For the setting p2502 = 0 (no encoder), closed-loop position control is not possible. This setting is only practical as supportive measure to implement encoderless closed-loop speed control (e.g. if the motor encoder is defective).

Note: The assigned encoder (p2502 = 1, 2) must be allocated an encoder data set (p0187, p0188).

Description: Sets the neutral length units LU per 10 mm.
Therefore, for a linear scale, a reference is established between the physical arrangement and the neutral length units LU used in the drive.

Example:

Linear scale, 10 mm should be broken down to units of μm (i.e. 1 LU = 1 μm).

--> p2503 = 10000

Note: The assignment to the grid spacing can be achieved using this for a rotary axis with linear encoder.

| Description: | Sets the neutral length units LU per load revolution. Therefore, for a rotary encoder, a reference is established between the physical arrangement and the neutral length units LU used in the drive. Example: Rotary encoder, ballscrew with 10 mm/revolution, 10 mm should be broken down to units of μm (i.e. 1 LU = 1 μm). --> One load revolution corresponds to 10000 LU --> p2506 = 10000 | | |
| Note: | The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the precontrol is active. Increasing p2506 counteracts this behavior. | | |

2 Parameters

2.2 List of parameters

Caution:

For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after switch-off/switch-on. In this range, it is only permissible that the encoder overflows.

After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system.

If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443.

There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after switch-off/switch-on. When adjusting, the position actual value is set to the reference point.

Note:

The encoder adjustment is initiated with p2507 = 2. The status is displayed using the other values.

In order to permanently save the determined position offset (p2525) and the DDS number (p2733), they must be saved in a non-volatile fashion (p0971, p0977).

This adjustment can only be initiated for an absolute encoder.

| | Unit group: - | Unit selection: - | Function diagram: 4015 |
| | Min: 0.00 [ms] | Max: 1000.00 [ms] | Factory setting: 0.00 [ms] |
| Description: | Sets the time constant for the position setpoint filter (PT1). | | |
| Note: | The effective Kv factor (position loop gain) is reduced with the filter. This allows a softer control behavior with improved tolerance with respect to noise/disturbances. Applications: - reduces the precontrol dynamic response. - jerk limiting. | | |

| Description: | Setting for activation and weighting of the speed precontrol value. Value = 0 % --> The precontrol is deactivated. | | |
| Dependency: | See also: p2535, p2536, r2563 | | |
| Note: | When the axis control loop is optimally set as well as a precisely determined equivalent time constant of the speed control loop, the precontrol factor is 100%. | | |

| CU250D-2_DP_F | Can be changed: U, T | Scaling: - | Dyn. index: DDS, p0180 |
| | Unit group: - | Unit selection: - | Function diagram: 4015 |
| | Min: 0.00 | Max: 2.00 | Factory setting: 0.00 |
| Description: | Sets the "fractional" dead time to emulate the timing behavior of the speed control loop. The selected multiplier refers to the position controller clock cycle (dead time= p2535 * p0115[4]). | | |
| Dependency: | See also: p2536 | | |
| Notice: | When speed precontrol is active (p2534 > 0 %), the following applies: In addition to the set dead time (p2535), internally two position controller clock cycles are effective. When speed precontrol is inactive (p2534 = 0 %), the following applies: No dead time is effective (p2535 and internal). | | |
| Note: | Together with p2536, the timing behavior of the closed-loop control loop can be emulated. | | |

| | Unit group: - | Unit selection: - | Function diagram: 4015 |
| | Min: 0.00 [ms] | Max: 100.00 [ms] | Factory setting: 0.00 [ms] |
| Description: | Sets a PT1 filter to emulate the timing behavior of the closed-speed control loop. | | |
| Dependency: | See also: p2535 | | |
| Notice: | When speed precontrol is inactive (p2534 = 0 %), the following applies: If a PT1 filter has been set, it is not effective. | | |
| Note: | Together with p2535, the timing behavior of the closed-loop control loop can be emulated. | | |

The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input.
For $0\% < p2534 < 100\%$ (precontrol activated) or $p2534 = 0\%$ (precontrol deactivated) the following applies:
The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller.

| Dependency: | See also: p2534, r2564 | | |
| Note: | When calculating the torque precontrol value (r2654), the time derivation of the speed precontrol value is multiplied by $2 \text{ PI} * p2567$. For reasons associated with the compatibility to earlier firmware versions, the factory setting for $p2567 = 1 \text{ kgm}^2/2 \text{ PI}$. This means that CO: r2564 remains as standard the derivation over time of the speed precontrol value and is referred, as before, to a moment of inertia of $1 \text{ kgm}^2/2 \text{ PI}$. For torque precontrol, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the precontrol value). | | |

| | Min: 1 [1000 LU/s ³] | Max: 100000000 [1000 LU/s ³] | Factory setting: 10000 [1000 LU/s ³] |
| Description: | Sets the jerk limiting | | |
| Dependency: | See also: p2572, p2573, p2575 | | |
| Note: | The jerk limiting is internally converted into a jerk time as follows: Jerk time $T_r = \max(p2572, p2573) / p2574$ The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]). The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573). For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values. If, in the traversing profile, the acceleration time without jerk limiting is less than the jerk time T_r , then the motion with jerk limiting is not optimum from a time perspective. For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk. CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle. For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time. | | |

| | Min: - | Max: - | Factory setting: 0 |

Description: Sets the signal source to activate the "software limit switch".

Dependency: See also: p2578, p2579, p2580, p2581

Caution: Software limit switch effective:
 - axis is referenced (r2684.11 = 1) and BI: p2582 = 1 signal.
 Software limit switch ineffective:
 - modulo correction active (BI: p2577 = 1 signal).
 - search for reference is executed.

Notice: Target position for relative positioning outside software limit switch:
 The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated.
 Target position for absolute positioning outside software limit switch:
 In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output.
 Axis outside the valid traversing range:
 If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

Note: The traversing range can also be limited using STOP cams.

| | Unit group: - | Unit selection: - | Function diagram: 3635 |
| | Min: -200000 [LU] | Max: 200000 [LU] | Factory setting: 0 [LU] |

Description: Sets the amount of play (backlash) for positive or negative play.
 0: The backlash compensation is deactivated.
 > 0: Positive backlash (normal case)
 When the direction is reversed, the encoder actual value leads the actual value.
 < 0: Negative backlash
 When the direction is reversed, the actual value leads the encoder actual value.

Dependency: If a stationary axis is referenced by setting the reference point, or an adjusted with absolute encoder is switched on, then the setting of p2604 is relevant for entering the compensation value.
p2604 = 1:
Traveling in the positive direction -> A compensation value is immediately entered.
Traveling in the negative direction -> A compensation value is not entered
p2604 = 0:
Traveling in the positive direction -> A compensation value is not entered
Traveling in the negative direction -> A compensation value is immediately entered.
When again setting the reference point (a referenced axis) or for "flying referencing", p2604 is not relevant but instead the history of the axis.

Description: Sets the configuration for additional functions for the basic positioner (EPOS).

| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
|-------------------|------------|-----------------------------------|------------------|-----------------|-----------|
| | 00 | Activate position feedback signal | Yes | No | - |
| | 01 | HW limit switch evaluation | Level evaluation | Edge evaluation | - |

Note: For bit 00: When the bit is set, for traversing blocks with absolute target positions (p2617[x]) when the tolerance window (p2688) is reached, the traversing block number (p2616[x]) is output bit-coded (r2689).
For a bit 01: When the bit is set, the hardware limit switch is evaluated, level-triggered. This setting is recommended for a poor position actual value resolution, as in this case the direction does not have to be evaluated.

| | Min: 1 [1000 LU/min] | Max: 40000000 [1000 LU/min] | Factory setting: 300 [1000 LU/min] |
| Description: | Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference. | | |
| Dependency: | If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark. See also: p2595, p2597, p2604, p2607, p2609, p2610 | | |
| Caution: | If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained. After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks. | | |
|  | | | |
| Note: | The velocity override is not effective when traversing to the zero mark. | | |

| | Unit group: - | Unit selection: - | Function diagram: 3616 |
| | Min: 1.0 [%] | Max: 100.0 [%] | Factory setting: 100.0 [%] |

Description: Sets the deceleration override for the traversing block.
The override refers to the maximum deceleration (p2573).

Dependency: The number of indices depends on p2615.
See also: p2573, p2615, p2616, p2617, p2618, p2619, p2621, p2622, p2623, p2624

Notice: If, when calculating the traversing profile, it is identified that the target position of the next block with the programmed deceleration override will not be reached without direction reversal (flying block change), then the old (actual) deceleration override remains effective.

Description: Sets the signal source for the feedback signal "fixed stop reached".

BI: p2637 = 1 signal

Fixed stop is reached.

BI: p2637 = 0 signal

Fixed stop is not reached.

Dependency: See also: r2526, p2634

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: The identification of "fixed stop reached" is, for the factory setting, dependent on the signal BO: r2526.4 (fixed stop reached). This signal is influenced via p2634 (EPOS fixed stop, maximum following error).

Description: Sets the signal source for the feedback signal "fixed stop outside the monitoring window".

BI: p2638 = 1 signal

Fixed stop is located outside the monitoring window.

BI: p2638 = 0 signal

Fixed stop is inside the monitoring window.

Dependency: See also: r2526, p2635

Note: The identification of "fixed stop outside the monitoring window" is, for the factory setting, dependent on signal BO: r2526.5 (fixed stop outside window). This signal is influenced via p2635 (EPOS fixed stop monitoring window).

| Note: | For bit 00: Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support. |
| | For bit 01: A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring. |
| | For bit 02: The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings. |
| | For bit 03: An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan). |
| | For bit 04: The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling. |
| | For bit 05: A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor. |
| | For bit 06: The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling. |
| | For bit 07: The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles. |
| | For bit 08: A safety operation monitoring function (Safety) has detected an error. |
| | For bit 09: When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies. |
| | For bit 10: The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles. |
| | For bit 11: The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control. |
| | For bit 15: Group fault. Determine the precise cause of the fault using the commissioning tool. |

2 Parameters

2.2 List of parameters

Note:

For bit 00 = 1:
The limit switch enables motion.
For example, this bit can be used for interconnection with binector input p0840 (ON/OFF1).

For bit 01 = 0:
The drive cannot be moved as a result of the limit switch function (e.g. as a result of the switching on inhibited).
For example, this bit can be used for interconnection with binector input p0848 (OFF3).

For bit 02 = 1:
The axis is at zero speed.

For bit 04 = 1:
The plus limit switch reached.

For bit 05 = 1:
The minus limit switch reached.

| Description: | <p>Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.</p> <p>The speed of this changeover point is pre-assigned when automatically calculating with the changeover speed p1752. The changeover point located below is pre-assigned with the changeover speed $p1752 * (1 - p1753)$.</p> <p>Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).</p> <p>Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.</p> | | |
| Dependency: | <p>As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.</p> <p>See also: p3843</p> | | |
| Notice: | <p>If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).</p> | | |
| Note: | <p>For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.</p> | | |

| | Min: 0 | Max: 3 | Factory setting: 0 |
| Description: | <p>Setting for the friction characteristic record.</p> <p>After the next switch-on command, the friction characteristic is automatically recorded.</p> | | |
| Value: | <p>0: Friction characteristic record deactivated 1: Friction char record activated for all directions 2: Friction char record activated for positive direction 3: Friction char record activated for negative direction</p> | | |
| Dependency: | <p>When selecting the friction characteristic measurement, the drive data set changeover is suppressed.</p> <p>For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.</p> | | |
| Danger: | <p>For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.</p> | | |
|  | | | |
| Notice: | <p>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).</p> | | |
| Note: | <p>When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).</p> <p>When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.</p> <p>When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.</p> | | |

Note: The absolute value is only valid after passing the zero mark.
 For value = 1:
 The value in XIST1_ERW is reset when passing every zero mark.
 If value = 2:
 The value in XIST1_ERW is reset with a 0/1 edge via binector input p4655.
 If value = 3:
 The value in XIST1_ERW is reset after a 0/1 edge via binector input p4655 when passing the next zero mark.

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0 | Max: 1000 | Factory setting: 2 |
| Description: | Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, then the pulse number is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be deactivated using p0437.7. | | |
| Dependency: | See also: p0437, p4688 See also: F31131 | | |
| Note: | This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC. | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: -1001 | Max: 0 | Factory setting: -1001 |
| Description: | Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be deactivated using p0437.7. | | |
| Dependency: | See also: p0437, p4681, p4688 See also: F31131 | | |
| Note: | This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder. | | |

| | 02 | Load adaptation Kp | Yes | No | - |
| | 06 | Do not change Kp | Yes | No | - |
| Note: | For bit 00: For significant differences between the motor and load moment of inertia, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased. This function should only be set when the speed precontrol (bit 3 = 1) or the torque precontrol (bit 4 = 1) is active. | | | | |
| | For bit 01: At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill. | | | | |
| | For bit 02: The estimated load moment of inertia is taken into account for the speed controller gain (see p5273). | | | | |
| | For bit 03: Activates the speed precontrol for the basic positioner (EPOS). | | | | |
| | For bit 04: Activates the torque precontrol for the basic positioner (EPOS). | | | | |
| | For bit 05: The maximum setpoint acceleration for the basic positioner (EPOS) is determined based on the estimated moment of inertia. This is realized by activating the bit once. The prerequisite is that the drive pulses are inhibited, and the moment of inertia was previously determined. | | | | |
| | For bit 06: The speed controller gain set in p1460 is not changed when calculating the controller data. | | | | |

2 Parameters

2.2 List of parameters

Dependency: The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function.

See also: r5311, p5312, p5313, p5314, p5315

Note:

Possible bit combinations:

Bit 1, 0

= 0, 0 --> function not active

= 0, 1 --> cyclic calculation of the coefficients without moment of inertia precontrol (commissioning)

= 1, 0 --> moment of inertia precontrol activated (without cyclic calculation of the coefficients)

= 1, 1 --> moment of inertia precontrol activated (with cyclic calculation of the coefficients)

For bit 00:

Calculation for the constant and linear coefficients of the moment of inertia precontrol is activated. The results are written to parameters (p5312, p5313, p5314, p5315).

For bit 01:

The moment of inertia precontrol is activated.

The moment of inertia is calculated from the currently measured load torque and the saved coefficients (p5312, p5313, p5314, p5315).

Description: Sets the reference serial number for the Control Unit.
Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.

Dependency: See also: p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Dependency: See also: p7761, p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

For bit 00:
Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:
The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:
If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:
Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and p7765 bit 00 is set.

For bit 05:
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and in p7765 bit 01 is set and not bit 00.

For bit 06:
When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and in p7765.2 is set.

| Dependency: | See also: p7766, p7767, p7768 | | | | |
| Note: | KHP: Know-How Protection For copy protection, the serial numbers of the memory card and/or Control Unit are checked. The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated. For bit 00, 01: If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies. There is no copy protection if both bits are set to 0. | | | | |

| Dependency: | See also: p7767, p7768 | | | | |
| Notice: | An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. When using the STARTER commissioning software, the password should be entered using the associated dialogs. The following rules apply when entering the password: - password entry must start with p7766[0]. - no gaps are permissible in the password. - entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters). | | | | |

2 Parameters

2.2 List of parameters

Note: KHP: Know-How Protection
When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed.
Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.
Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.
A product-specific list of these parameters is also available in the corresponding List Manual.

Description: Sets the reference serial number for the memory card.
Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.
Dependency: See also: p7765, p7766, p7767, p7768
Note: KHP: Know-How Protection
- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

| Description: | Setting to backup/import/delete NVRAM data. NVRAM data are non-volatile data in the device (e.g. fault buffer). For NVRAM data actions, the following data are excluded: - crash diagnostics - CU operating hours counter - CU temperature - safety logbook | | |
| Value: | 0: Inactive 1: NVRAM data backup to memory card 2: Import NVRAM data from the memory card 3: Delete NVRAM data in the device 10: Error when clearing 11: Error when backing up, memory card not available 12: Error when backing up, insufficient memory space 13: Error when backing up 14: Error when importing, memory card not available 15: Error when importing, checksum error 16: Error when importing, no NVRAM data available 17: Error when importing | | |
| Notice: | For value = 2, 3: These actions are only possible when pulses are inhibited. | | |
| Note: | After the action has been successfully completed, the parameter is automatically set to zero. The actions importing and deleting NVRAM data immediately initiate a warm restart. If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10). | | |

| Can be changed: - | Scaling: - | Dyn. index: - | |
| Unit group: - | Unit selection: - | Function diagram: - | |
| Min: | Max: | Factory setting: | |
| - | - | - | |

Description: Displays the version of the firmware stored on the memory medium of the drive device.
Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.

Index: [0] = Internal
[1] = External
[2] = Parameter backup

Note: For index [0]:
Displays the internal firmware version (e.g. 04402315).
This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.
For index [1]:
Displays the external firmware version (e.g. 04040000 -> 4.4).
For automation systems with SINAMICS Integrated this is the runtime version of the automation system.
For index [2]:
Displays the internal firmware version of the parameter backup.
With this CU firmware version, the parameter backup was saved, which was used when powering up.

| Dependency: | See also: p8806, p8808 | | |

Note: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
 For p8807[0...15]:
 Dates of installation or first commissioning of the device with the following format options (ASCII):
 YYYY-MM-DD
 or
 YYYY-MM-DD hh:mm
 - YYYY: year
 - MM: month 01 ... 12
 - DD: day 01 ... 31
 - hh: hours 00 ... 23
 - mm: minutes 00 ... 59
 Separators must be placed between the individual data, i.e. a hyphen '-', space ' ' and colon ':'.

Description: Parameters for the PROFINET data set "Identification and Maintenance 4" (I&M 4).
 This information is known as "Signature".

Dependency: This parameter is preassigned as standard (see note).
 After writing information to p8809, p8805 is automatically set to = 1.
 See also: p8805

Note: For p8805 = 0 (factory setting) the following applies:
 Parameter p8809 contains the information described below.
 For p8809[0...3]:
 Contains the value from r9781[0] "SI change tracking checksum functional".
 For p8809[4...7]:
 Contains the value from r9782[0] "SI change tracking time stamp checksum functional".

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: | Max: | Factory setting: |
| | 0 | 255 | 0 |
| Description: | Sets the subnet mask for the onboard PROFINET interface on the Control Unit. The actual subnet mask is displayed in r8933. | | |
| Dependency: | See also: p8925, r8933 | | |
| Note: | The interface configuration (p8920 and following) is activated with p8925. The parameter is not influenced by setting the factory setting. | | |

| | | | |
|---------------------|--|--------------------------|-----------------------------|
| p8924 | PN DHCP Mode / PN DHCP mode | | |
| CU240D-2_PN | Access level: 3 | Calculated: - | Data type: Integer16 |
| CU240D-2_PN_F | Can be changed: U, T | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: | Max: | Factory setting: |
| | 0 | 3 | 0 |
| Description: | Sets the DHCP mode for the onboard PROFINET interface on the Control Unit. The actual DHCP mode is displayed in r8934. | | |
| Value: | 0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station | | |
| Dependency: | See also: p8925, r8934 | | |
| Notice: | When the DHCP mode is active (p8924 not equal to 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool. | | |
| Note: | The interface configuration (p8920 and following) is activated with p8925. The active DHCP mode is displayed in parameter r8934. The parameter is not influenced by setting the factory setting. | | |

| | | | |

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: | Max: | Factory setting: |
| | 0 | 3 | 0 |
| Description: | Setting to activate the interface configuration for the onboard PROFINET interface on the Control Unit. p8925 is automatically set to 0 at the end of the operation. | | |
| Value: | 0: No function 1: Reserved 2: Activate and save configuration 3: Delete configuration | | |
| Dependency: | See also: p8920, p8921, p8922, p8923, p8924 | | |
| Notice: | When the DHCP mode is active (p8924 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool. | | |
| Note: | For p8925 = 2: The interface configuration (p8920 and following) is saved and activated after the next POWER ON. For p8925 = 3: The factory setting of the interface configuration is loaded after the next POWER ON. | | |

Dependency: See also: p9501

See also: F01682, F01683

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For bit 30 = 1, PROFIsafe telegram 900 must be configured in the F host.

A change only becomes effective after a POWER ON.

F-DI: Failsafe Digital Input

SDI: Safe Direction (safe motion direction)

SLS: Safely-Limited Speed

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

Dependency: See also: A01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

2 Parameters

2.2 List of parameters

Note: For bit 00:
When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.
For bit 01:
When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

p9309 SI Motion behavior during pulse cancellation (processor 2) / SI Mtn behav Pc P2

| | | | |
|---------------|------------------------------|--------------------------|------------------------------|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: Unsigned32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | - | - | 0000 0000 1111 1111 bin |

Description: Sets the behavior of safety functions and their feedback during pulse cancellation in encoderless operation.

| Bit array: | Bit | Signal name | 1 signal | 0 signal | FP |
|-------------------|------------|---|------------------|-----------------|-----------|
| | 00 | SSM during pulse cancellation and encoderless | Becomes inactive | Remains active | - |
| | 08 | SDI during pulse cancellation and encoderless | Becomes inactive | Remains active | - |

Dependency: See also: A01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse cancellation, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse cancellation. The feedback signal last displayed before pulse cancellation is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse cancellation, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse cancellation. The status signal indicates active and the system goes into the STO state.

p9321[0...7] SI Motion gearbox motor/load denominator (processor 2) / SI Mtn gear den P2

| | | | |
|---------------|------------------------------|--------------------------|------------------------------|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: Unsigned32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 1 | 2147000000 | 1 |

Description: Sets the denominator for the gearbox between the motor and the load.

Index:

[0] = Gearbox 1
[1] = Gearbox 2
[2] = Gearbox 3
[3] = Gearbox 4
[4] = Gearbox 5
[5] = Gearbox 6
[6] = Gearbox 7
[7] = Gearbox 8

Dependency: See also: p9322

Notice: It is not possible to change over the gearbox stages. Gearbox 1 (index 0) is always active.

p9322[0...7] SI Motion gearbox motor/load numerator (processor 2) / SI Mtn gear num P2

| | | | |
|---------------|------------------------------|---------------------------|------------------------------|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: Unsigned32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 1 | Max: 2147000000 | Factory setting: 1 |

Description: Sets the numerator for the gearbox between the motor and the load.

Index:
 [0] = Gearbox 1
 [1] = Gearbox 2
 [2] = Gearbox 3
 [3] = Gearbox 4
 [4] = Gearbox 5
 [5] = Gearbox 6
 [6] = Gearbox 7
 [7] = Gearbox 8

Dependency: See also: p9321

Notice: It is not possible to change over the gearbox stages. Gearbox 1 (index 0) is always active.

Note: In the case of encoderless monitoring functions, the pole pair number must be multiplied by the numerator of the gearbox ratio.

Example:

Gearbox ratio 1:4, pole pair number (r0313) = 2

--> p9321 = 1, p9322 = 8 (4 x 2)

p9331[0...3] SI Motion SLS limit values (processor 2) / SI Mtn SLS lim P2

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 0.01 [rpm] | Max: 100000.00 [rpm] | Factory setting: 2000.00 [rpm] |

Description: Sets the limit values for the function "Safely-Limited Speed" (SLS).

Index:
 [0] = Limit value SLS1
 [1] = Limit value SLS2
 [2] = Limit value SLS3
 [3] = Limit value SLS4

Dependency: See also: p9363, p9531

See also: A01714

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SLS: Safely-Limited Speed

p9342 SI Motion act. val. comparison tol (cross-ch.) (processor 2) / SI Mtn actV tol P2

| | | | |
|---------------|------------------------------|-----------------------------|--|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 0.0010 [°] | Max: 360.0000 [°] | Factory setting: 12.0000 [°] |

Description: Sets the tolerance for the crosswise data comparison of the actual position between processors 1 and 2.

Dependency: See also: p9542

See also: A01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

p9344 SI Motion actual value comparison tolerance (referencing) (MM) / SI mtn ref tol MM

| | | |
|------------------------------|-----------------------------|--|
| Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| Can be changed: C(95) | Scaling: - | Dyn. index: - |
| Unit group: - | Unit selection: - | Function diagram: - |
| Min: 0.0000 [mm] | Max: 36.0000 [mm] | Factory setting: 0.0100 [mm] |

Description: Sets the tolerance for checking the actual values.
For an incremental encoder, the actual values are checked after referencing; for an absolute encoder, when switching on.

Dependency: See also: A01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: A change only becomes effective after a POWER ON.
For linear axes, the maximum value is limited to 1 mm.

p9345 SI Motion SSM filter time (processor 2) / SI Mtn SSM filt P2

| | | | |
|---------------|------------------------------|-------------------------------|--------------------------------------|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: 2823 |
| CU250D-2_DP_F | Min: 0.00 [µs] | Max: 100000.00 [µs] | Factory setting: 0.00 [µs] |

Description: Sets the filter time for the SSM feedback signal to detect standstill ($n < nx$).

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The filter time is effective only if the function is enabled ($p9301.16 = p9501.16 = 1$).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.
The parameter is included in the data cross-check of the two monitoring channels.
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

p9346 SI Motion SSM velocity limit (processor 2) / SI Mtn SSM v_limP2

| | | | |
|---------------|------------------------------|--------------------------------|--|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |
| CU240D-2_PN_F | Can be changed: C(95) | Scaling: - | Dyn. index: - |
| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: 2823 |
| CU250D-2_DP_F | Min: 0.00 [rpm] | Max: 100000.00 [rpm] | Factory setting: 20.00 [rpm] |

Description: Sets the velocity limit for the SSM feedback signal to detect standstill ($n < nx$).
When this limit value is undershot, the signal "SSM feedback signal active" is set.

Dependency: See also: p9546

Caution: The following applies for $p9306 = 3$:

The "SAM" function is switched out if the selected threshold value is undershot.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

p9347 SI Motion SSM velocity hysteresis (processor 2) / SI Mtn SSM Hyst P2

| | | | |
|---------------|------------------------------|-------------------------------|--|
| CU240D-2_DP_F | Access level: 3 | Calculated: - | Data type: FloatingPoint32 |

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: 2823 |
| CU250D-2_DP_F | Min: 0.0010 [rpm] | Max: 500.0000 [rpm] | Factory setting: 10.0000 [rpm] |

Description: Sets the velocity hysteresis for the SSM feedback signal to detect standstill ($n < nx$).

Dependency: See also: A01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The velocity hysteresis is effective only if the function is enabled (p9301.16 = p9501.16 = 1).
The parameter is included in the data cross-check of the two monitoring channels.
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 0.00 [rpm] | 120000.00 [rpm] | 300.00 [rpm] |

Description: Sets the velocity tolerance for the "SAM" function.

Dependency: See also: p9548
See also: A01706

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)

| | 0.00 [µs] | 600000000.00 [µs] | 100000.00 [µs] |

Description: Sets the delay time for the SLS changeover for the function "Safely-Limited Speed" (SLS).
When transitioning from a higher to a lower Safely-Limited Speed level, within this delay time, the "old" speed level remains active.

Even if SLS is activated from the state "SLS in active", then this delay is still applied.

Dependency: See also: p9551

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SLS: Safely-Limited Speed

Description: Sets the delay time for STOP A after STOP B / SS1.

Dependency: See also: p9360, p9556
See also: F01701

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The set time is rounded internally to an integer multiple of the monitoring clock cycle.

| CU250D-2_DP_F | Min: 10.00 [rpm] | Max: 6000.00 [rpm] | Factory setting: 10.00 [rpm] |

Description: Sets the shutdown speed for the pulse cancellation.

Below this speed "standstill" is assumed and for STOP B / SS1, the pulses are suppressed (by changing to STOP A).

Dependency: See also: p9356, p9560

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The shutdown speed has no effect for a value = 0.

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 0 | Max: 1 | Factory setting: 0 |

Description: Sets the stop response for the function "Safely-Limited Speed" (SLS).

These settings apply to the individual limit values for SLS.

Value: 0: STOP A

1: STOP B

Index: [0] = Limit value SLS1

[1] = Limit value SLS2

[2] = Limit value SLS3

| CU250D-2_DP_F | Min: | Max: | Factory setting: | |
| | -1 | 4 | -1 | |
| Description: | Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small. | | | |
| Dependency: | See also: p9507 See also: F30681, A30711 | | | |
| Notice: | This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787). | | | |
| Note: | This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - For synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2). | | | |

| | 5.00 [ms] | 1000.00 [ms] | 100.00 [ms] | |
| Description: | Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346). | | | |
| Dependency: | See also: A30711 | | | |
| Caution: | The safety functionality is only completely guaranteed after this time has expired. | | | |
|  | | | | |
| Notice: | This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042. | | | |

Description: Sets the behavior of safety functions and their feedback during pulse cancellation in encoderless operation.
Bit array:

| Bit | Signal name | 1 signal | 0 signal | FP |
|-----|---|------------------|----------------|----|
| 00 | SSM during pulse cancellation and encoderless | Becomes inactive | Remains active | - |
| 08 | SDI during pulse cancellation and encoderless | Becomes inactive | Remains active | - |

Dependency: See also: A01711
Notice: For bit 00:
 If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

2 Parameters

2.2 List of parameters

Note: SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)
For bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse cancellation, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse cancellation. The feedback signal last displayed before pulse cancellation is kept and the system goes into the STO state.
For bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse cancellation, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse cancellation. The status signal indicates active and the system goes into the STO state.

Description: Sets the velocity tolerance limit for the "SAM" function.
SAM is deactivated once the set velocity limit has been undershot.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)
For p9568 = p9368 = 0, the following applies:
The value in p9546/p9346 (SSM) is applied as the velocity limit for SAM.

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: -1 | Max: 4 | Factory setting: -1 |
| Description: | Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small. | | |
| Dependency: | See also: r9787 See also: F01681, A01711 | | |
| Notice: | Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787). | | |
| Note: | This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - For synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2). | | |

| CU250D-2_DP_F | Min: 5.00 [ms] | Max: 1000.00 [ms] | Factory setting: 100.00 [ms] |
| Description: | Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346). | | |

Dependency: See also: A01711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

| CU250D-2_DP_F | Min: 0.00 [ms] | Max: 100.00 [ms] | Factory setting: 25.00 [ms] |

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: A longer filter time results in a longer response time.

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 0.00 [%] | Max: 1000.00 [%] | Factory setting: 10.00 [%] |

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).

- the value must be increased if C01711 has occurred with message value 1042.

- the value must be decreased if C01711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:

$|p0305 \times p9783| \geq p9588 \times 1.2$

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: See also: r9785

See also: A01711

Notice: If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

| CU250D-2_PN_F | Unit group: - | Unit selection: - | Function diagram: - |
| CU250D-2_DP_F | Min: 10.00 [%] | Max: 3300.00 [%] | Factory setting: 100.00 [%] |

Description: Sets the acceleration limit to filter velocity fluctuations.

If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C01711 with message value 1043 has occurred.

- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

| Index: | [0] = Actual velocity resolution [1] = Minimum velocity resolution | | |
| Note: | Index 0: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Index 1: For a two-encoder system, with just non-safety capable encoders, this means the poorer value of the two encoders. Index[1] takes into account the coarse resolution of the encoder only | | |

| CU250D-2_DP_F | Min: - [rpm] | Max: - [rpm] | Factory setting: - [rpm] |
| Description: | Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value. | | |
| Recommendation: | For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - CI: p1051 = r9733[0] - CI: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088. | | |
| Index: | [0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute | | |

- Dependency:** For SLS: $r9733[0] = p9531[x] \times p9533$ (converted from the load side to the motor side)
 For SDI negative: $r9733[0] = 0$
 For SLS: $r9733[1] = -p9531[x] \times p9533$ (converted from the load side to the motor side)
 For SDI positive: $r9733[1] = 0$
 [x] = Selected SLS stage
 Conversion factor from the motor side to the load side:
 - motor type = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$
 - otherwise: $p9522 / p9521$
 See also: p9531, p9533
- Notice:** If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa.
 If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.
- Note:** If the "SLS" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082.
 The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9720 and r9722.

| | Min: 0.00 [µs] | Max: 2000000.00 [µs] | Factory setting: 500000.00 [µs] |
| Description: | Sets the discrepancy time for the changeover of the Failsafe Digital Input for STO on processor 2. An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an F-DI changeover, dynamic data is not subject to a data cross-check during this discrepancy time. | | |
| Dependency: | See also: p9650 | | |
| Notice: | This parameter is overwritten by the copy function of the safety functions integrated in the drive. | | |
| Note: | For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. F-DI: Failsafe Digital Input | | |

| | Unit group: - | Unit selection: - | Function diagram: - |
| | Min: 0.00 [µs] | Max: 100000.00 [µs] | Factory setting: 0.00 [µs] |
| Description: | Sets the debounce time for the Failsafe Digital Inputs used to control the "STO" function. The debounce time is rounded to whole milliseconds. | | |
| Dependency: | See also: p9651 | | |
| Notice: | This parameter is overwritten by the copy function of the safety functions integrated in the drive. | | |
| Note: | Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the Failsafe Digital Inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed. | | |

2.2 List of parameters

Note: For index [1]:
The value shows the total computing time load of the system.
For index [5]:
The total utilization is determined using all sampling times used. The largest total utilization is mapped here. The sampling time with the largest total utilization is displayed in r9979.
Total utilization:
Computing time load of sampling time involved including load from higher-priority sampling times (interrupts).

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 4.00 [ms] | 2000.00 [ms] | 500.00 [ms] |

Description: Sets the delay time for testing the digital output.
Within this time, for a forced checking procedure of the digital output, the signal must have been detected via the corresponding readback input (p10047).

Dependency: See also: p10003, p10007, p10017, p10046

Note: The delay time must be set to a value greater than the debounce time (p10017).
Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test.
The test stop is only performed if the safety output is being used (see p10042).

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 1.00 [ms] | 2000.00 [ms] | 500.00 [ms] |

Description: Sets the discrepancy time for digital inputs.
The signal states at the two associated digital inputs (F-DI) must assume the same state within this discrepancy time.

Dependency: See also: p10102

p10003 **SI Motion forced checking procedure timer / SI Mtn dyn t**

| | | | |

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 0.00 [h] | 8760.00 [h] | 8.00 [h] |

Description: Sets the time to carry out the forced checking procedure (test stop).
Within the parameterized time, the digital inputs/outputs must have been subject to a forced checking procedure at least once.

Dependency: See also: p10002, p10007, p10046

p10006 SI Motion acknowledgment internal event F-DI (processor 1) / SI Mtn ackn int P1

| | | | |
|---------------|------------------------------|--------------------------|-----------------------------|

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 0 | 255 | 0 |

Description: Select a Failsafe Digital Input (F-DI) for the signal "acknowledge internal event" (internal fault).

The falling edge at this input resets the status "internal event" in the drive.

The rising edge at this input acknowledges any existing discrepancy errors.

Value:

0: Static selected
 1: F-DI 0
 2: F-DI 1
 3: F-DI 2
 255: Static deselected

Dependency: See also: p10106

See also: A01666, A30666

Note: The values "static selected" and "static deselected" result in an inactive function of the safe acknowledgment.
 F-DI: Failsafe Digital Input

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | - | - | 0 |

Description: Selects an input terminal to start the test stop.

The test stop is started with a 0/1 signal at the input terminal and is then only possible if the drive is not in commissioning mode.

Dependency: See also: p10001, p10002, p10003, p10046

| CU250D-2_DP_F | Min: | Max: | Factory setting: |
| | 0.00 [ms] | 100.00 [ms] | 1.00 [ms] |

Description: Sets the debounce time for digital inputs.

The debounce time is accepted rounded off to whole milliseconds.

The debounce time acts on the following digital inputs:

- Failsafe Digital Inputs (F-DI).
- Single-channel digital inputs (DI).
- Single-channel digital input 5 (DI 5, read back input for the forced checking procedure).

Dependency: See also: p10117

Note: Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

The debounce result can be read in r10051.

2 Parameters

2.2 List of parameters

Note: If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- Logical "0": Safety function is selected
- Logical "1": Safety function is deselected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Description: Sets the delay time for testing the digital output.

Within this time, for a forced checking procedure of the digital output, the signal must have been detected via the corresponding readback input (p10047).

Dependency: See also: p10003, p10007, p10046

Note: The delay time must be set to a value greater than the debounce time (p10017).

Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test.

The test stop is only performed if the safety output is being used (p10142).

Description: Sets the debounce time for digital inputs.
The debounce time acts on the following digital inputs:
- Failsafe Digital Inputs (F-DI).
- Single-channel digital input 2 (DI 2, read back input for the forced checking procedure).
The debounce time is accepted rounded off to whole milliseconds.

Dependency: See also: p10017

Note: Example:
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.
The debounce result can be read in r10151.

2 Parameters

2.2 List of parameters

Note:

F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- Logical "0": Safety function is selected
- Logical "1": Safety function is deselected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

700 999 999

Description: Sets the telegram for the Safety Info Channel (SIC).

The SIC telegram p60122 is attached directly to the PZD telegram p0922/p2079.

Value:
700: Supplementary telegram 700, PZD-0/3
999: Free telegram configuration with BICO

Dependency: See also: p0922, p2071, p2079

Note: The clearance to the PZD telegram can be increased using p2071.

After changing p0922/p2079 or p2071, then p60122 must be set again.

The telegram interconnections can only be changed if p60122 and p0922 are both set to 999.

2.6 Quick commissioning (p0010 = 1)

The parameters required for the quick commissioning (p0010 = 1) are shown in the following table:

Table 2-7 Quick commissioning (p0010 = 1)

| Par. no. | Name | Access level | Can be changed |
|----------|--|--------------|----------------|
| p0010 | Drive, commissioning parameter filter | 1 | C(1)T |
| p0015 | Macro drive unit | 1 | C,C(1) |
| p0100 | IEC/NEMA mot stds | 1 | C(1) |

| p1135 | OFF3 ramp-down time | 2 | C(1)UT |
| p1300 | Open-loop/closed-loop control operating mode | 2 | C(1)T |

Table 2-7 Quick commissioning (p0010 = 1), continued

| Par. no. | Name | Access level | Can be changed |
|----------|--|--------------|----------------|
| p1500 | Torque setpoint selection | 2 | C(1)T |
| p1900 | Motor data identification and rotating measurement | 1 | C(1)T |
| p1905 | Parameter tuning selection | 1 | C(1)T |
| p2196 | Torque utilization scaling | 1 | C(1,3)UT |
| p3900 | Completion of quick commissioning | 1 | C(1) |

If p0010 = 1 is selected, p0003 (user access level) can be used to select the parameters that are to be accessed.

At the end of the quick commissioning, set p3900 = 1 to perform the required motor calculations and reset all other parameters (not included in p0010 = 1) to their default settings.

Note:

This only applies for the quick commissioning.

Symbols for computational and closed-loop control functions

Threshold value switch 1/0
Outputs at y a logical "1" if $x < S$.

Threshold value switch 0/1
Outputs at y a logical "1" if $x > S$.

Threshold value 1/0 with hysteresis
Outputs a logical "1" at y if $x < S$.
If $x \geq S + H$ then y returns to 0.

Threshold value 0/1 with hysteresis
Outputs a logical "1" at y if $x > S$.
If $x \leq S - H$ then y returns to 0.

Limiter
x is limited to the upper limit LU and the lower limit LL and output at y.
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

Sample & Hold element
Sample and hold element.
 $y = x$ if SET = 1
(not retentively saved at POWER OFF)

Symbols for logic functions

NOT element
Logical inversion (negation)

AND element
with logical inversion of an input

OR element

Exclusive-OR/XOR
 $y = 1$ when $x_1 \neq x_2$ is.

Comparator
 $y = 1$ when $x_1 = x_2$ is.

R/S flip-flop
S = setting input
R = reset input
Q = non-inverted output
Q-bar = inverted output

Symbols for computational and closed-loop control functions

Sign reversal
 $y = -x$

Absolute value generator
 $y = |x|$

Divider
 $y = \frac{x_1}{x_2}$

Multiplier
 $y = x_1 \cdot x_2$

Comparator greater than 0
 $y = 1$, if the analog signal $x > 0$, i.e. is positive.

Differentiator
 $y = \frac{dx}{dt}$

Handling BICO technology

Binector:  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

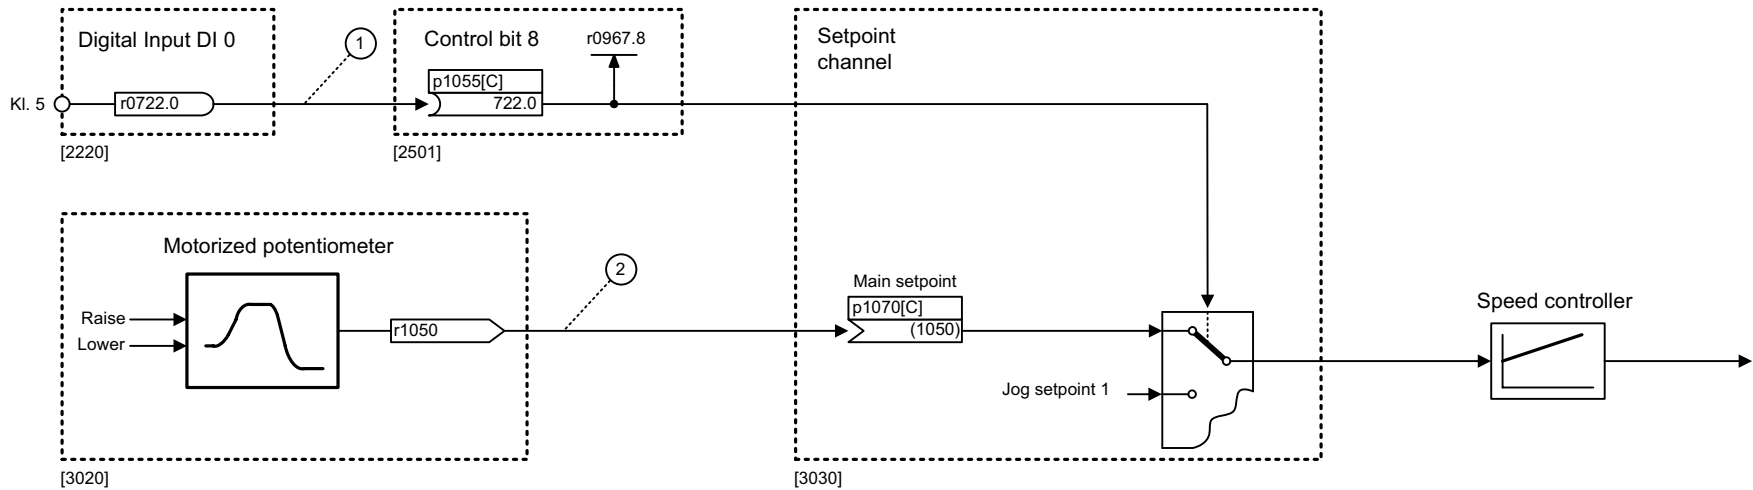

Connector:  Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from Digital Input DI 0 (BO: r0722.0, Terminal 5 (KI. 5)) on the CU.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal 5 (KI. 5) acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

- <1> To comply with the PROFdrive profile, send word 1 must be used as status word 1 (ZSW1).
- <2> Physical word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex, if the input variable has the value p200x). The following applies for temperature values: 100° C -> 100 % = 4000 hex; 0° C -> 0%.
- <3> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD). The two corresponding connector inputs cannot be interconnected.

Fig. 3-59 2701 – Basic brake control

- <1> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
- <2> If p1215 = 0, 2 -> t = 0 ms.
- <3> Only if "Safety Integrated" is active.
- <4> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <5> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or switching on inhibited).
r0046.21 = 1, if p0858 = 1 or p0856 = 0.
The signal generation is shown simplified.
- <6> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).
- <7> If the brake is permanently applied or released (p0855, p0858 or p1215) the drive does not wait while the brake is released or applied.
- <8> Start frequency with U/f control: p1351, p1352 [6310.6]; Start torque with vector control: p1475 [6040.3].

<1> For automatic commissioning, p1037 and p1038 are set to the maximum motor speed (p0322) or to the rated motor speed (p0311), provided that the maximum motor speed has not been specified.
 <2> If initial rounding-off is active (p1030.2 = 1), the selected ramp-up/down times are exceeded accordingly.
 <3> Only effective if p1030.0 = 0.

- <1> The measured value memory is read out using a handshaking technique according to [4720], [4730].
- <2> All other bits in the encoder control word must be 0.
- <3> Increasing position actual values (r0482): The 0/1 edge is evaluated.
Decreasing position actual values (r0482): The 1/0 edge is evaluated.
This means that the same reference point is always used when traversing to an equivalent zero mark.

Changing the fault response for maximum 20 faults <1>

Changing the acknowledge mode for maximum 20 faults <1>

<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting. Changes are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

4.1 Overview of faults and alarms

4.1.1 General

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET
- Display online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

| Type | Description |
|--------|--|
| Faults | <p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault response is triggered. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault. |
| Alarms | <p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves. |

Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

| List | PROFIdrive | Reaction | Description |
|------------------|---------------|---|--|
| NONE | - | None | No response when a fault occurs. Note: With "Basic positioner" (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged. |
| OFF1 | ON/ OFF | Brake along the ramp-function generator down ramp followed by pulse inhibit | Closed-loop speed control (p1300 = 20, 21) <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when speed setpoint <= speed threshold (p1226) has expired. Torque control (p1300 = 22, 23) <ul style="list-style-type: none"> The following applies for closed-loop torque control: Reaction as for OFF2. When the system switches to closed-loop torque control with p1501, the following applies: No separate braking reaction. If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires. |
| OFF1_ DELAYED | - | As for OFF1, however delayed | Faults with this fault response only become effective after the delay time in p3136 has expired. The remaining time up to OFF1 is displayed in r3137. |
| OFF2 | COAST STOP | Internal/external pulse disable | Closed-loop speed and torque control <ul style="list-style-type: none"> Instantaneous pulse suppression, the drive "coasts" to a standstill. The motor holding brake (if one is being used) is closed immediately. Switching-on inhibited is activated. |

4 Faults and alarms

4.1 Overview of faults and alarms

Table 4-2 Fault reactions, continued

| List | PROFIdrive | Reaction | Description |
|------------------|------------|--|---|
| OFF3 | QUICK STOP | Brake along the OFF3 down ramp followed by pulse disable | <p>Closed-loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the holding brake's closing time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when speed setpoint <= speed threshold (p1226) has expired. Switching-on inhibited is activated. <p>Torque control (p1300 = 22, 23)</p> <ul style="list-style-type: none"> Changeover to speed-controlled operation and other reactions as described for speed-controlled operation. |
| STOP2 | - | n_set = 0 | <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). The drive remains in closed-loop speed control. |
| IASC/ DCBRAKE | - | - | <ul style="list-style-type: none"> For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1230 to p1239). |
| ENCODER | - | Internal/external pulse disable (p0491) | <p>The fault reaction ENCODER is applied as a function of the setting in p0491. Factory setting: p0491 = 0 --> Encoder fault causes OFF2</p> <p>Notice: When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.</p> |

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

| Acknowledgment | Description |
|-------------------|---|
| POWER ON | <p>The fault is acknowledged by a POWER ON (switch drive unit off and on again).</p> <p>Note: If this action has not removed the fault cause, the fault is displayed again immediately after power up.</p> |
| IMMEDIATELY | <p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Set acknowledgment by parameter: p3981 = 0 --> 1</p> <p>2 Acknowledging via binector inputs:</p> <p>p2103 BI: 1 Acknowledge faults p2104 BI: 2 Acknowledge faults p2105 BI: 3 Acknowledge faults</p> <p>3 Acknowledging via a PROFIdrive control signal: STW1.7 = 0 --> 1 (edge)</p> <p>Note:</p> <ul style="list-style-type: none"> • These faults can also be acknowledged by a POWER ON operation. • If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged. |

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms (Page 838)" has the following layout:

----- **Start of example** -----

| | |
|-------------------------|---|
| Axxxxx (F, N) | Fault location (optional): Name |
| Message class: | Text of the message class (number according to PROFIdrive) |
| Reaction: | NONE |
| Acknowledgement: | NONE |
| Cause: | Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional). |
| Remedy: | Description of possible remedies. |

----- **End of example** -----

| | |
|----------------------|--|
| Axxxxx | Alarm xxxxx |
| Axxxxx (F, N) | Alarm xxxxx (message type can be changed to F or N) |
| Fxxxxx | Fault xxxxx |
| Fxxxxx (A, N) | Fault xxxxx (report type can be changed to A or N) |
| Nxxxxx | No message |
| Nxxxxx (A) | No message (message type can be changed to A) |
| Cxxxxx | Safety message (separate message buffer) |

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note:

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms (Page 838)" supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 832)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
 - Specifies the "Channel error type" of the PROFINET channel diagnostics.
 - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
 - Specifies the bit number in date set DS1 of the diagnostic alarm for SIMATIC S7.
 - When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
 - Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
 - When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

4 Faults and alarms

4.1 Overview of faults and alarms

- ET 200 (dec)

Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.

- NAMUR (r3113.x)

Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

| Text of the message class (number according to PROFIdrive) Cause and remedy. | Diagnostics interface | | | | |
|---|-----------------------|--------------|----------------------------------|----------------------------------|--------------------|
| | PN (hex) | DS1 (dec) | DP (dec) | ET 200 (dec) | NAMUR (r3113.x) |
| Hardware/software errors (1) A hardware or software malfunction was detected. Carry out a POWER ON for the relevant component. If it occurs again, contact the hotline. | 9000 | 0 | 16 | 9 | 0 |
| Line fault (2) A line supply fault has occurred (phase failure, voltage level ...). Check the line supply and fuses. Check the supply voltage. Check the wiring. | 9001 | 1 | 17 | 24 | 1 |
| Supply voltage fault (3) An electronics supply voltage fault (48 V, 24 V, 5 V ...) was detected. Check the wiring. Check the voltage level. | 9002 | 2 | 2 ¹ 3 ² | 2 ¹ 3 ² | 15 |
| DC-link overvoltage (4) The DC-link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings. | 9003 | 3 | 18 | 24 | 2 |
| Power electronics fault (5) An impermissible operating state of the power electronics was detected (overcurrent, overtemperature, IGBT failure ...). Check compliance with the permissible load cycles. Check the ambient temperatures (fan). | 9004 | 4 | 19 | 24 | 3 |
| Overtemperature of the electronic component (6) The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet ventilation. | 9005 | 5 | 20 | 5 | 4 |
| Ground fault / inter-phase short-circuit detected (7) A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor. | 9006 | 6 | 21 | 20 | 5 |
| Motor overload (8) The motor was operated outside the permissible limits (temperature, current, torque ...). Check the load cycles and set limits. Check the ambient temperature / motor cooling. | 9007 | 7 | 22 | 24 | 6 |

| Communication to the higher-level controller faulted (9) The communication to the higher-level controller (internal coupling, PROFIBUS, PROFINET ...) is faulted or interrupted. Check the state of the higher-level controller. Check the communication connection/-wiring. Check the bus configuration/cycles. | 9008 | 8 | 23 | 19 | 7 |
| Safety monitoring channel has detected an error (10) A safe operation monitoring function has detected an error. | 9009 | 9 | 24 | 25 | 8 |
| Actual position/speed value incorrect or not available (11) An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies. | 900A | 10 | 25 | 29 | 9 |
| Internal (DRIVE-CLiQ) communication faulted (12) The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles. | 900B | 11 | 26 | 31 | 10 |
| Infeed fault (13) The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control. | 900C | 12 | 27 | 24 | 11 |
| Braking controller / Braking Module faulted (14) The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration. | 900D | 13 | 28 | 24 | 15 |
| Line filter fault (15) The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds). | 900E | 14 | 17 | 24 | 15 |
| External measured value / signal state outside of the permissible range (16) A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds. | 900F | 15 | 29 | 26 | 15 |
| Application / technological function faulty (17) The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller. | 9010 | 16 | 30 | 9 | 15 |

| Error in the parameterization/configuration/commissioning procedure (18) An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration. | 9011 | 17 | 31 | 16 | 15 |
| General drive fault (19) Group fault. Determine the precise cause of the fault using the commissioning tool. | 9012 | 18 | 9 | 9 | 15 |
| Auxiliary unit fault (20) The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device. | 9013 | 19 | 29 | 26 | 15 |

1. Undervoltage condition of the electronics power supply
2. Overvoltage condition of the electronics power supply

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions (Page 827)"

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults (Page 829)"

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

| On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults. | |

4.1.3 Number ranges of faults and alarms**Note:**

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms (Page 838)".

Parameters are grouped into the following number ranges:

| | |
|-----------------------|--|
| A01021 | Removable data medium as USB data storage medium from the PC used |
| Message class: | General drive fault (19) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The removable data medium is used as USB data storage medium from a PC As a consequence, the drive cannot access the removable data medium. When backing up, the configuration data cannot be saved on the removable data medium. Alarm value (r2124, interpret decimal): 1: The know-how protection as well as the copy protection for the removable data medium is active. Backup is inhibited. 2: The configuration data are only backed up in the Control Unit. See also: r7760 (Write protection/know-how protection status), r9401 (Safely remove memory card status) |
| Remedy | Deactivate the USB connection to the PC and back up the configuration data. Note: The alarm is automatically canceled when disconnecting the USB connection or when removing the removable data medium. |

| | |
|-----------------------|---|
| F01023 | Software timeout (internal) |
| Message class: | Hardware/software error (1) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY |
| Cause | An internal software timeout has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. |
| Remedy | - Carry out a POWER ON (switch-off/switch-on) for all components. - Upgrade firmware to later version. - Contact Technical Support. |

| | |
|-----------------------|--|
| A01028 (F) | Configuration error |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The parameterization that was downloaded was generated with a different module type (Order No., MLFB). |
| Remedy | Save parameters in a non-volatile fashion (p0971 = 1). |

| | |
|-----------------------|---|
| F01030 | Sign-of-life failure for master control |
| Message class: | Communication error to the higher-level control system (9) |
| Reaction: | OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2) |
| Acknowledge: | IMMEDIATELY |
| Cause | For active PC master control, no sign-of-life was received within the monitoring time. The master control was returned to the active BICO interconnection. |
| Remedy | Set the monitoring time higher at the PC or, if required, completely disable the monitoring function. For the commissioning software, the monitoring time is set as follows: <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds. Notice: The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails! |

| | |

| F01033 | Units changeover: Reference parameter value invalid |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY |

Cause When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0
Fault value (r0949, parameter):
Reference parameter whose value is 0.0.
See also: p0505 (Selecting the system of units), p0595 (Technological unit selection)

Remedy Set the value of the reference parameter to a number different than 0.0.
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

F01034 Units changeover: Calculation parameter values after reference value change unsuccessful

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY

Cause The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored.
Fault value (r0949, parameter):
Parameter whose value was not able to be re-calculated.
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

Remedy - Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation.
- Technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

A01035 (F) ACX: Parameter back-up file corrupted

Message class: Hardware/software error (1)
Reaction: NONE
Acknowledge: NONE

Cause When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out.
It is possible that the backup was interrupted by switching off or withdrawing the memory card.
Alarm value (r2124, interpret hexadecimal):
ddccbbaa hex:
aa = 01 hex:
Power up was realized without data backup. The drive is in the factory setting.
aa = 02 hex:
The last available internal backup data record was loaded. The parameterization must be checked. It is recommended that the parameterization is downloaded again.
aa = 03 hex:
The last available data record from the memory card was loaded. The parameterization must be checked.
aa = 04 hex:
An invalid data backup was loaded from the memory card into the drive. The drive is in the factory setting.
dd, cc, bb:
Only for internal Siemens troubleshooting.
See also: p0971 (Save parameters)

Remedy - Download the project again with the commissioning software.
- Save all parameters (p0971 = 1 or "copy RAM to ROM").

Fatal error at project download

| | |
|-----------------------|---|
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | OFF2 (OFF1, OFF3) |
| Acknowledge: | IMMEDIATELY |
| Cause | <p>A fatal error was detected when downloading a project using the commissioning software.</p> <p>Fault value (r0949, interpret decimal):</p> <p>1: Device status cannot be changed to Device Download (drive object ON?).</p> <p>2: Incorrect drive object number.</p> <p>8: Maximum number of drive objects that can be generated exceeded.</p> <p>11: Error while generating a drive object (global component).</p> <p>12: Error while generating a drive object (drive component).</p> <p>13: Unknown drive object type.</p> <p>14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).</p> <p>15: Drive status cannot be changed to drive download.</p> <p>16: Device status cannot be changed to "ready for operation".</p> <p>18: A new download is only possible if the factory settings are restored for the drive unit.</p> <p>20: The configuration is inconsistent.</p> <p>21: Error when accepting the download parameters.</p> <p>22: SW-internal download error.</p> <p>100: The download was canceled, because no write requests were received from the commissioning client (e.g. for communication error).</p> <p>Additional values:</p> <p>Only for internal Siemens troubleshooting.</p> |

- Remedy**
- Use the current version of the commissioning software.
 - Modify the offline project and download again (e.g. compare the motor and Power Module in the offline project and on the drive).
 - Change the drive state (is a drive rotating or is there a message/signal?).
 - Carefully note any other messages/signals and remove their cause.
 - Boot from previously saved files (switch-off/switch-on or p0970).

F01044 CU: Descriptive data error

Message class: Hardware/software error (1)
Reaction: OFF2
Acknowledge: POWER ON
Cause An error was detected when loading the descriptive data saved in the non-volatile memory.
Remedy Replace the memory card or Control Unit.

A01045 Configuring data invalid

Message class: Hardware/software error (1)
Reaction: NONE
Acknowledge: NONE
Cause An error was detected when evaluating the parameter files PSxxxxxy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.
 Alarm value (r2124, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy - Check the parameters displayed in r9406 up to r9408, and correct these if required.
 - Restore the factory setting using (p0970 = 1) and re-load the project into the drive unit.
 Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0971 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.
 See also: r9406 (PS file parameter number parameter not transferred), r9407 (PS file parameter index parameter not transferred), r9408 (PS file fault code parameter not transferred)

A01049 It is not possible to write to file

Message class: Hardware/software error (1)
Reaction: NONE
Acknowledge: NONE
Cause It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted.
 Alarm value (r2124, interpret decimal):
 Drive object number.
Remedy Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/... When required, remove write protection and save again (e.g. set p0971 to 1).

F01054 CU: System limit exceeded

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause At least one system overload has been identified.
 Fault value (r0949, interpret decimal):
 1: Computing time load too high (r9976[1]).
 5: Peak load too high (r9976[5]).
 Note:
 As long as this fault is present, it is not possible to save the parameters (p0971).
 See also: r9976 (System utilization)

4 Faults and alarms

4.2 List of faults and alarms

Remedy For fault value = 1, 5:

- Reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %.
- Check the sampling times and adjust if necessary (p0115, p0799, p4099).
- Deactivate function modules.
- Deactivate drive objects.
- Remove drive objects from the target topology.
- Note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:

- The computing time load of the individual runtime groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- If necessary, the assignment of the runtime group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- If necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

A01064 (F) CU: Internal error (CRC)

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause A checksum error (CRC error) has occurred in the Control Unit program memory

Remedy

- Carry out a POWER ON (switch-off/switch-on) for all components.
- Upgrade firmware to later version.
- Contact Technical Support.

A01066 Buffer memory: 70% fill level reached or exceeded

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: NONE

Cause The non-volatile buffer memory for parameter changes is filled to at least 70%.
This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.

Remedy If required, deactivate and clear the buffer memory (p0014 = 0).
If required, clear the buffer memory (p0014 = 2).
In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared:

- p0971 = 1
- Switch-off/switch-on Control Unit

A01067 Buffer memory: 100 % fill level reached

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: NONE

Cause The non-volatile buffer memory for parameter changes is filled to 100%.
All additional parameter changes will no longer be taken into account in the non-volatile buffer memory. However, parameter changes can still be made in the volatile memory (RAM).
This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.

Remedy If required, deactivate and clear the buffer memory (p0014 = 0).
If required, clear the buffer memory (p0014 = 2).
In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared:

- p0971 = 1
- Switch-off/switch-on Control Unit

F01068 CU: Data memory memory overflow

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause The utilization for a data memory area is too large.
Fault value (r0949, interpret binary):
Bit 0 = 1: High-speed data memory 1 overloaded
Bit 1 = 1: High-speed data memory 2 overloaded
Bit 2 = 1: High-speed data memory 3 overloaded
Bit 3 = 1: High-speed data memory 4 overloaded

Remedy

- Deactivate the function module.
- Deactivate drive object.
- Remove the drive object from the target topology.

A01069 **Parameter backup and device incompatible**

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE

Cause The parameter backup on the memory card and the drive unit do not match.
The module boots with the factory settings.
Example:
Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.

Remedy

- Insert a memory card with compatible parameter backup and carry out a POWER ON.
- Insert a memory card without parameter backup and carry out a POWER ON.
- If required, withdraw the memory card and carry out POWER ON.
- Save the parameters (p0971 = 1).

F01072 **Memory card restored from the backup copy**

Message class: General drive fault (19)
Reaction: NONE
Acknowledge: IMMEDIATELY

Cause The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.
After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.

Remedy Check that the firmware and parameterization is up-to-date.

A01073 (N) **POWER ON required for backup copy on memory card**

Message class: General drive fault (19)
Reaction: NONE
Acknowledge: NONE

Cause The parameter assignment on the visible partition of the memory card has changed.
In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.
Note:
It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

Remedy

- Carry out a POWER ON (power off/on) for the Control Unit.
- Carry out a hardware reset (RESET button, p0972).

N01101 (A) **CU: memory card not available**

Message class: Hardware/software error (1)
Reaction: NONE
Acknowledge: NONE

Cause The memory card is not available for the drive.

Remedy Insert a memory card.
If Starter is not active, interrupt the USB connection to the PC

Remedy

- Check the DRIVE-CLiQ wiring.
- Reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.

For fault value = 1yy - 4yy in addition:

- Increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the runtime group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.
- If necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).
- Reduce the function modules (r0108).
- Establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).
- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.

For fault value = 8yy in addition:

- Check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.

For fault value = 9yy in addition:

- Check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

F01505 (A) BICO: Interconnection cannot be established

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause A PROFIdrive telegram has been set (p0922).
 An interconnection contained in the telegram was not able to be established.
 Fault value (r0949, interpret decimal):
 Parameter receiver that should be changed.

Remedy Establish another interconnection.

F01510 BICO: Signal source is not float type

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause The requested connector output does not have the correct data type. This interconnection is not established.
 Fault value (r0949, interpret decimal):

Remedy Interconnect this connector input with a connector output having a float data type.

F01511 (A) BICO: Interconnection with different scalings

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.
 - The BICO output has different normalized units than the BICO input.
 - Message only for interconnections within a drive object.
 Example:
 The BICO output has, as normalized unit, voltage and the BICO input has current.
 This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.
 p2002: contains the reference value for current
 p2001: contains the reference value for voltage
 Fault value (r0949, interpret decimal):
 Parameter number of the BICO input (signal sink).

Remedy Not necessary.

| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY |
| Cause | The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor $p2002/p2001$ is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor $p2001(DO1)/p2001(DO2)$ is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2 Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink). |

Remedy

For fault values 1 ... 999 described in "Cause":

- Check the cross data comparison that resulted in a STOP F.
- Carry out a POWER ON (switch-off/switch-on).

For fault value = 1000:

- Check the wiring of the F-DI (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- Check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- Carry out a POWER ON (switch-off/switch-on).

For fault value = 1950, 1951:

- Operate the Control Unit in the permissible temperature range.
- Replace Control Unit.

For fault value = 2000, 2001, 2002, 2003:

- Check the discrepancy time, and if required, increase the value (p9650/p9850).
- Check the wiring of the F-DI (contact problems).
- Check the causes of the STO selection in r9772. When SI Motion functions are active (p9501 = 1), STO can also be selected using these functions.

For fault value = 6000:

- Carry out a POWER ON (switch-off/switch-on).
- Upgrade firmware to later version.
- Contact Technical Support.
- Replace Control Unit.

For fault value = 6064:

- Check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe device.
- Check the setting of the PROFIsafe address on processor 1 (p9610) and on processor 2 (p9810).

For fault value = 6065:

- Check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe device. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- Check the setting of the value in F-parameter F_Source_Add at the PROFIsafe device. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- Check the setting of the value in the F parameter F_WD_Time at the PROFIsafe device. It is not permissible for the watch time to be 0!

For fault value = 6068:

- Check the setting of the value in F parameter F_SIL at the PROFIsafe device. The SIL level must correspond to SIL2!

For fault value = 6069:

- Check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe device. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- Check the setting of the value in the F parameter F_Par_Version at the PROFIsafe device. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- Check the setting of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe device and update if necessary.

For fault value = 6072:

- Check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- If the fault occurs after powering up or after inserting the PROFIBUS/PROFINET cable, acknowledge the fault.
- Check the configuration and communication at the PROFIsafe device.
- Check the setting of the value for F parameter F_WD_Time at the PROFIsafe device and increase if necessary.
- Check whether all F parameters of the drive match the F parameters of the F host.

4 Faults and alarms

4.2 List of faults and alarms

For fault value = 6166:

- Check the configuration and communication at the PROFIsafe device.
- Check the setting of the value for F parameter F_WD_Time at the PROFIsafe device and increase if necessary.
- Evaluate diagnostic information in the F host.
- Check PROFIsafe connection.
- Check whether all F parameters of the drive match the F parameters of the F host.

For fault values that are described in "Cause":

- Carry out a POWER ON (switch-off/switch-on).
- Contact Technical Support.
- Replace Control Unit.

F01661 SI P1 (CU): Simulation of the safety inputs active

Message class: General drive fault (19)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause The simulation of the digital inputs of the Control Unit (p0795) is active.
It is not permissible that safety inputs are simulated.
Fault value (r0949, interpret binary):
The displayed bits indicate which digital inputs must not be simulated.

Remedy - deactivate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795).
- acknowledge fault.

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: POWER ON

Cause A module-internal communication error has occurred.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.

Remedy - Carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check whether an impermissible voltage is connected at one of the digital outputs.
- check whether a digital output is loaded with an impermissible current.
- Upgrade firmware to later version.
- Contact Technical Support.

F01663 SI P1 (CU): Copying the SI parameters rejected

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause In p9700, the value 87 or 208 is saved or was entered offline.
This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from processor 1 to processor 2. However, no safety-relevant function has been selected on processor 1 (p9501 = 0, p9601 = 0). This is the reason that copying is not possible.

Note:

This fault does not result in a safety stop response.

SI: Safety Integrated

See also: p9700 (SI copy function)

Remedy - set p9700 to 0.
- check p9501 and/or p9601 and if required, correct.
- restart the copying function by entering the corresponding value into p9700.

Fault value (r0949, interpret hexadecimal):

200000 hex, 400000 hex, 8000yy hex (yy any):

- fault in the actual booting/operation.

Additional values:

- defect before the last time that the system booted.

4 Faults and alarms

A01666 (F) SI Motion P1 (CU): Steady-state (static) 1 signal at the F-DI for safe acknowledgment

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause

A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds.

If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

Remedy

Set the Failsafe Digital Input (F-DI) to a logical 0 signal (p10006).

Note:

F-DI: Failsafe Digital Input

A01669 (F, N) SI Motion: Unfavorable combination of motor and power unit

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause

The combination of motor and power unit used is not suitable for using safe motion monitoring functions without an encoder.

The ratio between the power unit rated current (r0207[0]) and rated motor current (p0305) is greater than 5.

Alarm value (r2124, interpret decimal):

Number of the motor data set, which caused the fault.

Notice:

If this alarm is not observed, then message C01711 or C30711 – with the value 1041 ... 1044 – can sporadically occur.

Remedy

Use a suitable power unit with a lower power rating or a motor with a higher power rating.

F01680 SI Motion P1 (CU): Checksum error safety monitoring functions

Message class: Safety monitoring channel has identified an error (10)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause

The actual checksum calculated by the drive and entered in r9728 via the safety-relevant parameters does not match the reference checksum saved in p9729 at the last machine acceptance.

Safety-relevant parameters have been changed or a fault is present.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

0: Checksum error for SI parameters for motion monitoring.

1: Checksum error for SI parameters for actual values.

2: Checksum error for SI parameters for component assignment.

Remedy

- check the safety-relevant parameters and if required, correct.
- execute the function "Copy RAM to ROM".
- perform a POWER ON if safety parameters requiring a POWER ON have been modified.
- carry out an acceptance test.

A01696 (F) SI Motion: Test stop for the motion monitoring functions selected when booting

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Cause The forced checking procedure (test stop) for the safe motion monitoring functions is already selected when booting, which is not permissible.

This is the reason that the test is only carried out again after first selecting the forced checking procedure.

Note:

This message does not result in a safety stop response.

See also: p9705 (SI Motion: Test stop signal source)

Remedy De-select the forced checking procedure of the safety motion monitoring functions and then select again.

A01697 (F) SI Motion: Test stop for motion monitoring functions required

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: NONE

Cause The time set in p9559 for the forced checking procedure (test stop) for the safe motion monitoring functions has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

Note:

- This message does not result in a safety stop response.

- As the switch-off signal paths are not automatically checked during booting, an alarm is always issued once booting is complete.

- the test must be performed within a defined, maximum time interval (p9559, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p9559 (SI Motion forced checking procedure timer (processor 1)), r9765 (SI Motion forced checking procedure remaining time (processor 1))

Remedy Carry out the forced checking procedure of the safety motion monitoring functions.

A01706 SI Motion P1 (CU): SAM/SBR limit exceeded

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: NONE

Cause

Motion monitoring functions with set acceleration monitoring (SAM, p9506 = 3):

- after initiating STOP B (SS1) the velocity has exceeded the selected tolerance.

Motion monitoring functions with set brake ramp monitoring (SBR, p9506 = 1):

- after initiating STOP B (SS1) or SLS changeover to the lower speed level, the speed has exceeded the selected tolerance.

The drive is shut down by the message C01700 "SI Motion: STOP A initiated".

Remedy

Check the braking behavior and, if necessary, adapt the parameterization of the parameter settings of the "SAM" or the "SBR" function.

A01711 SI Motion P1 (CU): Defect in a monitoring channel

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: NONE

Cause

When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then message C01701 "SI Motion: STOP B initiated" is output.

The message value that resulted in a STOP F is displayed in r9725. The message values described involve the data cross-check between processor 1 and processor 2.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- synchronization error between processor 1 and processor 2.

Message value (r2124, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

0: Stop request from the other monitoring channel.

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (12 ms).

SI Motion P1 (CU): Discrepancy error of the failsafe inputs

| | |
|-----------------------|--|
| Message class: | Safety monitoring channel has identified an error (10) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY (POWER ON) |
| Cause | The Failsafe Digital Inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret binary): Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs. |

Remedy

- Check the wiring of the F-DI (contact problems).

Note:
This message can be acknowledged via F-DI or PROFIsafe.
Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.
When the "Extended message acknowledgment" function (p9507.0) is active, the following applies:
If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.
For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.
If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:

- $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
- $p10002 \geq 12 \text{ ms}$ (discrepancy time must be no less than 12 ms)
- $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms.
 tp = period for a switching operation in ms.
When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.
If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10002 < p10017 + 1 \text{ ms} - td$
- $p10002 > td$
- $p10002 \geq 12 \text{ ms}$

Example:
For a 110 ms switching frequency and $p10017 = 0$, the maximum discrepancy time that can be set is as follows:
 $p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$
Rounded off, $p10002 \leq 36 \text{ ms}$ is obtained (as the discrepancy time is rounded off as a multiple of 12 ms).

|--------------|--|

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy

Check the wiring of the Failsafe Digital Output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.
- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

SI Motion P1 (CU): Test stop for Failsafe Digital Outputs required

Message class:

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

NONE

Cause

The time set in p10003 for the forced checking procedure (test stop) for the Failsafe Digital Outputs has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

Note:

- This message does not result in a safety stop response.
- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p10003 (SI Motion forced checking procedure timer)

Remedy

Carry out the forced checking procedure for the digital outputs.

The signal source to select the forced checking procedure is set via binector input p10007.

Message class:

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

NONE

Cause

The automatic test stop (forced checking procedure) was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via safe motion monitoring functions.
- a safety message is present, that resulted in a STO.

Note:

STO: Safe Torque Off

Remedy

- deselect STO via safe motion monitoring functions.
- remove the cause of the safety messages and acknowledge the messages.

Note:

The automatic test stop is performed after removing the cause.

| F01910 (N, A) | Fieldbus interface setpoint timeout |
| Message class: | Communication error to the higher-level control system (9) |
| Reaction: | OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2) |
| Acknowledge: | IMMEDIATELY |
| Cause | The reception of setpoints from the fieldbus interface has been interrupted. - bus connection interrupted. - communication partner switched off. For PROFIBUS: - PROFIBUS master set into the STOP state. See also: p2047 (PROFIBUS additional monitoring time) |
| Remedy | Ensure bus connection has been established and switch on communication partner. - if required, adapt p2040. For PROFIBUS: - set the PROFIBUS master to the RUN state. - if the error is repeated, check the set response monitoring in the bus configuration (HW Config). - Device redundancy: When operated on a Y-Link, it must be ensured that "DP alarm mode = DPV1" is set in the device parameterization. |

| F02080 | Trace: Parameterization deleted due to unit changeover |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY |
| Cause | The trace parameterization in the drive unit was deleted due to a unit changeover or a change in the reference parameters. |

Remedy Restart trace.

A02095 MTrace 0: multiple trace cannot be activated

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 0):

- measuring function
- long-time trace
- trigger condition "immediate recording start" (IMMEDIATE)
- trigger condition "start with function generator" (FG_START)

Remedy

- if required, deactivate the multiple trace (p4840[0] = 0).
- deactivate function or setting that is not permissible

A02096 MTrace 0: cannot be saved

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0).
A multiple trace is not started or is canceled.
Alarm value (r2124, interpret decimal):

- 1: Memory card cannot be accessed.

- card is not inserted or is blocked by a mounted USB drive.
- 3: data save operation too slow.
- a second trace has been completed before the measurement results of the first trace were able to be saved.
- writing the measurement result files to the card is blocked by the parameter save.
- 4: Data save operation canceled.
- for instance, the file required for the data save operation was not able to be found.

Remedy

- insert or remove the memory card.
- use a larger memory card.
- configure a longer trace time or use an endless trace.
- avoid saving parameters while a multiple trace is running.
- check whether other functions are presently accessing measurement result files.

A02097 MTrace 1: multiple trace cannot be activated

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

| Cause | An internal software error has occurred within an OA application. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting. |

Remedy

- Carry out a POWER ON (switch-off/switch-on) for all components.
- Upgrade firmware to later version.
- Contact Technical Support.
- Replace the Control Unit.

Note:
OA: Open Architecture

F02152 (A) OA: Insufficient memory

Message class: Hardware/software error (1)
Reaction: OFF1
Acknowledge: IMMEDIATELY (POWER ON)
Cause Too many functions have been configured on this Control Unit (e.g. too many drives, function modules, data sets, OA applications, blocks, etc.).
Fault value (r0949, interpret decimal):

| Acknowledge: | IMMEDIATELY |
| Cause | KTY84/PT1000: The motor temperature has exceeded the fault threshold (p0605) or the timer (p0606) after the alarm threshold was exceeded (p0604) has expired. The response parameterized in p0610 becomes active. The alarm is withdrawn if the response threshold for wire breakage or sensor not connected is exceeded ($R > 2120 \text{ Ohm}$). PTC or bimetallic NC contact: The response threshold of 1650 Ohm was exceeded or the NC contact opened and the timer (p0606) has expired. The response parameterized in p0610 becomes active. Possible causes: - motor is overloaded. - motor ambient temperature too high. - wire breakage or sensor not connected. Fault value (r0949, interpret decimal): 200: Motor temperature model 1 (I2t): temperature too high. See also: p0604, p0605, p0606, p0612, p0613, p0625, p0626, p0627, p0628 |

Remedy

- reduce the motor load.
- check the ambient temperature and the motor ventilation.
- check the wiring and the connection of the PTC or bimetallic NC contact.

Alarm value (r2124, interpret decimal):

1:

All motor temperature models: It is not possible to save the model temperature

See also: p0610 (Motor overtemperature response)

Remedy

- set the response for motor overtemperature to "Alarm and fault, no reduction of I_{max}" (p0610 = 2).

A07015 Drive: Motor temperature sensor alarm

Message class: External measured value / signal state outside the permissible range (16)

Reaction: NONE

Acknowledge: NONE

Cause An error was detected when evaluating the temperature sensor set in p0601.

With the fault, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.

Possible causes:

- wire breakage or sensor not connected (KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

4 Faults and alarms

4.2 List of faults and alarms

Remedy

- make sure that the sensor is connected correctly.
- check the parameterization (p0601).

Drive: Motor temperature sensor fault

Message class: External measured value / signal state outside the permissible range (16)

Reaction: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause An error was detected when evaluating the temperature sensor set in p0601.

Possible causes:

- wire breakage or sensor not connected (KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

Note:

If alarm A07015 is present, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.

Macro: Execution not possible

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause The macro cannot be executed.
 Fault value (r0949, interpret hexadecimal):
 ccccbbaa hex:
 cccc = preliminary parameter number, bb = supplementary information, aa = fault cause
 Fault causes for the trigger parameter itself:
 19: Called file is not valid for the trigger parameter.
 20: Called file is not valid for parameter 15.
 21: Called file is not valid for parameter 700.
 22: Called file is not valid for parameter 1000.
 23: Called file is not valid for parameter 1500.
 24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16).
 Fault causes for the parameters to be set:
 25: Error level has an undefined value.
 26: Mode has an undefined value.
 27: A value was entered as string in the tag value that is not "DEFAULT".
 31: Entered drive object type unknown.
 32: A device was not able to be found for the determined drive object number.
 34: A trigger parameter was recursively called.
 35: It is not permissible to write to the parameter via macro.
 36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect.
 37: Source parameter for a BICO interconnection was not able to be determined.
 38: An index was set for a non-indexed (or CDS-dependent) parameter.
 39: No index was set for an indexed parameter.
 41: A bit operation is only permissible for parameters with the parameter format DISPLAY_BIN.
 42: A value not equal to 0 or 1 was set for a BitOperation.
 43: Reading the parameter to be changed by the BitOperation was unsuccessful.
 51: Factory setting for DEVICE may only be executed on the DEVICE.
 61: The setting of a value was unsuccessful.

Remedy
 - check the parameter involved.
 - check the macro file and BICO interconnection.

F07083 Macro: ACX file not found
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause The ACX file (macro) to be executed was not able to be found in the appropriate directory.
 Fault value (r0949, interpret decimal):
 Parameter number with which the execution was started.
 See also: p0015, p1000, p1500
Remedy - check whether the file is saved in the appropriate directory on the memory card.

F07084 Macro: Condition for WaitUntil not fulfilled
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause The WaitUntil condition set in the macro was not fulfilled in a certain number of attempts.
 Fault value (r0949, interpret decimal):
 Parameter number for which the condition was set.
Remedy Check and correct the conditions for the WaitUntil loop.

A07200 Drive: Master control ON command present

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause The ON/OFF1 command is present (no 0 signal).

The command is either influenced via binector input p0840 (current CDS) or control word bit 0 via the master control.

Remedy Switch the signal via binector input p0840 (current CDS) or control word bit 0 via the master control to 0.

F07220 (N, A) Drive: Master control by PLC missing

Message class: Communication error to the higher-level control system (9)

Reaction: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause The "master control by PLC" signal was missing in operation.

- Interconnection of the binector input for "master control by PLC" is incorrect (p0854).
- The higher-level control has withdrawn the "master control by PLC" signal.
- Data transfer via the fieldbus (higher-level control/drive) was interrupted.

Remedy - Check the interconnection of the binector input for "master control by PLC" (p0854).

- Check the "master control by PLC" signal and, if required, switch in.

- Check the data transfer from the higher-level control system to the drive via the fieldbus.

Note:

If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

F07300 (A) Drive: Line contactor feedback signal missing

Message class: Auxiliary unit faulted (20)

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

- Cause**
- the line contactor was not able to be closed within the time in p0861.
 - the line contactor was not able to be opened within the time in p0861.
 - the line contactor dropped out during operation
 - the line contactor has closed although the drive converter is switched off.

Remedy - check the setting of p0860.

- check the feedback circuit from the line contactor.

- increase the monitoring time in p0861.

See also: p0860 (Line contactor feedback signal), p0861 (Line contactor monitoring time)

F07320 Drive: Automatic restart interrupted

Message class: Application/technological function faulted (17)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause - the specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt.

- the monitoring time for the power unit has expired (p0857).

- when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically switched on again.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

Remedy - increase the number of restart attempts (p1211). The actual number of starting attempts is displayed in r1214.

- increase the delay time in p1212 and/or the monitoring time in p1213.

- either increase or disable the monitoring time of the power unit (p0857).

- reduce the delay time to reset the start counter (p1213[1]) so that fewer faults are registered in the time interval.

4.2 List of faults and alarms

| | |
|-----------------------|--|
| A07321 | Drive: Automatic restart active |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate. For p1210 = 26, restarting is realized with the delayed setting of the ON command. |
| Remedy | - the automatic restart (AR) should, if required, be inhibited (p1210 = 0). - an automatic restart can be directly interrupted by withdrawing the switch-on command (BI: p0840). - for p1210 = 26: by withdrawing the OFF2- / OFF3 command. |

| F07331 | Flying restart: Function not supported |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | OFF2 (NONE, OFF1) |
| Acknowledge: | IMMEDIATELY |
| Cause | It is not possible to power up with the motor rotating (no flying restart). In the following cases, the "flying restart" function is not supported: PMSM: operation with U/f characteristic and sensorless vector control. Note: PMSM: permanent-magnet synchronous motor |
| Remedy | Deactivate the "flying restart" function (p1200 = 0). |

| | |
|-----------------------|---|
| F07332 | Flying restart: maximum speed reduced |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | OFF2 (NONE, OFF1) |
| Acknowledge: | IMMEDIATELY |
| Cause | The maximum speed that can be reached is reduced; at very high speeds problems associated with the flying restart can be encountered. Possible causes: - power ratio, power unit/motor too high |
| Remedy | Parameter changes are not required. Note: A flying restart at speeds above 3000 rpm should be avoided. |

| | |
|-----------------------|---|
| A07352 | Drive: Limit switch signals not plausible |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | Limit switch signals are not plausible. Possible causes: - BICO interconnections are not OK (p3342, p3343). - sensors are not supplying a valid signal (both supply a 0 signal). |
| Remedy | - check the BICO interconnections for the limit switch signals. - check the sensors. See also: p3342 (Limit switch plus), p3343 (Limit switch minus) |

F07435 (N) Drive: Setting the ramp-function generator for sensorless vector control
Message class: Application/technological function faulted (17)
Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen.
Remedy - deactivate the holding command for the ramp-function generator (p1141).
 - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

A07440 EPOS: Jerk time is limited
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms.
Note:
 The alarm is also output if jerk limiting is not active.
Remedy - increase the jerk limiting (p2574).
 - reduce maximum acceleration or maximum deceleration (p2572, p2573).
 See also: p2572 (EPOS maximum acceleration), p2573 (EPOS maximum deceleration), p2574 (EPOS jerk limiting)

A07441 LR: Save the position offset of the absolute encoder adjustment
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause The status of the absolute encoder adjustment has changed.
 In order to permanently save the determined position offset (p2525) it must be saved in a non-volatile fashion (p0971).
Remedy Not necessary.
 This alarm automatically disappears after the offset has been saved.

F07442 (A) LR: Multiturn does not match the modulo range
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.
 This results in the adjustment being set back, as the position actual value cannot be reproduced after switch-off/switch-on.
Remedy Make the ration between the multiturn resolution and the modulo range an integer number.
 The ratio v is calculated as follows:
 1. Motor encoder

$$v = (p0421 * p2506 * p2505) / (p2504 * p2576)$$

 2. Direct encoder

$$v = (p0421 * p2506) / p2576$$

| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | One of the following problems has occurred with the position actual value preprocessing: <ul style="list-style-type: none"> - an encoder is not assigned for the position actual value preprocessing (p2502 = 0). - an encoder an an encoder data set have been assigned, however, the encoder data set does not contain any encoder data (p0400 = 0) or invalid data (e.g. p0408 = 0). |
| Remedy | Check the drive data sets, encoder data sets and encoder assignment. See also: p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0400 (Encoder type selection), p2502 (LR encoder assignment) |
| A07455 | EPOS: Maximum velocity limited |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The maximum velocity (p2571) is too high to correctly calculate the modulo correction. Within the sampling time for positioning (8 ms), with the maximum velocity, a maximum of the half modulo length must be moved through. p2571 was limited to this value. |
| Remedy | Reduce the maximum velocity (p2571). |
| A07456 | EPOS: Setpoint velocity limited |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The actual setpoint velocity is greater than the parameterized maximum velocity (p2571) and is therefore limited. |
| Remedy | <ul style="list-style-type: none"> - check the entered setpoint velocity. - reduce the velocity override (CI: p2646). - increase the maximum velocity (p2571). - check the signal source for the externally limited velocity (CI: p2594). |
| A07457 | EPOS: Combination of input signals illegal |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | An illegal combination of input signals that are simultaneously set was identified. Alarm value (r2124, interpret decimal): 0: Jog 1 and jog 2 (p2589, p2590). 1: Jog 1 or jog 2 and direct setpoint input/MDI (p2589, p2590, p2647). 2: Jog 1 or jog 2 and start referencing (p2589, p2590, p2595). 3: Jog 1 or jog 2 and activate traversing task (p2589, p2590, p2631). 4: Direct setpoint input/MDI and starting referencing (p2647, p2595). 5: Direct setpoint input/MDI and activate traversing task (p2647, p2631). 6: Start referencing and activate traversing task (p2595, p2631). |
| Remedy | Check the appropriate input signals and correct. |
| F07458 | EPOS: Reference cam not found |
| Message class: | Application/technological function faulted (17) |
| Reaction: | OFF1 (OFF2, OFF3) |
| Acknowledge: | IMMEDIATELY |
| Cause | After starting the search for reference, the axis moved through the maximum permissible distance to search for the reference cam without actually finding the reference cam. |

4 Faults and alarms

4.2 List of faults and alarms

Remedy

- check the "reference cam" binector input (BI: p2612).
- check the maximum permissible distance to the reference cam (p2606).
- if axis does not have any reference cam, then set p2607 to 0.

See also: p2606 (EPOS search for reference reference cam maximum distance), p2607 (EPOS search for reference reference cam present), p2612 (EPOS search for reference reference cam)

F07459 EPOS: No zero mark

Message class: Application/technological function faulted (17)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause After leaving the reference cam, the axis has traversed the maximum permissible distance between the reference cam and zero mark without finding the zero mark.
Remedy

- check the encoder regarding the zero mark
- check the maximum permissible distance between the reference cam and zero mark (p2609).
- use an external encoder zero mark (equivalent zero mark) (p0494).

See also: p0494 (Equivalent zero mark input terminal), p2609 (EPOS search for reference max distance ref cam and zero mark)

F07460 EPOS: End of reference cam not found

Message class: Application/technological function faulted (17)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause During the search for reference, when the axis reached the zero mark it also reached the end of the traversing range without detecting an edge at the binector input "reference cam" (BI: p2612).
Maximum traversing range: -2147483648 [LU] ... -2147483647 [LU]
Remedy

- check the "reference cam" binector input (BI: p2612).
- repeat the search for reference.

See also: p2612 (EPOS search for reference reference cam)

A07461 EPOS: Reference point not set

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause When starting a traversing block/direct setpoint input, a reference point is not set (r2684.11 = 0).
Remedy Reference the system (search for reference, flying referencing, set reference point).

A07462 EPOS: Selected traversing block number does not exist

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause A traversing block selected via binector input p2625 ... p2630 was started via binector input p2631 = 0/1 edge "Activate traversing task".

- the number of the started traversing block is not contained in p2616[0...n].
- the started traversing block is suppressed.

Alarm value (r2124, interpret decimal):
Number of the selected traversing block that is also not available.
Remedy

- correct the traversing program.
- select an available traversing block number.

A07463 (F) EPOS: External block change not requested in the traversing block

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause For a traversing block with the block change enable CONTINUE_EXTERNAL_ALARM, the external block change was not requested.
Alarm value (r2124, interpret decimal):
Number of the traversing block.

Remedy Resolve the reason as to why the edge is missing at binector input (BI: p2632).

F07464 EPOS: Traversing block is inconsistent

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF1 (OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause The traversing block does not contain valid information.
Fault value (r0949, interpret decimal):
Number of the traversing block with invalid information.

Remedy Check the traversing block and where relevant, take into consideration alarms that are present.

A07465 EPOS: Traversing block does not have a subsequent block

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause There is no subsequent block in the traversing block.
Alarm value (r2124, interpret decimal):
Number of the traversing block with the missing subsequent block.

Remedy - parameterize this traversing block with the block change enable END.
- parameterize additional traversing blocks with a higher block number and for the last block, using the block change enable END.

A07466 EPOS: Traversing block number assigned a multiple number of times

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause The same traversing block number was assigned a multiple number of times.
Alarm value (r2124, interpret decimal):
Number of the traversing block that was assigned a multiple number of times.

Remedy Correct the traversing blocks.

A07467 EPOS: Traversing block has illegal task parameters

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause The task parameter in the traversing block contains an illegal value.
Alarm value (r2124, interpret decimal):
Number of the traversing block with an illegal task parameter.

Remedy Correct the task parameter in the traversing block.

A07468 EPOS: Traversing block jump destination does not exist

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause In a traversing block, a jump was programmed to a non-existent block.
Alarm value (r2124, interpret decimal):
Number of the traversing block with a jump destination that does not exist.

Remedy - correct the traversing block.
- add the missing traversing block.

A07469 EPOS: Traversing block < target position < software limit switch minus

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

| A07472 | EPOS: Traversing block ABS_POS/ABS_NEG not possible |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | In the traversing block the positioning mode ABS_POS or ABS_NEG were parameterized with the modulo correction not activated. Alarm value (r2124, interpret decimal): Number of the traversing block with the illegal positioning mode. |
| Remedy | Correct the traversing block. |

| | |
|-----------------------|--|
| A07473 (F) | EPOS: Beginning of traversing range reached |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | When traversing, the axis has moved to the traversing range limit. |
| Remedy | Move away in the positive direction. |

| | |
|-----------------------|--|
| A07474 (F) | EPOS: End of traversing range reached |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | When traversing, the axis has moved to the traversing range limit. |
| Remedy | Move away in the negative direction. |

| | |

| F07475 (A) | EPOS: Target position < start of traversing range |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | OFF1 (OFF2, OFF3) |
| Acknowledge: | IMMEDIATELY |

Cause The target position for relative traversing lies outside the traversing range.
Remedy Correct the target position.

F07476 (A) **EPOS: Target position > end of the traversing range**
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause The target position for relative traversing lies outside the traversing range.
Remedy Correct the target position.

A07477 (F) **EPOS: Target position < software limit switch minus**
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause In the actual traversing operation, the target position is less than the software limit switch minus.
Remedy - correct the target position.
- change software limit switch minus (CI: p2578, p2580).
See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

A07478 (F) **EPOS: Target position > software limit switch plus**
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause In the actual traversing operation, the target position is greater than the software limit switch plus.
Remedy - correct the target position.
- change software limit switch plus (CI: p2579, p2581).
See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

A07479 **EPOS: Software limit switch minus reached**
Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause The axis is at the position of the software limit switch minus. An active traversing block was interrupted.
Remedy - correct the target position.
- change software limit switch minus (CI: p2578, p2580).
See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

A07480 **EPOS: Software limit switch plus reached**
Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause The axis is at the position of the software limit switch plus. An active traversing block was interrupted.
Remedy - correct the target position.
- change software limit switch plus (CI: p2579, p2581).
See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

F07481 (A) **EPOS: Axis position < software limit switch minus**
Message class: Application/technological function faulted (17)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause The actual position of the axis is less than the position of the software limit switch minus.

4 Faults and alarms

4.2 List of faults and alarms

Remedy

- correct the target position.
- change software limit switch minus (CI: p2578, p2580).

See also: p2578 (EPOS software limit switch minus signal source), p2580 (EPOS software limit switch minus), p2582 (EPOS software limit switch activation)

F07482 (A) EPOS: Axis position > software limit switch plus

Message class: Application/technological function faulted (17)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause The actual position of the axis is greater than the position of the software limit switch plus.
Remedy

- correct the target position.
- change software limit switch plus (CI: p2579, p2581).

See also: p2579 (EPOS software limit switch plus signal source), p2581 (EPOS software limit switch plus), p2582 (EPOS software limit switch activation)

A07483 EPOS: Travel to fixed stop clamping torque not reached

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause The fixed stop in the traversing block was reached without the clamping torque/clamping force having been achieved.
Remedy

- check the maximum torque-generating current (r1533).
- check the torque limits (p1520, p1521).
- check the power limits (p1530, p1531).
- check the BICO interconnections of the torque limits (p1522, p1523, p1528, p1529).

F07484 EPOS: Fixed stop outside the monitoring window

Message class: Application/technological function faulted (17)
Reaction: OFF3 (OFF1, OFF2)
Acknowledge: IMMEDIATELY
Cause In the "fixed stop reached" state, the axis has moved outside the defined monitoring window (p2635).
Remedy

- check the monitoring window (p2635).
- check the mechanical system.

F07485 (A) EPOS: Fixed stop not reached

Message class: Application/technological function faulted (17)
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause In a traversing block with the task FIXED STOP, the end position was reached without detecting a fixed stop.
Remedy

- check the traversing block and locate the target position further into the workpiece.
- check the "fixed stop reached" control signal (p2637).
- if required, reduce the maximum following error window to detect the fixed stop (p2634).

A07486 EPOS: Intermediate stop missing

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause In the modes "traversing blocks" or "direct setpoint input/MDI" at the start of motion, the binector input "no intermediate stop/intermediate stop" (BI: p2640) did not have a 1 signal.
Remedy Connect a 1 signal to the binector input "no intermediate stop/intermediate stop" (BI: p2640) and re-start motion.
See also: p2640 (EPOS intermediate stop (0 signal))

A07487 EPOS: Reject traversing task missing

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause In the modes "traversing blocks" or "direct setpoint input/MDI" at the start of motion, the binector input "do not reject traversing task/reject traversing task" (BI: p2641) does not have a 1 signal.

| | |
|-----------------------|---|
| Remedy | Connect a 1 signal to the binector input "do not reject traversing task/reject traversing task" (BI: p2641) and restart motion. See also: p2641 (EPOS reject traversing task (0 signal)) |
| F07488 | EPOS: Relative positioning not possible |
| Message class: | Application/technological function faulted (17) |
| Reaction: | OFF1 (OFF2, OFF3) |
| Acknowledge: | IMMEDIATELY |
| Cause | In the mode "direct setpoint input/MDI", for continuous transfer (p2649 = 1) relative positioning was selected (BI: p2648 = 0 signal). |
| Remedy | Check the control. |
| A07489 | EPOS: Reference point correction outside the window |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | For the function "flying referencing" the difference between the measured position at the measuring probe and the reference point coordinate lies outside the parameterized window. |
| Remedy | - check the mechanical system. - check the parameterization of the window (p2602). |
| F07490 (N) | EPOS: Enable signal withdrawn while traversing |
| Message class: | Application/technological function faulted (17) |
| Reaction: | OFF1 (OFF2, OFF3) |
| Acknowledge: | IMMEDIATELY |
| Cause | - for a standard assignment, another fault may have occurred as a result of withdrawing the enable signals. - the drive is in the "switching on inhibited" state (for a standard assignment). |
| Remedy | - set the enable signals or check the cause of the fault that first occurred and then result (for a standard assignment). - check the assignment to enable the basic positioning function. |
| F07491 (A) | EPOS: STOP cam minus reached |
| Message class: | Application/technological function faulted (17) |
| Reaction: | OFF3 |
| Acknowledge: | IMMEDIATELY |
| Cause | A 0 signal was detected at binector input BI: p2569, i.e. the STOP cam minus was reached. For a positive traversing direction, the STOP cam minus was reached - i.e. the wiring of the STOP cam is incorrect. See also: p2569 (EPOS STOP cam minus) |
| Remedy | - leave the STOP cam minus in the positive traversing direction and return the axis to the valid traversing range. - check the wiring of the STOP cam. |
| F07492 (A) | EPOS: STOP cam plus reached |
| Message class: | Application/technological function faulted (17) |
| Reaction: | OFF3 |
| Acknowledge: | IMMEDIATELY |
| Cause | A 0 signal was detected at binector input BI: p2570, i.e. the STOP cam plus was reached. For a negative traversing direction, the STOP cam plus was reached - i.e. the wiring of the STOP cam is incorrect. See also: p2570 (EPOS STOP cam plus) |
| Remedy | - leave the STOP cam plus in the negative traversing direction and return the axis to the valid traversing range. - check the wiring of the STOP cam. |
| F07493 | LR: Overflow of the value range for position actual value |

| A07498 (F) | LR: Measuring probe evaluation not possible |
| Message class: | Application/technological function faulted (17) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | When evaluating the measuring probe, an error occurred. Alarm value (r2124, interpret decimal): 6: The input terminal for the measuring probe is not set. 4098: Error when initializing the measuring probe. 4100: The measuring pulse frequency is too high. > 50000: The measuring clock cycle is not a multiple integer of the position controller clock cycle. |
| Remedy | Deactivate the measuring probe evaluation (BI: p2509 = 0 signal). For alarm value = 6: Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518). For alarm value = 4098: Check the Control Unit hardware. For alarm value = 4100: Reduce the frequency of the measuring pulses at the measuring probe. For alarm value > 50000: Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple. To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows: $T_{meas} [125 \mu s] = \text{alarm value} - 50000$ With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]). Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced. |

4.2 List of faults and alarms

| | |
|---------------|--|
| Cause | The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "absolute encoder adjusted" status is reset. Alarm value (r2124, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value multiplied by the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. |
| Remedy | If required, reduce the traversing range or position resolution. For alarm value = 3: Reducing the position resolution and conversion factor: - reduce the length unit (LU) per load revolution for rotary encoders (p2506). - increase the fine resolution of absolute position actual values (p0419). |

A07594 (F, N) Encoder 2: Value range for position actual value exceeded

Remedy

- check the causes and resolve.
- reset the control (BI: p2508 and BI: p2509 = 0 signal) and activate the requested function.

F07599 (A) Encoder 1: Adjustment not possible

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range (-2147483648 ... 2147483647) for displaying the position actual value.

Remedy If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow.

For rotary encoders, the maximum possible absolute position (LU) is calculated as follows:

1st motor encoder:
 $p2506 * p2505 / p2504$
 $p2506 * p2505 * p0421 / p2504$ for multiturn encoders

2nd direct encoder:

F07754 Drive: Incorrect shutoff valve configuration

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause An incorrect shutoff valve configuration was detected.

Fault value (r0949, interpret decimal):

100:
 Enable Safety Integrated (p9601/p9801), but p0218.0 = 0 (shutoff valve not available).

101:
 The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve ($p0230 < p9625[0]/p9825[0]$).

102:
 The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve ($p0230 < p9625[1]/p9825[1]$).

4 Faults and alarms

4.2 List of faults and alarms

Remedy For fault value = 100:
Check the enable of Safety Integrated and the shutoff valve (p9601/p9801, p0218.0).
For fault value = 101:
Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve (p0230 > p9625[0]/p9825[0]).
For fault value = 102:
Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve (p0230 > p9625[1]/p9825[1]).

F07800 Drive: No power unit present

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause The power unit parameters cannot be read or no parameters are stored in the power unit.

Note:

This fault also occurs if an incorrect topology was selected in the commissioning software and this parameterization is then downloaded to the Control Unit.

See also: r0200 (Power unit code number actual)

Remedy

- Carry out a POWER ON (switch-off/switch-on) for all components.
- check the power unit and replace if necessary.
- check the Control Unit, and if required replace it.
- after correcting the topology, the parameters must be again downloaded using the commissioning software.

F07801 Drive: Motor overcurrent

Message class: Motor overload (8)

Reaction: OFF2 (NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause The permissible motor limit current was exceeded.

- effective current limit set too low.
- current controller not correctly set.
- U/f operation: Up ramp was set too short or the load is too high.
- U/f operation: Short-circuit in the motor cable or ground fault.
- U/f operation: Motor current does not match current of power unit.
- Switch to rotating motor without flying restart function (p1200).

Note:

Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306

Remedy

- check the current limits (p0640).
- vector control: Check the current controller (p1715, p1717).
- U/f control: Check the current limiting controller (p1340 ... p1346).
- increase the up ramp (p1120) or reduce the load.
- check the motor and motor cables for short-circuit and ground fault.
- check the motor for the star-delta configuration and rating plate parameterization.
- check the power unit and motor combination.
- Choose "flying restart" function (p1200) if switched to rotating motor.

F07802 Drive: Infeed or power unit not ready

Message class: Infeed faulted (13)

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause After an internal switch-on command, the infeed or drive does not signal ready.

- monitoring time is too short.
- DC link voltage is not present.
- associated infeed or drive of the signaling component is defective.
- supply voltage incorrectly set.

Remedy

- increase the monitoring time (p0857).
- ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
- replace the associated infeed or drive of the signaling component.
- check the line supply voltage setting (p0210).

A07805 (N) Drive: Power unit overload I2t

Message class: Power electronics faulted (5)
Reaction: NONE
Acknowledge: NONE
Cause Alarm threshold for I2t overload (p0294) of the power unit exceeded.
 The response parameterized in p0290 becomes active.
 See also: p0290 (Power unit overload response)

Remedy

- reduce the continuous load.
- adapt the load duty cycle.
- check the assignment of the motor and power unit rated currents.

F07806 Drive: Regenerative power limit exceeded (F3E)

Message class: Power electronics faulted (5)
Reaction: OFF2 (IASC/DCBRK)
Acknowledge: IMMEDIATELY
Cause For blocksize power units, types PM250 and PM260, the regenerative rated power r0206[2] was exceeded for more than 10 s.
 See also: r0206 (Rated power unit power), p1531 (Power limit regenerative)

Remedy

- increase the down ramp.
- reduce the driving load.
- use a power unit with a higher regenerative feedback capability.
- for vector control, the regenerative power limit in p1531 can be reduced so that the fault is no longer triggered.

F07807 Drive: Short-circuit/ground fault detected

Message class: Ground fault / inter-phase short-circuit detected (7)
Reaction: OFF2 (NONE)

Cause A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.
 Fault value (r0949, interpret decimal):
 1: Short-circuit, phase UV.
 2: Short-circuit, phase UW.
 3: Short-circuit, phase VW.
 4: Ground fault with overcurrent.
 5: Motor cable phase U interrupted
 6: Motor cable phase V interrupted
 7: Motor cable phase W interrupted
 8: Short-circuit with hardware shutdown
 1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase U in per mille).
 2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase V in per mille).

Note:

Also when interchanging the line and motor cables is identified as a motor-side short circuit.

The ground fault test only functions when the motor is stationary.

Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.

4 Faults and alarms

4.2 List of faults and alarms

Remedy

- check the motor-side converter connection for a phase-phase short-circuit.
- rule-out interchanged line and motor cables.
- check for a ground fault.
- check the motor cable connections

For a ground fault the following applies:

- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).
- increase the de-energization time (p0347).
- increase pulse cancellation delay time (p1228) to ensure standstill.
- if required, deactivate the monitoring (p1901).

| Reaction: | OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2) |
| Acknowledge: | IMMEDIATELY |
| Cause | <p>For a vector drive the system has identified that the motor has stall for a time longer than is set in p2178.</p> <p>Fault value (r0949, interpret decimal):</p> <ol style="list-style-type: none"> 1: Stall detection using r1408.11 (p1744, p0492) vector control with encoder. 2: Stall detection using r1408.12 (p1745) or (r0084 ... r0083). <p>See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)</p> |

Remedy Steps should always be taken to ensure that both motor data identification and the rotating measurement were (if possible) carried out (see p1900, r3925).
 For closed-loop speed and torque control with speed encoder, the following applies:
 - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
 - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.
 If there is no fault, then the fault tolerance (p1744 and p0492) can be increased.
 For closed-loop speed and torque control without speed encoder, the following applies:
 - Check whether the drive is in the open-loop speed control operating range (see p1755), or if the speed setpoint is still zero, whether the load alone caused the drive to stall. If yes, increase ramp-up time p1120, increase ramp-down time p1121 and increase current setpoint via p1610, p1611.
 - If the excitation time (p0346) of the induction motor was significantly reduced and the drive stalls when it is switched on and immediately run, then p0346 should be increased again.
 If there is no fault, then the fault tolerance can be increased (p1745).
 - check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.
 - if the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.
 The following generally apply for closed-loop and torque control:
 - check whether a line phase failure is affecting power unit PM250D.
 - check whether the motor cables are disconnected (see A07929).
 If there is no fault, then the delay time can be increased (p2178).

A07903 Drive: Motor speed deviation
Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause The absolute value of the speed difference from the setpoint (p2151) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166).
 The alarm is only enabled for p2149.0 = 1.
 Possible causes:
 - the load torque is greater than the torque setpoint.
 - when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small.
 - for closed-loop torque control, the speed setpoint does not track the speed actual value.
 - for active Vdc controller.
 For U/f control, the overload condition is detected as the I_max controller is active.
 See also: p2149 (Monitoring configuration)
Remedy
 - increase p2163 and/or p2166.
 - increase the torque/current/power limits.
 - for closed-loop torque control: The speed setpoint should track the speed actual value.
 - deactivate alarm with p2149.0 = 0.

A07910 (N) Drive: Motor overtemperature
Message class: Motor overload (8)
Reaction: NONE
Acknowledge: NONE
Cause KTY84/PT1000 or no sensor:
 The measured motor temperature or the temperature of the motor temperature model 2 has exceeded the alarm threshold (p0604). The response parameterized in p0610 becomes active.
 PTC or bimetallic NC contact:
 The response threshold of 1650 Ohm was exceeded or the NC contact opened.
 Alarm value (r2124, interpret decimal):
 11: No output current reduction.
 12: Output current reduction active.
 See also: p0604 (Mot_temp_mod 2/sensor alarm threshold), p0610 (Motor overtemperature response)

Remedy

- check the motor load.
- check the motor ambient temperature.
- check KTY84/PT1000.
- check overtemperatures of the motor temperature model 2 (p0626 ... p0628).

| A07960 | Drive: Incorrect friction characteristic |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The friction characteristic is incorrect. Alarm value (r2124, interpret decimal): 1538: The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 1539: The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 3820 ... 3829: Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition: $0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$ or $p1082$, if $p0322 = 0$ Therefore the output of the friction characteristic (r3841) is set to zero. 3830 ... 3839: Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition: $0 \leq p3830, p3831 \dots p3839 \leq p0333$ Therefore the output of the friction characteristic (r3841) is set to zero. 4 Faults and alarms

4.2 List of faults and alarms

Remedy

Fulfill the conditions for the friction characteristic.
For alarm value = 1538:
Check the upper effective torque limit (e.g. in the field weakening range).
For alarm value = 1539:
Check the lower effective torque limit (e.g. in the field weakening range).
For alarm value = 3820 ... 3839:
Fulfill the conditions to set the parameters of the friction characteristic.
If the motor data (e.g. the maximum speed p0322) are changed during commissioning (p0010 = 1, 3), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting p0340= 5.

A07961 **Drive: Friction characteristic record activated**

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE

3820 ... 3829: speed (p382x) cannot be approached.
3840: Friction characteristic incorrect.
3845: Friction characteristic record de-selected.

Remedy

Fulfill the conditions to record the friction characteristic.

For fault value = 0046:

- establish missing enable signals.

For fault value = 1082, 1084, 1087:

- Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1110:

- Select the friction characteristic record, positive direction (p3845).

For fault value = 1111:

- Select the friction characteristic record, negative direction (p3845).

For fault value = 1198:

- Enable the permitted direction (p1110, p1111, r1198).

For fault value = 1300:

- set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21).

For fault value = 1755:

- For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1910:

- Exit the motor data identification routine (p1910).

For fault value = 1960:

- Exit the speed controller optimization routine (p1960).

For fault value 3820 ... 3829:

- check the load at speed p382x.
- check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable.

For fault value = 3840:

- Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840).

For fault value = 3845:

- Activate the friction characteristic record (p3845).

F07967 **Drive: Incorrect pole position identification**

| F07969 | Drive: Incorrect pole position identification |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | A fault has occurred during the pole position identification routine. Fault value (r0949, interpret decimal): 1: Current controller limited 2: Motor shaft locked. 10: Stage 1: The ratio between the measured current and zero current is too low. 11: Stage 2: The ratio between the measured current and zero current is too low. 12: Stage 1: The maximum current was exceeded. 13: Stage 2: The maximum current was exceeded. 14: Current difference to determine the +d axis too low. 15: Second harmonic too low. 16: Drive converter too small for the measuring technique. 17: Abort due to pulse inhibit. 18: First harmonic too low. 20: Pole position identification requested with the motor shaft rotating and activated "flying restart" function. |

Remedy

For fault value = 1:
Check whether the motor is correctly connected.
Check whether motor data have been correctly entered.
Replace the power unit involved.

For fault value = 2:
Bring the motor into a no-load condition.

For fault value = 10:
When selecting p1980 = 4: Increase the value for p0325.
When selecting p1980 = 1: Increase the value for p0329.
Check whether the motor is correctly connected.
Replace the power unit involved.

For fault value = 11:
Increase the value for p0329.
Check whether the motor is correctly connected.
Replace the power unit involved.

For fault value = 12:
When selecting p1980 = 4: Reduce the value for p0325.
When selecting p1980 = 1: Reduce the value for p0329.
Check whether motor data have been correctly entered.

For fault value = 13:
Reduce the value for p0329.
Check whether motor data have been correctly entered.

For fault value = 14:
Increase the value for p0329.

For fault value = 15:
Increase the value for p0325.
Motor not sufficiently anisotropic, change the technique (p1980 = 1, 10).

For fault value = 16:
Change the technique (p1980).

For fault value = 17:
Repeat technique.

For fault value = 18:
Increase the value for p0329 (if required, first set p0323).
Saturation not sufficient, change the technique (p1980 = 10).

For fault value = 20:
Before carrying out a pole position identification routine ensure that the motor shaft is absolutely stationary (zero speed).

Remedy

For fault value = 1 ... 40:

- check whether motor data have been correctly entered in p0300, p0304 ... p0311.
- is there an appropriate relationship between the motor power rating and that of the power unit? The ratio of the power unit to the rated motor current should not be less than 0.5 and not be greater than 4.
- check connection type (star-delta).

For fault value = 4, 7:

- check whether the inductance in p0233 is correctly set.
- check whether motor has been correctly connected (star-delta).

For fault value = 11 in addition:

- deactivate oscillation monitoring (p1909.7 = 1).

For fault value = 12:

- check the power cable connections.
- check the motor.
- check the CT.

A07991 (N) Drive: Motor data identification activated

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause

The motor data identification routine is activated.

The motor data identification routine is carried out at the next switch-on command.

If rotating measurement is selected (see p1900, p1960), it will not be possible to save the parameter assignment. Once motor data identification has been completed or deactivated, the option to save the parameter assignment will be made available again.

Remedy

Not necessary.

The alarm automatically disappears after the motor data identification routine has been successfully completed or for the setting p1900 = 0.

A07994 (F, N) Drive: motor data identification not performed

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause

The "vector control" mode has been selected and a motor data identification has still not been performed.

The alarm is initiated when changing the drive data set (see r0051) in the following cases:

- vector control is parameterized in the actual drive data set (p1300 >= 20).

and

- motor data identification has still not been performed in the actual drive data set (see r3925).

Note:

A check can be made and the alarm output also when exiting commissioning and when the system runs up.

Remedy

- Perform motor data identification (see p1900).
- if required, parameterize "U/f control" (p1300 < 20) or set p0096 = 0 (only G120).
- switch over to a drive data set, in which the conditions do not apply.

- Remedy**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star/delta).
 - U/f operation: Increase up ramp.
 - U/f operation: Check assignment of rated currents of motor and power unit.
 - check the line supply quality.
 - reduce motor load.

 - replace power unit.
 - check the line supply phases.

F30002 Power unit: DC link voltage overvoltage

Message class: DC link overvoltage (4)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause The power unit has detected an overvoltage condition in the DC link.

- motor regenerates too much energy.
- line supply voltage too high.
- line phase interrupted.
- DC link voltage control switched off.
- dynamic response of DC link voltage controller excessive or insufficient.

Fault value (r0949, interpret decimal):

DC link voltage at the time of trip [0.1 V].

Remedy

- increase the ramp-down time (p1121).
 - set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
 - Activate the DC link voltage controller (p1240, p1280).
 - adapt the dynamic response of the DC link voltage controller (p1243, p1247, p1283, p1287).
 - check the line supply and DC link voltage. set p0210 as low as possible (also see A07401, p1294 = 0).
 - check and correct the phase assignment at the power unit.
 - check the line supply phases.
- See also: p0210 (Drive unit line supply voltage)

F30003 Power unit: DC link voltage undervoltage

Message class: Infeed faulted (13)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line phase interrupted.

Note:

The monitoring threshold for the DC link undervoltage is the minimum of the following values:

- for a calculation, refer to p0210.

Remedy

- check the line supply voltage
 - check the line supply phases.

| F30021 | Power unit: Ground fault |
| Message class: | Ground fault / inter-phase short-circuit detected (7) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |

Cause The power has detected a ground fault.
Possible causes:
- ground fault in the power cables.
- ground fault at the motor.
- CT defective.
- when the brake closes, this causes the hardware DC current monitoring to respond.
- short-circuit at the braking resistor.
Fault value (r0949, interpret decimal):
0:
- the hardware DC current monitoring has responded.
- short-circuit at the braking resistor.
> 0:
Absolute value, summation current [32767 = 271 % rated current].

Remedy
- check the power cable connections.
- check the motor.
- check the CT.
- check the cables and contacts of the brake connection (a wire is possibly broken).
- check the braking resistor.

F30022 **Power unit: Monitoring U_{ce}**
Message class: Ground fault / inter-phase short-circuit detected (7)
Reaction: OFF2
Acknowledge: POWER ON
Cause In the power unit, the monitoring of the collector-emitter voltage (U_{ce}) of the semiconductor has responded.
Possible causes:
- fiber-optic cable interrupted.
- power supply of the IGBT gating module missing.
- short-circuit at the power unit output.
- defective semiconductor in the power unit.
Fault value (r0949, interpret binary):
Bit 0: Short-circuit in phase U
Bit 1: Short circuit in phase V
Bit 2: Short-circuit in phase W
Bit 3: Light transmitter enable defective
Bit 4: U_{ce} group fault signal interrupted

F30025

Power unit: Chip overtemperature

Message class: Power electronics faulted (5)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause The chip temperature of the semiconductor has exceeded the permissible limit value.

- the permissible load duty cycle was not maintained.
- Insufficient cooling, fan failure.
- Overload.
- Ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):

Temperature difference between the heat sink and chip [0.01 °C].

Remedy

- adapt the load duty cycle.
- Check whether the fan is running.
- Check the fan elements.
- Check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

Power unit: Precharging DC link time monitoring

Message class: Infeed faulted (13)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause

The power unit DC link was not able to be precharged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The DC link has either a ground fault or a short-circuit.
- 8) Precharging circuit may be defective.

| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | When the brake is being opened, it is detected that the power supply voltage is less than 21.4 V Alarm value (r2124, interpret decimal): Supply voltage fault [0.1 V]. Example: Alarm value = 195 --> voltage = 19.5 V |
| Remedy | Check the 24 V voltage for stability and value. |

| | |
|-----------------------|---|
| A30057 | Power unit: Line asymmetry |
| Message class: | Network fault (2) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting. |
| Remedy | - check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011. |

| A30065 (F, N) | Voltage measured values not plausible |
| Message class: | Power electronics faulted (5) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The voltage measurement is not supplying any plausible values Alarm value (r2124, interpret bitwise binary): Bit 1: Phase U. Bit 2: Phase V. Bit 3: Phase W. |
| Remedy | - Deactivate voltage measurement (p0247.0 = 0). - Deactivate flying restart with voltage measurement (p0247.5 = 0) and deactivate fast flying restart (p1780.11 = 0). |

| F30068 | Power unit: undertemperature inverter heat sink |
| Message class: | Power electronics faulted (5) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | The actual inverter heat sink temperature is below the permissible minimum value. Possible causes: - the power unit is being operated at an ambient temperature that lies below the permissible range. - the temperature sensor evaluation is defective. Fault value (r0949, interpret decimal): inverter heat sink temperature [0.1 °C]. |
| Remedy | - ensure that higher ambient temperatures prevail. - replace the power unit. |
| F30071 | No new actual values received from the Power Module |
| Message class: | Internal (DRIVE-CLiQ) communication error (12) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | More than one actual value telegram from the power unit module has failed. |
| Remedy | Check the interface (adjustment and locking) to the power unit module. |
| F30072 | Setpoints can no longer be transferred to the Power Module |
| Message class: | Internal (DRIVE-CLiQ) communication error (12) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | More than one setpoint telegram was not able to be transferred to the power unit module. |
| Remedy | Check the interface (adjustment and locking) to the power unit module. |
| F30074 (A) | Communication error between the Control Unit and Power Module |
| Message class: | Internal (DRIVE-CLiQ) communication error (12) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY |
| Cause | Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted. Fault value (r0949, interpret hexadecimal): 0 hex: - a Control Unit with external 24 V supply was withdrawn from the Power Module during operation. - with the Power Module switched off, the external 24 V supply for the Control Unit was interrupted for some time. 1 hex: The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible. 20A hex: The Control Unit was inserted on a Power Module, which has another code number. 20B hex: The Control Unit was inserted on a Power Module, which although it has the same code number, has a different serial number. The Control Unit executes an automatic warm restart to accept the new calibration data. |
| Remedy | For fault value = 0 and 20A hex: Insert the Control Unit on an appropriate Power Module and continue operation. If required, carry out a POWER ON of the Control Unit. For fault value = 1 hex: Carry out a POWER ON of the Control Unit. |
| F30075 | Configuration of the power unit unsuccessful |

4 Faults and alarms

4.2 List of faults and alarms

| | |
|---------------|--|
| Cause | A communication error has occurred while configuring the power unit using the Control Unit. The cause is not clear. Fault value (r0949, interpret decimal): 0: The output filter initialization was unsuccessful. 1: Activation/deactivation of the regenerative feedback functionality was unsuccessful. |
| Remedy | - acknowledge the fault and continue operation. - if the fault reoccurs, carry out a POWER ON (switch-off/switch-on). - if required, replace the power unit. |

| | |
|-----------------------|---|
| F30080 | Power unit: Current increasing too quickly |
| Message class: | Power electronics faulted (5) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | The power unit has detected an excessive rate of rise in the overvoltage range. - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: rated current of motor much greater than that of power unit. - power cables are not correctly connected. - power cables exceed the maximum permissible length. - power unit defective. Fault value (r0949, interpret bitwise binary): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W. |
| Remedy | - check the motor data - if required, carry out commissioning. - check the motor circuit configuration (star-delta) - U/f operation: Increase up ramp. - U/f operation: Check assignment of rated currents of motor and power unit. - check the power cable connections. - check the power cables for short-circuit or ground fault. - check the length of the power cables. - replace power unit. |

| | |
|-----------------------|---|
| F30081 | Power unit: Switching operations too frequent |
| Message class: | Power electronics faulted (5) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | The power unit has executed too many switching operations for current limitation. - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: rated current of motor much greater than that of power unit. - power cables are not correctly connected. - power cables exceed the maximum permissible length. - power unit defective. Fault value (r0949, interpret bitwise binary): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W. |

- Remedy**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star-delta)
 - U/f operation: Increase up ramp.
 - U/f operation: Check assignment of rated currents of motor and power unit.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.

F30105 **PU: Actual value sensing fault**

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause At least one incorrect actual value channel was detected on the Power Stack Adapter (PSA).
The incorrect actual value channels are displayed in the following diagnostic parameters.

Remedy Evaluate the diagnostic parameters.
If the actual value channel is incorrect, check the components and if required, replace.

A30502 **Power unit: DC link overvoltage**

Message class: DC link overvoltage (4)
Reaction: NONE
Acknowledge: NONE
Cause The power unit has detected overvoltage in the DC link on a pulse inhibit.
- device connection voltage too high.
- line reactor incorrectly dimensioned.
Alarm value (r0949, interpret decimal):
DC link voltage [1 bit = 100 mV].
See also: r0070 (Actual DC link voltage)

Remedy - check the device supply voltage (p0210).
- check the dimensioning of the line reactor.
See also: p0210 (Drive unit line supply voltage)

F30600 **SI P2: STOP A initiated**

Message class: Safety monitoring channel has identified an error (10)
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause The drive-integrated "Safety Integrated" function on processor 2 has detected an error and initiated a STOP A.
- forced checking procedure (test stop) of the safety switch-off signal path on processor 2 unsuccessful.
- subsequent response to fault F30611 (defect in a monitoring channel).
Fault value (r0949, interpret decimal):
0: Stop request from processor 1.
1005: Pulses suppressed although STO not selected and there is no internal STOP A present.
1010: Pulses enabled although STO is selected or an internal STOP A is present.
1011: Internal fault for the pulse enable in the Power Module.
9999: Subsequent response to fault F30611.

Remedy - select Safe Torque Off and de-select again.
- Carry out a POWER ON (switch-off/switch-on) for all components.
- replace Power Module involved.
For fault value = 9999:
- carry out diagnostics for fault F30611.
Note:
PM: Power Module
STO: Safe Torque Off

4 Faults and alarms

4.2 List of faults and alarms

Remedy

For fault value = 10, 15, 16, 18:

- check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Control Unit that supports the required function.

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

Note:

F-DI: Failsafe Digital Input
STO: Safe Torque Off

F30662 **Error in internal communications**

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: POWER ON

Cause

A module-internal communication error has occurred.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

Remedy

- Carry out a POWER ON (switch-off/switch-on).
- Upgrade firmware to later version.
- Contact Technical Support.

F30664 **Error while booting**

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: POWER ON

Cause

An error has occurred during booting.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

Remedy

- Carry out a POWER ON (switch-off/switch-on).
- Upgrade firmware to later version.
- Contact Technical Support.

F30665 **SI P2: System is defective**

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause

A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).

Fault value (r0949, interpret hexadecimal):

200000 hex, 400000 hex:

- fault in the actual booting/operation.

Additional values:

- defect before the last time that the system booted.

Remedy

- Carry out a POWER ON (switch-off/switch-on).
- Upgrade firmware to later version.
- Contact Technical Support.

For fault value = 400000 hex:

- ensure that the Control Unit is connected to the Power Module.

A30666 (F) **SI Motion P2: Steady-state (static) 1 signal at the F-DI for safe acknowledgment**

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

| | |
|---------------|---|
| Cause | A logical 1 signal is present at the F-DI configured in p10106 for more than 10 seconds. If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces. |
| Remedy | Set the Failsafe Digital Input (F-DI) to a logical 0 signal (p10106). Note: F-DI: Failsafe Digital Input |

| F30680 | SI Motion P2: Checksum error safety monitoring functions |
| Message class: | Safety monitoring channel has identified an error (10) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY (POWER ON) |
| Cause | The actual checksum calculated by processor 2 and entered in r9398 over the safety-relevant parameters does not match the reference checksum saved in p9399 at the last machine acceptance. Safety-relevant parameters have been changed or a fault is present. Note: This fault results in a STOP A that can be acknowledged. Fault value (r0949, interpret decimal): 0: Checksum error for SI parameters for motion monitoring. 1: Checksum error for SI parameters for component assignment. |
| Remedy | - check the safety-relevant parameters and if required, correct. - set the reference checksum to the actual checksum. - execute the function "Copy RAM to ROM". - perform a POWER ON if safety parameters requiring a POWER ON have been modified. - carry out an acceptance test. |

| | |

| A30693 (F) | SI P2: Safety parameter settings changed, POWER ON required |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |

Cause Safety parameters have been changed; these will only take effect following a POWER ON.
Notice:
All changed parameters of the safety motion monitoring functions will only take effect following a POWER ON.
Alarm value (r2124, interpret decimal):
Parameter number of the safety parameter which has changed, necessitating a POWER ON.

Remedy

- Execute the function "Copy RAM to ROM".
- Carry out a POWER ON (switch-off/switch-on).

F30700**SI Motion P2: STOP A initiated**

Message class: Safety monitoring channel has identified an error (10)
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause The drive is stopped via a STOP A (pulse cancellation via the safety switch-off signal path of processor 1).
Possible causes:

- Stop request from processor 1.
- Pulses not suppressed after test stop selection.
- Subsequent response to the message C30706 "SI Motion P2: SAM/SBR limit exceeded".
- Subsequent response to the message C30714 "SI Motion P2: Safely-Limited Speed exceeded".
- Subsequent response to the message C30701 "SI Motion P2: STOP B initiated".

Remedy

- Remove the cause of the fault on the monitoring channel of processor 1.
- Check the switch-off signal path of processor 2.
- Carry out a diagnostics routine for message C30706.
- Carry out a diagnostics routine for message C30714.
- Carry out a diagnostics routine for message C30701.
- Replace Power Module.
- Replace Control Unit.

F30701**SI Motion P2: STOP B initiated**

Message class: Safety monitoring channel has identified an error (10)
Reaction: NONE (OFF3)
Acknowledge: IMMEDIATELY (POWER ON)
Cause The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp).
As a result of this fault, after the speed threshold parameterized in p9360 is fallen below, message C30700 "STOP A initiated" is output.
Possible causes:

- Stop request from processor 1.
- Subsequent response to the message C30714 "SI Motion P2: Safely-Limited Speed exceeded".
- Subsequent response to the message C30711 "SI Motion P2: Defect in a monitoring channel".
- Subsequent response to the message C30707 "SI Motion P2: tolerance for Safe Operating Stop exceeded".

Remedy

- Remove the cause of the fault on the monitoring channel of processor 1.
- Carry out a diagnostics routine for message C30714.
- Carry out a diagnostics routine for message C30711.
- Carry out a diagnostics routine for message C30707.

| Cause | When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. If at least one monitoring function is active, then message C30701 "SI Motion: STOP B initiated" is output. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply: - synchronization error between processor 1 and processor 2. Message value (r2124, interpret decimal): 0 ... 999: Number of the cross-compared data that resulted in this message. The significance of the individual message values is described in safety message C01711. 1000: Watchdog timer has expired. | Cause | The Failsafe Digital Inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret binary): Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs. |
| Remedy | - Check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe. Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9307.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked: - $p10102 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10102 \geq 12 \text{ ms}$ (discrepancy time must be no less than 12 ms) - $p10102 > td$ (discrepancy time must be greater than the switch discrepancy time that may actually occur) td = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms. tp = period for a switching operation in ms. When debounce p10117 is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p10102 < p10117 + 1 \text{ ms} - td$ - $p10102 > td$ - $p10102 \geq 12 \text{ ms}$ Example: For a 110 ms switching frequency and $p10117 = 0$, the maximum discrepancy time that can be set is as follows: $p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$ Rounded off, $p10102 \leq 36 \text{ ms}$ is obtained (as the discrepancy time is rounded off as a multiple of 12 ms). | Message class: | Safety monitoring channel has identified an error (10) |
| Reaction: | NONE |
| Acknowledge: | IMMEDIATELY (POWER ON) |

Cause

A fault has occurred on processor 2 during the forced checking procedure (test stop) of the Failsafe Digital Output.

Fault value (r0949, interpret hexadecimal):

RRRVWXYZ hex:

R: Reserved.

V: Actual state of the DO channel concerned (see X) on processor 2 (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).

W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).

X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).

Y: Reason for the test stop fault.

Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault

Y = 1: Processor 1 in incorrect test stop state (internal fault).

Y = 2: Expected states of the DOs were not fulfilled (CU240D-2: readback via DI 5 / CU250S-2 readback via DI 6).

Y = 3: Incorrect timer state on processor 1 (internal fault)

Y = 4: Expected states of the diag DOs were not fulfilled (CU240D-2: internal readback on processor 1 channel / CU250S-2 readback via DI6).

Y = 5: Expected states of the second diag DOs were not fulfilled (CU240D-2: internal readback on processor 2).

X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).

In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions

Z = 0 ... 3: Synchronization phase of test stop between processor 1 and processor 2 no switching operations

Z = 4: DO + OFF and DO - OFF

Z = 5: Check to see if states are as expected

Z = 6: DO + ON and DO - ON

Z = 7: Check to see if states are as expected

Z = 8: DO + OFF and DO - ON

Z = 9: Check to see if states are as expected

Z = 10: DO + ON and DO - OFF

Z = 11: Check to see if states are as expected

Z = 12: DO + OFF and DO - OFF

Z = 13: Check to see if states are as expected

Z = 14: End of test stop

4 Faults and alarms

4.2 List of faults and alarms

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy

Check the wiring of the Failsafe Digital Output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.
- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

Cause

The automatic test stop was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via Safety Extended Functions.
- a safety message is present, that resulted in a STO.

Remedy

- Deselect STO via Safety Extended Functions.

- remove the cause of the safety messages and acknowledge the messages.

The automatic test stop is performed after removing the cause.

F31100 (N, A) Encoder 1: Zero mark distance error

Message class: Actual position/speed value incorrect or not available (11)

Reaction: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause

The measured zero mark distance does not correspond to the parameterized zero mark distance.

For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.

The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
Fault value (r0949, interpret decimal):
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).
The sign designates the direction of motion when detecting the zero mark distance.
See also: p0491 (Motor encoder fault response ENCODER)

- Remedy**
- Check that the encoder cables are routed in compliance with EMC.
 - Check the plug connections.
 - check the encoder type (encoder with equidistant zero marks).
 - adapt the parameter for the distance between zero marks (p0424, p0425).
 - if message output above speed threshold, reduce filter time if necessary (p0438).
 - replace the encoder or encoder cable.

F31101 (N, A) Encoder 1: Zero mark failed

Message class: Actual position/speed value incorrect or not available (11)

Reaction: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause

The 1.5 x parameterized zero mark distance was exceeded.

The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
Fault value (r0949, interpret decimal):
Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).
See also: p0491 (Motor encoder fault response ENCODER)

- Remedy**
- Check that the encoder cables are routed in compliance with EMC.
 - Check the plug connections.
 - check the encoder type (encoder with equidistant zero marks).
 - adapt the parameter for the clearance between zero marks (p0425).
 - if message output above speed threshold, reduce filter time if necessary (p0438).
 - when p0437.1 is active, check p4686.
 - replace the encoder or encoder cable.

A31431 (F, N) Encoder 1: Deviation position incremental/absolute too large

Message class: Actual position/speed value incorrect or not available (11)

Reaction: NONE

Acknowledge: NONE

Cause When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Alarm value (r2124, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

- Remedy**
- Check that the encoder cables are routed in compliance with EMC.
 - Check the plug connections.
 - replace the encoder or encoder cable.
 - Clean coding disk or remove strong magnetic fields.

F31802 (N, A) Encoder 1: Time slice overflow

Message class: Hardware/software error (1)

Reaction: ENCODER (IASC/DCBRK, NONE)

Acknowledge: IMMEDIATELY

Cause A time slice overflow has occurred in encoder 1.

Fault value (r0949, interpret hexadecimal):

yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved

x = 9:

Time slice overflow of the fast (current controller clock cycle) time slice.

x = A:

Time slice overflow of the average time slice.

x = C:

Time slice overflow of the slow time slice.

yx = 3E7:

Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).

A31930 (N) Encoder 1: Data logger has saved data
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.
The diagnostics data is saved in the following folder:
/USER/SINAMICS/DATA/SMTRC00.BIN
...
/USER/SINAMICS/DATA/SMTRC07.BIN
/USER/SINAMICS/DATA/SMTRCIDX.TXT
The following information is contained in the TXT file:
- Display of the last written BIN file.
- Number of write operations that are still possible (from 10000 downwards).
Note:
Only Siemens can evaluate the BIN files.
Remedy Not necessary.
The alarm disappears automatically.
The data logger is ready to record the next fault case.

| Acknowledge: | IMMEDIATELY |
| Cause | A time slice overflow has occurred in encoder 2. Fault value (r0949, interpret hexadecimal): yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved x = 9: Time slice overflow of the fast (current controller clock cycle) time slice. x = A: Time slice overflow of the average time slice. x = C: Time slice overflow of the slow time slice. yx = 3E7: Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation). |

Remedy Increase the current controller sampling time
 Note:
 For a current controller sampling time = 31.25 µs, use an SMx20 with order number 6SL3055-0AA00-5xA3.

F32805 (N, A) Encoder 2: EEPROM checksum error

Message class: Hardware/software error (1)
Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause Internal parameter data is corrupted.
 Fault value (r0949, interpret hexadecimal):
 01: EEPROM access error.
 02: Too many blocks in the EEPROM.
Remedy Replace the module.

F32850 (N, A) Encoder 2: Encoder evaluation internal software error

Message class: Hardware/software error (1)
Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Acknowledge: POWER ON
Cause An internal software error has occurred in the Sensor Module of encoder 2.
 Fault value (r0949, interpret decimal):
 1: Background time slice is blocked.
 2: Checksum over the code memory is not OK.
 10000: OEM memory of the EnDat encoder contains data that cannot be interpreted.
 11000 ... 11499: Descriptive data from EEPROM incorrect.
 11500 ... 11899: Calibration data from EEPROM incorrect.
 11900 ... 11999: Configuration data from EEPROM incorrect.
 12000 ... 12008: communication with analog/digital converter faulted.
 16000: DRIVE-CLiQ encoder initialization application error.
 16001: DRIVE-CLiQ encoder initialization ALU error.
 16002: DRIVE-CLiQ encoder HISI / SISI initialization error.
 16003: DRIVE-CLiQ encoder safety initialization error.
 16004: DRIVE-CLiQ encoder internal system error.
Remedy - replace the Sensor Module.
 - if required, upgrade the firmware in the Sensor Module.
 - Contact Technical Support.

F32899 (N, A) Encoder 2: Unknown fault

Message class: Actual position/speed value incorrect or not available (11)
Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
Acknowledge: IMMEDIATELY (POWER ON)
Cause A fault occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware.
 This can occur if the firmware on this component is more recent than the firmware on the Control Unit.
 Fault value (r0949, interpret decimal):
 Fault number.
 Note:
 If required, the significance of this new fault can be read about in a more recent description of the Control Unit.
Remedy - replace the firmware on the Sensor Module by an older firmware version (r0148).
 - upgrade the firmware on the Control Unit (r0018).

F32905 (N, A) Encoder 2: Parameterization error

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
Acknowledge: IMMEDIATELY

| | |
|---------------|---|
| Cause | <p>A parameter of encoder 2 was detected as being incorrect. It is possible that the parameterized encoder type does not match the connected encoder. The parameter involved can be determined as follows: - determine the parameter number using the fault value (r0949). - determine the parameter index (p0187). Fault value (r0949, interpret decimal): yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter xxxx = 421: For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits. yyyy = 0: No additional information available. yyyy = 1: The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1). yyyy = 2: A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification. yyyy = 3: A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000. yyyy = 4: This component does not support SSI encoders (p0404.9 = 1) without track A/B. yyyy = 5: For SQW encoder, value in p4686 greater than in p0425. yyyy = 6: DRIVE-CLiQ encoder cannot be used with this firmware version. yyyy = 7: For an SQW encoder, the Xact1 correction (p0437.2) is only permitted with equidistant zero marks. yyyy = 8: The motor pole pair width is not supported by the linear scale being used. yyyy = 9: The length of the position in the EnDat protocol may be a maximum of 32 bits. yyyy = 10: The connected encoder is not supported. yyyy = 11: The hardware does not support track monitoring.</p> |
| Remedy | <ul style="list-style-type: none"> - check whether the connected encoder type matches the encoder that has been parameterized. - correct the parameter specified by the fault value (r0949) and p0187. - re parameter number = 314: - check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 * p0433) / p0432 <= 1000). |

| A32915 (F, N) | Encoder 2: Configuration error |
| Message class: | Error in the parameterization / configuration / commissioning procedure (18) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | <p>The configuration for encoder 2 is incorrect. Alarm value (r2124, interpret decimal): 1: Re-parameterization between fault/alarm is not permissible. 419: When the fine resolution Gx_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.</p> |

Remedy For alarm value = 1:
No re-parameterization between fault/alarm.
For alarm value = 419:
Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

A32930 (N) Encoder 2: Data logger has saved data

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE

Cause For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.
The diagnostics data is saved in the following folder:
/USER/SINAMICS/DATA/SMTRC00.BIN
...
/USER/SINAMICS/DATA/SMTRC07.BIN
/USER/SINAMICS/DATA/SMTRCIDX.TXT
The following information is contained in the TXT file:
- Display of the last written BIN file.
- Number of write operations that are still possible (from 10000 downwards).
Note:
Only Siemens can evaluate the BIN files.

Remedy Not necessary.
The alarm disappears automatically.
The data logger is ready to record the next fault case.

F32950 Encoder 2: Internal software error

Message class: Hardware/software error (1)
Reaction: OFF1 (OFF2)
Acknowledge: POWER ON

Cause An internal software error has occurred.
Fault value (r0949, interpret decimal):
Information about the fault source.
Only for internal Siemens troubleshooting.

Remedy - if necessary, upgrade the firmware in the Sensor Module to a later version.
- Contact Technical Support.

A32999 (F, N) Encoder 2: Unknown alarm

Message class: Actual position/speed value incorrect or not available (11)
Reaction: NONE
Acknowledge: NONE

Cause A alarm has occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit.
Alarm value (r2124, interpret decimal):
Alarm number.
Note:
If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.

Remedy - replace the firmware on the Sensor Module by an older firmware version (r0148).
- upgrade the firmware on the Control Unit (r0018).

A50001 (F) PROFINET configuration error

Message class: Communication error to the higher-level control system (9)
Reaction: NONE
Acknowledge: NONE

4 Faults and alarms

4.2 List of faults and alarms

| | |
|---------------|--|
| Cause | A PROFINET controller attempts to establish a connection using an incorrect configuring telegram. The "Shared Device" function has been activated (p8929 = 2). Alarm value (r2124, interpret decimal): 10: A/F-CPU configures mixed PZD/PROFIsafe telegram. 13: F-CPU and PROFIsafe is not activated (p9601.3). 15: PROFIsafe telegram of the F-CPU does not match the setting in p9501.30. See also: p9601 (SI enable functions integrated in the drive (processor 1)) |
| Remedy | Check the configuration of the PROFINET controllers as well as the p8929 setting. |

| | |
|-----------------------|---|
| A50010 (F) | PROFINET: Consistency error affecting adjustable parameters |
| Message class: | Communication error to the higher-level control system (9) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | A consistency error was detected when activating the configuration (p8925) for the PROFINET interface. The currently set configuration has not been activated. Alarm value (r2124, interpret decimal): 0: general consistency error 1: error in the IP configuration (IP address, subnet mask or standard gateway). 2: Error in the station names. 3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists. 4: a cyclic PROFINET connection is not possible as DHCP is activated. Note: DHCP: Dynamic Host Configuration Protocol See also: p8920 (PN Name of Station), p8921 (PN IP address), p8922 (PN Default Gateway), p8923 (PN Subnet Mask), p8924 (PN DHCP Mode) |
| Remedy | - check the required interface configuration (p8920 and following), correct if necessary, and activate (p8925). or - reconfigure the station via the "Edit Ethernet node" screen form (e.g. with STARTER commissioning software). See also: p8925 (Activate PN interface configuration) |

| | |
|-----------------------|--|
| A50011 (F) | Ethernet/IP: configuration error |
| Message class: | Communication error to the higher-level control system (9) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | An EtherNet/IP controller attempts to establish a connection using an incorrect configuring telegram. The telegram length set in the controller does not match the parameterization in the drive device. |
| Remedy | Check the set telegram length. For p0922 not equal to 999, then the length of the selected telegram applies. For p0922 = 999, the maximum interconnected PZD (r2067) applies. See also: p0922 (PROFIdrive PZD telegram selection), r2067 (PZD maximum interconnected) |

| | |
|-----------------------|---|
| A50020 (F) | PROFINET: Second controller missing |
| Message class: | Communication error to the higher-level control system (9) |
| Reaction: | NONE |
| Acknowledge: | NONE |
| Cause | The PROFINET function "Shared Device" has been activated (p8929 = 2). However, only the connection to a PROFINET controller is present. |
| Remedy | Check the configuration of the PROFINET controllers as well as the p8929 setting. |

| | |
|-----------------------|--|
| F50510 | FBLOCKS: Logon of the runtime group rejected |
| Message class: | General drive fault (19) |
| Reaction: | OFF2 |
| Acknowledge: | IMMEDIATELY |
| Cause | When the runtime groups of the free function blocks attempted to log on with the sampling time management, the logon of at least one runtime group was rejected. Too many different hardware sampling times may have been assigned to the free function blocks. |

Remedy - check number of available hardware sampling times ($T_{\text{sample}} < 8 \text{ ms}$) (r7903).

F50511 **FBLOCKS: Memory no longer available for free function blocks**
Message class: General drive fault (19)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause When the free function blocks were activated, more memory was requested than was available on the Control Unit.
Remedy Not necessary.

A50513 (F) **FBLOCKS: Run sequence value already assigned**
Message class: General drive fault (19)
Reaction: NONE
Acknowledge: NONE
Cause An attempt was made to assign a run sequence value already assigned to a function block on this drive object to another additional function block on the same drive object. A run sequence value can only be precisely assigned to one function block on one drive object.
Remedy Set another value that is still available on this drive object for the run sequence.

A50517 **FBLOCKS: Int. meas. active**
Message class: General drive fault (19)
Reaction: NONE
Acknowledge: NONE
Cause A Siemens internal measurement has been activated.
Remedy Carry out a POWER ON (switch-off/switch-on) for the Control Unit involved.

F50518 **FBLOCKS: Sampling time of free runtime group differs at download**
Message class: General drive fault (19)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause In the STARTER/SCOUT project that was downloaded, the hardware sampling time of a free runtime group ($1 \leq p20000[i] \leq 256$) was set to a value that was either too low or too high.
The sampling time must be between 1 ms and the value r20003 - r20002.
If the sampling time of the selected free runtime group is $< 1 \text{ ms}$, the equivalent value of 1 ms is used.
If the value $\geq r20003$, then the sampling time is set to the next higher or the same software sampling time $\geq r21003$.
Fault value (r0949, interpret decimal):
Number of the p20000 index of the runtime group where the sampling time is incorrectly set.
Number of the runtime group = fault value + 1
Remedy - Correctly set the sampling time of the runtime group.
- If required, take all of the blocks from the runtime group.
Note:
Fault F50518 only detects an incorrectly parameterized runtime group. If, after correcting p20000[i] in the project, this error occurs again at download, then the runtime group involved should be identified using the fault value (r0949) and the sampling time correctly set.
