Note:	For an extended general 2nd-order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{\text{3dB bandwidth}} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$

The following applies for vector drives (p0107): The pulse frequency can also be reduced when changing over the modulator to an optimized pulse pattern. This is used to avoid overcontrol. In the case of chassis power units, two-thirds of the setpoint pulse frequency is displayed in the FLB modulation range.

Dependency:	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), or if the power unit firmware is not able to calculate edge modulation (r0192.0 = 0), then only space vector modulation without overcontrol can be set as modulation type (p1802 = 3). For permanent-magnet synchronous motors and chassis power units, the following applies: Edge modulation or optimized pulse pattern can only be used, if p1810 bit 2 = 1 is set. Refer to: r0192, p0230, p7003		

- Notice:** If the pulse patterns are enabled with overmodulation option (p1802 < 3) or edge modulation (p1802 > 6), then the current actual value correction is automatically activated (p1840.0 = 0).
- Note:** When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.
- When changing p1802[x], the values for all of the other existing indices are also changed.
- p1802 = 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.
- The setting p1802 = 19 is only released for chassis power units and SIMOTICS FD motors.

Dependency: If bit 2 is set from 1 to 0, p1811 = 0 is set.

Notice: Bit 02 = 1 can only be set subject to the following prerequisites:

- Pulse inhibit
- r0192.16 = 1
- p1800 < 2 x 1000/p0115[0]

Bit 5, bit 14 and bit 15 can only be changed subject to the following prerequisites:

- Pulse inhibit

Note:

Re bit 02 = 0:

A gating unit that does not permit wobulation is used.

Re bit 02 = 1:

A gating unit that permits wobulation is used.

For pulse frequency wobulation with an amplitude equal to zero (p1811 = 0), the maximum possible pulse frequency in p1800 = 2 x 1/current controller clock cycle (p0115[0]).

For a wobulation amplitude greater than zero (p1811 > 0), the maximum possible pulse frequency in p1800 = 1/current controller clock cycle (p0115[0]).

Re bit 04 = 0 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is enabled.

Re bit 04 = 1 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is disabled.

Re bit 05 = 1:

Only permissible for r0192.19 = 1.

Re bit 10 = 0:

The pulse-locking function is activated.

Re bit 10 = 1:

The pulse-dropping function is activated.

Re bit 12 = 0 (only valid for bit 13 = 1):

The pulse frequency cannot be adjusted asynchronously to the current controller frequency (p1800)

Re bit 12 = 1 (only valid for bit 13 = 1):

The pulse frequency can be adjusted asynchronously to the current controller frequency (p1800)

Re bit 14 = 0 (only valid for bit 13 = 1):
Optimized pulse patterns are not used.
Re bit 14 = 1 (only valid for bit 13 = 1):
Optimized pulse patterns are used.
Re bit 15 = 0:
To de-activate flat-top control mode, p3400.1 also needs to be set to 0.
Re bit 15 = 1:
Flat-top control mode is active regardless of the setting for p3400.1.

Description:

Sets the configuration for the modulator.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
01	DC link voltage compensation in the power unit.	Yes	No	-
11	Current controller dynamics higher	Yes	No	-

Note:

Re bit 11:

Prerequisite:

- firmware version 4.4 or higher for the Control Unit and power unit.
- booksize or S120 Combi power unit (r0192.27 = 1).
- current controller sampling time p0115[0] >= 62.5 µs.
- for a Double Motor Module the two drive controls must be operated with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.
- it is not permissible that the "safety without encoder" is activated (p9306/p9506).

The following changes are necessary after changing bit 11:

- computing dead time (p0118 = 20.5 µs for bit 11 = 1, p0118 = 0 µs for bit 11 = 0).
- controller gains (p1715, p1460).
- with p0340 = 4 computing dead time and controller gains can be automatically pre-assigned. It may be necessary to still optimize the speed controller.

Before commissioning for the first time (p3925.0 = 0 for all data sets) this parameter is automatically preassigned to the optimum value.

13	Pulse freq. reduction before optimized pulse patterns for 500 µs	Yes	No	-
14	Deactivate maximum angular difference adaptation	Yes	No	-
15	Increase overmodulation range	Yes	No	-

Dependency:

If bit 2 is set from 1 to 0, p1811 = 0 is set.

Notice:

Bit 1 = 0 can only be set under a pulse inhibit and for r0192.14 = 1.

Bit 2 can only be set to 1 subject to the following prerequisites:

- Pulse inhibit
- r0192.16 = 1
- $p1800 < 2 \times 1000 / p0115[0]$

Bit 12 can only be changed subject to the following prerequisites:

- preconditions, the same as bit 2 = 1
- p1810.3 = 0

For fast current changes, bit 15 = 1 together with p1802 = 0, 2 and p1803 > 106 % result in a significant increase in the torque ripple. As a consequence, increasing the modulation limit must be checked on an application for application basis.

Note:

Re bit 00 = 0:

Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).

Re bit 00 = 1:

Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).

The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).

Re bit 01 = 0:

DC link voltage compensation in the modulator.

Re bit 01 = 1:

DC link voltage compensation in the current control.

Re bit 02 = 0:

A gating unit that does not permit wobulation is used.

Edge modulation is not possible for a parallel connection with a single-winding system (p7003 = 0).

Bit 02 cannot be set to 0 if bit 12 = 1.

Re bit 02 = 1:

A gating unit that permits wobulation is used.

For a wobulation amplitude p1811 = 0, the maximum possible pulse frequency in p1800 = $2 \times 1000 / p0115[0]$.

For a wobulation amplitude p1811 > 0, the maximum possible pulse frequency in p1800 = $1000 / p0115[0]$.

If optimized pulse patterns has been activated (p1802 > 6), then a parameter save is required and switch-off and switch-on again. This is displayed using a fault message (F01040).

Re bit 03 = 1:

The actual current value sensing and the determination of the valve ON times takes place with a double current controller clock cycle and phase offset.

The activation is only possible with r0192.23 = 1 and p1810.12 = 0 - and takes effect the next time the system is powered up.

Re bit 08 = 1:

Above the frequency threshold r1836[0], the pulse frequency is switched to the value in p1800. Below r1836[0] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see r0114).

Re bit 09 = 1:

Above the frequency threshold r1836[1], the pulse frequency is increased to the next possible value. Below r1836[1] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency.

If bit 8 is set to 0, bit 9 is automatically reset.

Re bit 10 = 0:

Pulse-locking function activated.

Re bit 10 = 1:

Pulse-dropping function activated.

Re bit 12 = 0:

The pulse frequency p1800 can also be synchronously set to the current controller clock cycle (see r0114).

Bit 12 can only be set from 1 to 0 if the pulse frequency p1800 is set synchronously to the current controller clock cycle. In this case, the gating unit is not switched over.

Re bit 12 = 1:

The pulse frequency p1800 can also be asynchronously set to the current controller clock cycle. In this case, the effects should be observed (see p1800).

If bit 12 is set to 1, then the gating unit is automatically switched over (p1810.2 = 1). If this is not possible (see above), then bit 12 cannot be set to 1.

Bit 12 cannot be set to 1, if p1810.3 = 1 is set.

Re bit 15 = 1

For p1802 = 0, 2 and p1803 > 106 %, dynamically, a modulation depth of more than 106 % is permitted. When p1803 is increased, the dynamic modulation depth reserve p1574 should be increased so that the maximum output voltage r0071 approximately remains the same.

Description:	Sets bit 0 for recording the power unit in the subgroup for the "offset clocking".		
Bit field:	Bit	Signal name	1 signal 0 signal FP
	00	Recording in subgroup for offset clocking	Yes No -
Dependency:	Refer to: p1818, p1819		

Note: A change only becomes effective after booting.
 If one of the following secondary conditions is not fulfilled, then none of the power units from the subgroup are clocked with an offset.
 Secondary conditions for clocking with an offset:
 - the PWM frequency (p1800[D]) of all power units in the subgroup must be the same.
 - the PWM frequency (p1800[D]) must be the same in all drive data sets in the subgroup.
 - the following must apply for the ratio between the PWM cycle (1/p1800[D]) and the current controller cycle (p0115[0]):
 The ratio (1/p1800[D]) / (p0115[0]) must be an even integer number (2, 4, 6, ...) for all power units in the subgroup.
 or
 The ratio (p0115[0]) / (1/p1800[D]) must be an integer number (1, 2, 3, ...) for all power units in the subgroup.

p1816	Set phase for PWM generation manually / Set Ph for PWM

Description: Sets manual setting and overwriting of automatically determined phase shift for "offset clocking".
 For p1816 = -1, the following applies:
 Automatic mode. The phase shift value is automatically determined.
 For p1816 = 0 ... 16, the following applies:
 Manual mode. The user should define the phase shift value as follows:
 1. PWM cycle (1/p1800) > current controller clock cycle (p0115[0])
 The power unit executes a phase shift from Tshift = current controller cycle (p0115[0]) * p1816.
 2. PWM cycle (1/p1800) <= current controller clock cycle (p0115[0])
 For p1816 >= 1, the power unit executes a phase shift from Tshift = PWM cycle/2.
Dependency: Refer to: r0116, p1800, p1819

p1817	Minimum ratio, pulse frequency to the output frequency / Min f_puls / f_max		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(2) Data type: FloatingPoint32 P-Group: Converter Not for motor type: - Min 8.3	Calculated: - Dyn. index: - Units group: - Scaling: - Max 15.0	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 12.0

Description: Sets the minimum ratio between the pulse frequency and the output frequency.
Notice: If the ratio between the pulse frequency and the output frequency is reduced, then oscillations can occur in the output current that can result in significant levels of current ripple with the appropriate negative effects.
Note: When the maximum speed is changed, the pulse frequency p1800 is automatically limited to this minimum ratio. It is not permissible to reduce the pulse frequency if this would result in this ratio being undershot.

	-1	16	0
Description:	Display for "offset clocking". Depending on the particular case, the value is interpreted differently: Case 1: The PWM clock cycle is greater than the current controller clock cycle (p0115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle and is an integer and even multiple of it (e.g. p0115[0] = 125 µs, pulse frequency = 4 kHz, 2 kHz). The value displayed refers to: - the phase shift in the current-controller cycles to be applied by the power unit. Case 2: The PWM clock cycle is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, pulse frequency = 8 kHz, 16 kHz). The value 1 displayed means that: - the power unit is to apply a phase shift of 180 ° (from the PWM cycle). A value of 0 displayed on all power units of the drive line-up means the following: - the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an offset.		
Dependency:	Refer to: p0108, r0108, p0115, p1800, p1815, p1816, p1818		
Note:	For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that the minimum value -1 no longer has any significance and is only available for reasons of compatibility.

	Min	Max	Factory setting
	0	1	0

Description: Setting to invert the output voltage.
This means that with the same setpoint, the axis direction is reversed without inverting the encoder actual value. When a speed encoder is being used, it may be necessary to also invert the encoder actual value (p0410).

Value:
0: OFF
1: ON

Note: This setting can only be changed when the pulses are inhibited.

p1820[0...n] Reverse the output phase sequence / Outp_ph_seq rev

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(3)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 6732
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Sets the phase sequence reversal for the motor.
If the motor does not rotate in the required direction, then the output phase sequence can be reversed using this parameter. This means that with the same setpoint, the motor direction is reversed without reversing the encoder actual value.
When a speed encoder is being used, it may be necessary to also invert the encoder actual value (p0410).

Value:
0: OFF
1: ON

Dependency: Refer to: p1821

Caution: For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.
Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.

Note: This setting can only be changed when the pulses are inhibited.
p1821 can be used to reverse the phase sequence and encoder actual value.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Setting to change the direction.
If the parameter is changed, it reverses the direction of rotation of the cylinder and the encoder actual value without changing the setpoint.

Value:
0: CW
1: CCW

Caution: Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.

- Notice:** For a drive data set changeover with differently set direction and power enable, an appropriate fault is output. The piston must be recalibrated after a direction reversal.
- Note:** The actual velocity (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).
- p1820 can be used to reverse the direction of the cylinder without reversing the encoder actual value.

	0	1	0
Description:	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: CW 1: CCW		
Caution:	Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.		
			
Notice:	An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.		
Note:	For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft. When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. 	P-Group: Motor Not for motor type: -	Units group: - Scaling: -	Unit selection: - Expert list: 1
	Min 0	Max 1	Factory setting 0
Description:	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: CW 1: CCW		
Danger: 	When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.		
Caution: 	For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15. Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". Description:	Sets the tolerance time for line phase monitoring for blocksize power units. If a line phase fault is present for longer than this tolerance time, then a corresponding fault is output.		
Notice:	When operating with a failed line phase, depending on the active power, values higher than the default value can either immediately damage the power unit or damage it over the long term.		
Note:	For the setting p1822 = maximum value, line phase monitoring is deactivated.

Description:	Sets the motor data identification and speed controller optimization. p1900 = 0: Function inhibited. p1900 = 2: Induction motors --> set p1910 = 1 and p1960 = 0 Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0 When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution. For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.		
Value:	0: Inhibited 2: Identifying motor data (at standstill)		
Dependency:	In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed. Refer to: p1272, p1300, p1910		
Notice:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). It is not permissible to activate write protection during the motor identification (p7761). During the rotating measurement it is not possible to save the parameters (p0971, p0977).		

2 Parameters

2.2 List of parameters

Note: The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for $p1300 < 20$ (U/f controls).
An appropriate alarm is output when the parameter is set.
The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.
 $p1900$ is automatically set to 0 after the motor data identification routine has been completed.

Description: Sets the motor data identification and speed controller optimization.
The motor identification should first be performed with the motor stationary ($p1900 = 1, 2$; also refer to $p1910$). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating ($p1900 = 1, 3$; also refer to $p1960$); not for $p1300 < 20$.
 $p1900 = 0$:
Function inhibited.
 $p1900 = 1$:
Induction motors --> set $p1910 = 1$ and $p1960 = 0, 1, 2$ depending on $p1300$
Permanent-magnet or separately-excited synchronous motors --> set $p1910 = 1, p1990 = 1$ and $p1960 = 0, 1, 2$ depending on $p1300$
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.
For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.
With the following power-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.
 $p1900 = 2$:
Induction motors --> set $p1910 = 1$ and $p1960 = 0$
Permanent-magnet or separately-excited synchronous motors --> set $p1910 = 1, p1990 = 1$ and $p1960 = 0$
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.
For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.
 $p1900 = 3$:
Sets $p1960 = 0, 1, 2$ depending on $p1300$
This setting should only be selected if the motor data identification was already carried out at standstill.
When the drive enable signals are present, with the next power-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

Value:

- 0: Inhibited
- 1: Identifying motor data and optimizing speed control
- 2: Identifying motor data (at standstill)
- 3: Optimizing speed control (in the rotating mode)

Dependency: In the simulation mode, the parameter cannot be written into.
When selecting the motor data identification routine, the drive data set changeover is suppressed.
Refer to: $p1272, p1300, p1910, p1960, p1990$

Notice: If there is a motor holding brake, it must be open (p1215 = 2).
 To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
 It is not permissible to activate write protection during the motor identification (p7761).
 During the rotating measurement it is not possible to save the parameters (p0971, p0977).
 p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

Note: The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).

An appropriate alarm is output when the parameter is set.

The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

Description:	The fine encoder calibration should be started during the first commissioning or after the encoder is replaced. The fine calibration starts when the pulses are enabled and performs a rotating measurement (approximately 1 minute). In this case, a setpoint speed of at least 40 % of the motor rated speed must be entered, and the torque must be less than half of the motor rated torque. The phases of the fine calibration of displayed using alarm A07976. The fine calibration ends with the calculation of p0431 for the following pulse inhibit. p1905 is automatically set to 0 at the end of the fine calibration.		
Value:	0: Inactive 90: Fine encoder calibration		
Dependency:	If the motor encoder adjustment has not been performed (p3925.4 = 0) or the encoder calibration is activated (p1990 != 0), then encoder fine calibration is prevented. Refer to: p1272, p1910, p1960, p1990		
Notice:	During encoder fine calibration, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.		
Note:	For p1905 = 90 and with the pulses not enabled, the function is only executed the next time that the pulses are enabled. When selecting the encoder fine calibration, the changeover of the motor data sets is suppressed.

Value:	-3: Accept identified parameters -2: Acknowledge encoder inversion actual value (F07993) -1: Start motor data identification without acceptance 0: Inactive/inhibit 1: Start motor data identification with acceptance		
Recommend.:	For motors with brakes, the brake should be opened before carrying out the stationary motor data identification routine (p1215 = 2) as long as this can be done without incurring any danger. The commutation angle and the direction of rotation are also determined. Motor data identification is not required for catalog motors and DRIVE-CLiQ motors. It is recommended to increase the torque accuracy or for third-party motors.		
Dependency:	Refer to: p1909, r1912, r1913, r1915, r1925, r1927, r1932, r1933, r1934, r1935, r1936, r1950, r1951, p1952, p1953		
Caution:	For motors without brake or with the brake open (p1215 = 2), for the stationary (zero speed) measurement, the motor may rotate slightly.		
			
Note:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). Motor data identification can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be powered up until the motor data identification has been completed or de-selected. After a started motor identification is ended, the parameter is automatically reset to 0. A motor data identification that is presently being carried out can be terminated with p1910 = 0.

Description:	Sets the motor data identification routine. The motor data identification routine is carried out after the next power-on command. p1910 = 1: All motor data and the drive converter characteristics are identified and then transferred to the following parameters: p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830 After this, the control parameter p0340 = 3 is automatically calculated.		
Value:	0: Inhibited 1: Complete identification (ID) and acceptance of motor data 2: Complete identification (ID) of motor data without acceptance 3: ID of the saturation characteristic and acceptance 4: ID of the saturation characteristic without acceptance 5: ID of dynamic leakage inductance Lsig (r1920) without acceptance 6: ID of lockout time (r1926) without acceptance 7: ID of stator resistance Rs (r1912) without acceptance 8: ID of stator inductance Ls (r1915) Rr (r1927) without acceptance 9: ID of rotor time constant Tr (r1913) without acceptance 10: ID of static leakage inductance Lsig (r1914) without acceptance 20: Voltage vector input 21: Voltage vector input without filter 22: Rectangular voltage vector input without filter 23: Triangular voltage vector input without filter 24: Rectangular voltage vector input with filter 25: Triangular voltage vector input with filter 26: Enter voltage vector with DTC correction 27: Enter voltage vector with AVC 28: Enter voltage vector with DTC + AVC correction		
Dependency:	"Quick commissioning" must be carried out (p0010 = 1) before executing the motor data identification routine! In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed. Refer to: p1272, p1900		
Notice:	After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next power-on command: - current flows through the motor and a voltage is present at the drive converter output terminals. - during the identification routine, the motor shaft can rotate through a maximum of half a revolution. - however, no torque torque is generated.		
Note:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). When setting p1910, the following should be observed: 1. "With acceptance" means: The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting. 2. "Without acceptance" means: The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged. 3. p1910 = 3, 4, 5 can only be selected for induction motors. 4. For settings 27 and 28, the AVC configuration set using p1840 is active. The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. At the end of the motor data identification, p1910 is automatically set to 0, if only the stationary measurement is selected, then p1900 is also reset to 0, otherwise, the rotating measurement is activated.

Notice:	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).			
Note:	Re bit 00: In order to automatically correct the control sense for the velocity controller, the complete traversing distance must be free. When required, p1820 is automatically adapted.			
	Re bit 01: The drive moves to correct the valve offset. When required, p1832 is automatically adapted.			
	Re bit 02: Full automatic piston calibration, the drive must either be referenced, or must be equipped with an absolute encoder. Further, the complete traversing distance must be free. For piston calibration, the drive is traversed to the end stop (completely inserted) with a negative search voltage (p1955[3]) and the associated absolute position entered in p0476.			
	Re bit 03: For automatic traversing range identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the complete traversing distance must be free. To prepare for the identification of the characteristic, the possible traversing range is determined. To do this, the drive is traversed to the right-hand and left-hand end stops with the search voltage (p1955[3...4]) and the position with distance reserve is entered into p1956. If there are pressure sensors, then the correct interconnection for pressure measurements A and B is checked.			
	Re bit 04: For automatic characteristic identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the free traversing range must have been entered in p1956. The drive traverses with different valve voltages and takes into account p1958.			
	Re bit 05: The drive is moved with a positive and negative velocity, and the measured stiction forces are entered into p1555 and p1556.			
	Re bit 06: The drive is traversed to both end stops. In so doing, the dead volume and the loop gain of the force control loop is measured, and entered into p0314 and p0315.			
	Re bit 08: For the automatic characteristic identification (p1959.4), the measured velocity with the measured system pressure is converted to the average system pressure; this means that system pressure fluctuations hardly influence the measurement. The system pressure as well as pressures A and B must be measured. The conversion is not performed if the pressure measurements are not available. If the pressure measurements do not measure the specified pressures, then the conversion must be deactivated in order to avoid any errors.

Note: The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).

The following parameters are influenced for the individual optimization steps:

Bit 00: None

Bit 01: p0320, p0360, p0362 ... p0369

Bit 02: p0341, p0342

Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496

Bit 04: Dependent on p1960

Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors

p1960 = 1, 3: p1458, p1459, p1470, p1472, p1496, p1400.0

p1960 = 2, 4: p1458, p1459, p1460, p1462, p1496, p1461, p1463

The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).

Re bit 11 = 1:

Bits 02, 03, 04 no longer have any effect. It makes sense to set bit 11 if the speed controller and it's adaptation were already set before the measurement.

Re bit 12 = 1:

The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy, the oscillation test is completely eliminated.

Re bit 13 = 1:

After the measurement has been completed, the system immediately goes into closed-loop speed controlled operation.

Notice:	The drive moves after data identification with movement has been activated and enabled. In this case the force limiting is not active. If it is not permissible that the complete traversing range is traversed, then the following must be executed before the start: - deselect automatic traversing range detection (p1959.3 = 0). - deselect automatic piston calibration (p1959.2 = 0). - calibrate the piston manually. - manually enter the traversing range limits (p1956). For the identification of the characteristic (p1959.4), the velocities are traversed up to the maximum velocity, depending on the setting in p1955[0...1].		
Note:	The identification is executed when the enable signals are activated. After the enable signals have been deactivated, data identification is interrupted, and is continued when the enable signals are activated. In order to maintain the direction convention, for a positive valve voltage setpoint before inversion (r0070), the piston must move from the A side towards the B side (extend outwards) before data identification is started. If required, the output voltage can be inverted with p1820 for adaptation.

Description:	Sets the rotating measurement. The rotating measurement is carried out after the next power-on command. The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300). p1300 < 20 (U/f open-loop control): It is not possible to select rotating measurement or speed controller optimization. p1300 = 20, 22 (encoderless operation): Only rotating measurement or speed controller optimization can be selected in the encoderless mode. p1300 = 21, 23 (operation with encoder): Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.			
Value:	0: Inhibited 1: Rotating measurement in encoderless operation 2: Rotating measurement with encoder 3: Speed controller optimization in encoderless operation 4: Speed controller optimization with encoder			

2 Parameters

2.2 List of parameters

- Dependency:** Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done.
 In the simulation mode, a value of 1 cannot be written into the parameter.
 When selecting the rotating measurement, the drive data set changeover is suppressed.
 When selecting rotating measurement (with the exception for p1959.13 = 1) the following BICO parameters are set to standard values, and after the measurement has been completed, are reset back to the original parameter assignments:
 p1020 ... p1023, p1070, p1075, p1138, p1139, p1140 ... p1143, p1155, p1160, p1437, p1476, p1477
 Refer to: p1272, p1300, p1900, p1959, p1967, r1968
- Danger:**  For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.
- Notice:** If there is a motor holding brake, it must be open (p1215 = 2).
 To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
 During the rotating measurement it is not possible to save the parameters (p0971, p0977).
- Note:** When the rotating measurement is activated, it is not possible to save the parameters (p0971, p0977).
 Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.
 The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.
 For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472).
 Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.

r1961[0...511] Valve identification voltage characteristic / Valve ID char U

	Min	Max	Factory setting
	10 [%]	75 [%]	40 [%]
Description:	Sets the speed for the identification of the moment of inertia and the vibration test. Induction motor: The percentage value is referred to p0310 (rated motor frequency). Synchronous motor: The percentage value is referred to the minimum from p0310 (rated motor frequency) and p1082 (maximum speed).		
Dependency:	Refer to: p0310, p1959		
Note:	In order to calculate the inertia, sudden speed changes are carried out - the specified value corresponds to the lower speed setpoint. This value is increased by 20 % for the upper speed value. The q leakage inductance (refer to p1959.5) is determined at zero speed and at 50 % of p1965 - however, with a maximum output frequency of 15 Hz and at a minimum of 10% of the rated motor speed.

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [%]	400 [%]	100 [%]
Description:	Sets the dynamic response factor for speed controller optimization. After optimization, the dynamic response achieved is displayed in r1968.		
Dependency:	Refer to: p1959, r1968		
Note:	For a rotating measurement, this parameter can be used to optimize the speed controller. p1967 = 100 % --> speed controller optimization according to a symmetric optimum. p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower). If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be deactivated and the measurement repeated.

Description:	Sets the pole position identification technique.				
Value:	0: Saturation-based 1st + 2nd harmonics 1: Saturation-based 1st harmonics 4: Saturation based 2-stage 10: Motion-based 20: Elasticity-based 99: No technique selected				
Dependency:	Refer to: p0325, p0329, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996, p1997, p3090, p3091, p3092, p3093, p3094, p3095, p3096, r3097				
Notice:	If the incorrect technique is applied, this can cause the motor to accelerate in an uncontrolled fashion. Under the following conditions, the integral time must be disabled (p1996 = 0): - p1980 = 10 (motion-based) - motor encoder with track A/B sq-wave (p0404.3 = 1) - p0430.20 = 0 (flank time measurement) Once the integral time has been disabled, the motion is increased during the identification (a minimum of 90 ° electrical). As a result of this, the maximum distance (p1981) must also be increased.				

Note: PolID: Pole position identification
 When commissioning a catalog motor, the technique is automatically selected depending on the motor type being used.
 The following applies for 1FN3 motors:
 A technique with 2nd harmonic may not be used (do not use p1980 = 0, 4).
 For 1FK7 motors, the following applies:
 A two-stage technique may not be used (do not use p1980 = 4).
 The automatically set value in p0329 may not be changed.

Recommend.:	Re p1982 = 1: This is used for synchronous motors with motor encoder without absolute data. The information/data regarding the absolute commutation angle is supplied via a track C/D, Hall sensors, an absolute encoder or from the pole position identification routine. Re p1982 = 2: This is used for synchronous motor with motor encoder with absolute data to check this data. For VECTOR, the following applies: With p1982 = 2, each time the pulses are enabled it is checked whether the absolute position supplied from the encoder does not exceed a deviation of 45 degrees to the identified pole wheel position. With separately-excited synchronous motors (p0300 = 5), pole position identification cannot be selected if an encoder with position data is used (e.g. SSI encoder).

SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: Integer16 P-Group: Motor identification Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder. The function acts on the active motor data set. When adjusting the encoder, the angular commutation offset is determined and transferred into p0431. Alarm A07971 is output while the angular commutation offset is being determined. p1990 is automatically set to 0 after the angular commutation offset has been determined. p1990 = 0: De-activated p1990 = 1: Activated with transfer		
Dependency:	Refer to: p0325, p0329, p0431, p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1999		
Danger:	Re recommendation 3:  When performing this measurement there is a danger of coming into contact with system parts that are at a high (hazardous) electrical voltage. This measurement may only be performed by authorized service personnel.		
Notice:	For p1990 = 1 and with the pulses not enabled, the function is only executed the next time that the pulses are enabled. In order to prevent an incorrect orientation of the electrical pole position (uncontrolled motor movement), the automatically determined angular commutation offset (p0431) should, for reasons of safety, be checked using one of the following recommendations: Recommendation 1: Set encoderless operation (p1300 = 20 or p1404 = 0), de-select pole position identification (p1982 = 0), operate under no-load conditions with a speed > p1755, correct the actual value inversion (p0410.0) (e.g. r0061 = r0063), read the angular error in r1778; the result in r1778 should be approximately 0, for r1778 > 2 degrees, add the value to p0431 - taking into account the sign - and enter in p0431. Recommendation 2: Set the current limit to 0 (p0640 = 0), activate travel to fixed stop (p1545 = 1), record r0089[0] (phase voltage) and r0093 (electrically scaled pole position) (e.g. trace) while the motor is externally moved; in this case, the rising zero crossover of the phase voltage must coincide with the 360 ° --> 0 ° step (jump) from r0093.		

2 Parameters

2.2 List of parameters

Recommendation 3:

Measure the phase voltage U (measure phase U with respect to the virtual star point using 3 resistors) and r0093 (electrically scaled pole position); the rising zero crossover of the phase voltage must coincide with the 360 ° --> 0 ° step (jump) of r0093.

Recommendation 4:

Determine the average value from several results of a pole position identification routine executed as test (p1983) at various electrical angles and add the value to p0431 - taking into account the sign and enter into p0431.

Note:

If fault F07414 is present, the following applies:

First set p1990 to 1, then acknowledge the fault and then issue the enable signals.

Description:	Sets the scaling for the runtime of the automatic encoder calibration and of the pole position identification technique in which the current is injected.		
Dependency:	Refer to: p0341, p0342		
Caution:	For p1999 > 100 % (setting large moments of inertia) the following applies: There is no locked rotor monitoring (F07970 fault value 2). The plausibility check of the encoder signal (F07970 fault value 4) only checks the sign.		
Note:	For high moments of inertia, it is practical to scale the runtime of the calibration higher.

2.2 List of parameters

Notice: If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records).
 Example:
 p2002 = 100 A
 Reference quantity 100 A corresponds to 100 %
 p0305[0] = 100 A
 Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current
 p0305[1] = 50 A
 Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity.
 Example:
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

The reference acceleration is calculated as follows:
Reference speed (p2000) converted from 1/min to 1/s divided by 1 s
--> p2007 = p2000 [rpm] / (60 [s/min] * 1 [s])

Description:	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.			
Value:	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints			
Recommend.:	Do not change the setting p2037 = 0.			
Note:	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

	00	Setpoint failure	Yes	No
	01	Clock cycle synchronous operation active	Yes	No
	02	Fieldbus oper	Yes	No
Dependency:	Refer to: p2044			
Note:	When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.			
p2044	IF1 PROFIdrive fault delay / IF1 PD fault delay			
A_INF, B_INF, ENC, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0 [s]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100 [s]	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting 0 [s]	
Description:	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that is is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).			
Dependency:	Refer to: r2043			
p2045	CI: PB/PN clock synchronous controller sign-of-life signal source / PB/PN ctrSoL S_src			
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T Data type: Unsigned32 / Integer16 P-Group: Communications Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting 0	
Description:	Connector input for the sign-of-life of the clock synchronous PROFIBUS/PROFINET controller. The sign-of-life is expected at bits 12 to 15. Bits 0 to 11 are not evaluated. The sign-of-life signal is normally received in PZD4 (control word 2) from the controller.			
Dependency:	Refer to: p0925, r2065			
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.			

p2047	PROFIBUS additional monitoring time / PB suppl t_monit			
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: U, T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 20000 [ms]	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting 0 [ms]	
Description:	Sets the additional monitoring time to monitor the process data received via PROFIBUS. Enables short bus faults to be compensated. If no process data is received within this time, then an appropriate message is output.			
Recommend.:	In the isochronous mode, the additional monitoring time should not be set.			
Note:	For controller STOP, the additional monitoring time is not effective.			
p2048	IF1 PROFIdrive PZD sampling time / IF1 PZD t_sample			
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 1.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 16.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4.00 [ms]	
Description:	Sets the sampling time for the cyclic interface 1 (IF1).			
Note:	The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set. For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).			
p2049	PROFIdrive isochronous operation asynchronous participation / Isochron async			
SERVO, SERVO_I_AC, VECTOR, VECTOR_I_AC	Can be changed: C1(3) Data type: Integer16 P-Group: Closed-loop control Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0	
Description:	Setting for asynchronous participation in isochronous operation. Re p2049 = 1: The axis only asynchronously participates in isochronous PROFIdrive operation. The control sampling times of this axis are not included in the bus cycle time check (Tdp), in the time of the actual value sensing (Ti) and in the time of the setpoint sensing (To). Re p2049 = 0: No effect on the setting in p0092.			
Value:	0: No 1: Yes			
Dependency:	Refer to: p0092			
Caution:	Restrictions for asynchronous participation in isochronous PROFIBUS operation:			
	- the setpoints are effective at undefined instant in time (deviating from To). As a consequence, interpolating operation with other axes is not possible, for example. - the actual values are read at undefined instant in time (deviating from Ti). As a consequence, the actual values cannot be used to control other axes, for example.

Description:	Status display for the PROFIBUS interface.		
Value:	0: OFF 1: No connection (search for baud rate) 2: Connection OK (baud rate found) 3: Cyclic connection with master (data exchange) 4: Cyclic data OK		
Note:	<p>Re r2054 = 3: In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation: - No setpoints are being received as the PROFIBUS master is in the STOP condition. Only for clock-cycle synchronous operation, the following applies: - The drive is not in synchronism as the global control (GC) has an error.</p> <p>Re r2054 = 4: In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free. This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.</p>

--	--	---	--

Description: Displays the last parameter received from the PROFIBUS/PROFINET controller for clock synchronism. The parameters for clock synchronism are created when configuring the bus and are transferred at the start of cyclic operation from the controller to the device.

Index: [0] = Clock synchronous mode activated
[1] = Bus cycle time (Tdp) [μs]
[2] = Master cycle time (Tmapc) [μs]
[3] = Instant of actual value acquisition (Ti) [μs]
[4] = Instant of setpoint acquisition (To) [μs]
[5] = Data exchange interval (Tdx) [μs]
[6] = PLL window (Tpll-w) [1/12 μs]
[7] = PLL delay time (Tpll-d) [1/12 μs]

Description: Displays how often the sign-of-life from the clock synchronous PROFIBUS/PROFINET controller last failed. An appropriate fault is output when the tolerance, specified in p0925, is exceeded.

- 1: OFF1
- 2: OFF2
- 3: OFF3
- 5: STOP2
- 6: Internal armature short-circuit / DC braking
- 7: ENCODER (p0491)

Dependency: The fault is selected and the required response is set under the same index.
Refer to: p2100

Notice: For the following cases, it is not possible to re-parameterize the fault response to a fault:

- Fault number does not exist (exception value = 0).
- Message type is not "fault" (F).
- Fault response is not permissible for the set fault number.

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").

Example:

F12345 and fault response = OFF3 (OFF1, OFF2, NONE)

--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.

Re value = 1 (OFF1):

Braking along the ramp-function generator down ramp followed by a pulse inhibit.

Re value = 2 (OFF2):

Internal/external pulse inhibit.

Re value = 3 (OFF3):

Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):

n_set = 0

Re value = 6 (armature short-circuit, internal/DC braking):

The value can only be set for all motor data sets when p1231 = 3, 4.

a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed.

b) For induction motors (p0300 = 1xx), a DC braking is initiated.

Re value = 7 (ENCODER (p0491)):

The fault response set in p0491 is executed if applicable.

Note:

IASC: Internal Armature Short Circuit

DCBRK: DC braking

p2108[0...n]	BI: External fault 3 / External fault 3		
A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Units group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p3110, p3111, p3112		
Note:	An external fault is triggered with a 1/0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		
p2108	BI: External fault 3 / External fault 3		
CU_I, CU_I_D410, CU_LINK, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM54F_MA, TM54F_SL	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p3110, p3111, p3112		
Note:	An external fault is triggered with a 1/0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		
r2109[0...63]	Fault time removed in milliseconds / t_flt resolved ms		
All objects	Can be changed: - Data type: Unsigned32 P-Group: Messages Not for motor type: - Min - [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [ms]	Access level: 3 Func. diagram: 8050, 8060 Unit selection: - Expert list: 1 Factory setting - [ms]
Description:	Displays the system runtime in milliseconds when the fault was removed.		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2114, r2130, r2133, r2136, r3115, r3120, r3122		
Notice:	The time comprises r2136 (days) and r2109 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the fault buffer and the assignment of the indices is shown in r0945.		

r2110[0...63]	Alarm number / Alarm number		
All objects	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	This parameter is identical to r2122.		
p2111	Alarm counter / Alarm counter		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Number of alarms that have occurred after the last reset.		
Dependency:	When p2111 is set to 0, the following is initiated:		
	- all of the alarms of the alarm buffer that have gone [0...7] are transferred into the alarm history [8...63].		
	- the alarm buffer [0...7] is deleted.		
	Refer to: r2110, r2122, r2123, r2124, r2125		
Note:	The parameter is reset to 0 at POWER ON.		
p2112[0...n]	BI: External alarm 1 / External alarm 1		
A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: CDS, p0170	Func. diagram: 2546
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source for external alarm 1.		
Note:	An external alarm is triggered with a 1/0 signal.		
p2112	BI: External alarm 1 / External alarm 1		
CU_I, CU_I_D410, CU_LINK, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM54F_MA, TM54F_SL	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source for external alarm 1.		
Note:	An external alarm is triggered with a 1/0 signal.		

2 Parameters

2.2 List of parameters

r2114[0...1]	System runtime total / Sys runtime tot		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Unsigned32 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the total system runtime for the drive unit. The time comprises r2114[0] (milliseconds) and r2114[1] (days). After r2114[0] has reached a value of 86.400.000 ms (24 hours) this value is reset and r2114[1] is incremented.		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r0948, r2109, r2123, r2125, r2130, r2136, r2145, r2146		
Note:	The time in r2114 is used to display the times for faults and alarms. When the electronic power supply is switched out, the counter values are saved. After the drive unit is powered up, the counter continues to run with the last value that was saved.		
<hr/>			
p2116[0...n]	BI: External alarm 2 / External alarm 2		
A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Units group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 2.		
Note:	An external alarm is triggered with a 1/0 signal.		
<hr/>			
p2116	BI: External alarm 2 / External alarm 2		
CU_I, CU_I_D410, CU_LINK, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM54F_MA, TM54F_SL	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 2.		
Note:	An external alarm is triggered with a 1/0 signal.		
<hr/>			
p2117[0...n]	BI: External alarm 3 / External alarm 3		
A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Units group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 3.		
Note:	An external alarm is triggered with a 1/0 signal.		

p2117	BI: External alarm 3 / External alarm 3		
CU_I, CU_I_D410, CU_LINK, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM54F_MA, TM54F_SL	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 3.		
Note:	An external alarm is triggered with a 1/0 signal.		
p2118[0...19]	Change message type message number / Chng type msg_no		
All objects	Can be changed: U, T Data type: Unsigned16 P-Group: Messages Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 65535	Access level: 3 Func. diagram: 8050, 8075 Unit selection: - Expert list: 1 Factory setting 0
Description:	Selects faults or alarms for which the message type should be changed.		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2119		
Note:	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.		
p2119[0...19]	Change message type type / Change type type		
All objects	Can be changed: U, T Data type: Integer16 P-Group: Messages Not for motor type: - Min 1	Calculated: - Dyn. index: - Units group: - Scaling: - Max 3	Access level: 3 Func. diagram: 8050, 8075 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the message type for the selected fault or alarm.		
Value:	1: Fault (F) 2: Alarm (A) 3: No message (N)		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2118		
Note:	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone. The message type can only be changed for messages with the appropriate identification (exception, value = 0). Example: F12345(A) --> Fault F12345 can be changed to alarm A12345. In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.		

r2120	CO: Sum of fault and alarm buffer changes / Sum buffer changed		
All objects	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the sum of all of the fault and alarm buffer changes in the drive unit.		
Dependency:	Refer to: r0944, r2121		
r2121	CO: Counter alarm buffer changes / Alrm buff changed		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	This counter is incremented every time the alarm buffer changes.		
Dependency:	Refer to: r2110, r2122, r2123, r2124, r2125		
r2122[0...63]	Alarm code / Alarm code		
All objects	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the number of alarms that have occurred.		
Dependency:	Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Notice:	The properties of the alarm buffer should be taken from the corresponding product documentation.		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). Alarm buffer structure (general principle): r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest) ... r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest) When the alarm buffer is full, the alarms that have gone are entered into the alarm history: r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest) ... r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)		
r2123[0...63]	Alarm time received in milliseconds / t_alarm rcv ms		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the system runtime in milliseconds when the alarm occurred.		
Dependency:	Refer to: r2110, r2114, r2122, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Notice:	The time comprises r2145 (days) and r2123 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		

r2124[0...63]	Alarm value / Alarm value		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays additional information about the active alarm (as integer number).		
Dependency:	Refer to: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		
r2125[0...63]	Alarm time removed in milliseconds / t_alarm res ms		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the system runtime in milliseconds when the alarm was cleared.		
Dependency:	Refer to: r2110, r2114, r2122, r2123, r2124, r2134, r2145, r2146, r3121, r3123		
Notice:	The time comprises r2146 (days) and r2125 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		
p2126[0...19]	Change acknowledge mode fault number / Chng ackn F_no		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8075
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

Description:	Selects the faults for which the acknowledge mode is to be changed		
Dependency:	Selects the faults and sets the required acknowledge mode realized under the same index Refer to: p2127		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		
p2127[0...19]	Change acknowledge mode mode / Chng ackn mode		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 8050, 8075

	1	3	1
Description:	Sets the acknowledge mode for selected fault.		
Value:	1: Acknowledgment only using POWER ON 2: Ack IMMEDIATELY after the fault cause has been removed 3: Acknowledgement only for PULSE INHIBIT		
Dependency:	Selects the faults and sets the required acknowledge mode realized under the same index Refer to: p2126		

2 Parameters

2.2 List of parameters

- Notice:** It is not possible to re-parameterize the acknowledge mode for a fault in the following cases:
- Fault number does not exist (exception value = 0).
 - Message type is not "fault" (F).
 - Acknowledge mode is not permissible for the set fault number.
- Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
- The acknowledge mode can only be changed for faults with the appropriate identification.
- Example:
 F12345 and acknowledge mode = IMMEDIATELY (POWER ON)
 --> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

Note: Re bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present" or "alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The binector input is automatically pre-assigned to r1199.2. The following applies for SERVO: The pre-assignment using the automatic calculation of the motor/control parameters in the drive (p0340 = 1, 3, 5) is only realized if, at the instant of the calculation, the "setpoint channel" function module is active (r0108.8 = 1). If the calculation in p0340 is not selected when downloading parameters, then the parameter is not preassigned.

Dependency:	Refer to: r2197																											
Note:	Re bit 00: Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act). Re bit 01: When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190). Re bit 03: When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions.																											

Re bit 15:

The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out.

If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

	15	Automatic parameterization carried out (p0340 = 1, p3900 > 0)	Yes	No
Dependency:	Refer to: r2197			
Note:	Re bit 00: Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act). Re bit 01: When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190). Re bit 03: When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions. Re bit 15: The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

Description:	Sets the hysteresis velocity (bandwidth) for the signal "v_act > v_max" (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		
Notice:	For p0322 = 0, the following applies: p2162 <= 0.1 * p0311 For p0322 > 0, the following applies: p2162 <= 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
Note:	For a negative velocity limit (r1087) the hysteresis is effective below the limit value and for a positive velocity limit (r1084) above the limit value.		

p2162[0...n]	Hysteresis speed $n_{act} > n_{max}$ / Hyst $n_{act} > n_{max}$

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 60000.00 [rpm]	Factory setting 0.00 [rpm]
Description:	Sets the hysteresis speed (bandwidth) for the signal "n_act > n_max" (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		
Notice:	For p0322 = 0, the following applies: p2162 <= 0.1 * p0311 For p0322 > 0, the following applies: p2162 <= 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
Note:	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

	0.000 [s]	65.000 [s]	1.000 [s]
Description:	Sets the delay time for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2175, r2198		
Note:	The following applies for sensorless vector control: At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably. As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

	0.00 [m/min]	1000.00 [m/min]	0.05 [m/min]

Description: Sets the speed/torque envelope curve for load monitoring.
The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds:
p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower)
p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower)

Dependency:	Refer to: r2231, p2240			
Notice:	The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion: - Firmware with V2.3 or higher. - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).			
Note:	Re bit 00: 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240. 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.			

2 Parameters

2.2 List of parameters

Re bit 02:

0: Without initial rounding-off

1: With initial rounding-off.

The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).

It is calculated as follows:

$$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$

The jerk is effective until the maximum acceleration is reached ($a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration.

The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:

0: Non-volatile data save de-activated.

1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).

Re bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

Description:	Displays the effective setpoint after the internal ramp-function generator for the motorized potentiometer of the technology controller.			
Dependency:	Refer to: r2245			
p2252	Technology controller configuration / Tec_ctrl config			
SERVO (Tech_ctrl), SERVO_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR (Tech_ctrl), VECTOR_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned16 P-Group: Modulation Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0111 bin	
Description:	Sets the configuration of the technology controller.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Ramp-up/down time independent of setpoint sign	Yes	No
	01	Integrator independent of Kp	Yes	No
	02	Output signal without ramp active	Yes	No
	03	Actual value limiting	Yes	No
Dependency:	Refer to: p2257, p2258, p2267, p2268, p2280, p2285			
Note:	Re bit 00 = 0: The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle. Re bit 00 = 1: When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time. Re bit 01 = 0: The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time). Re bit 01 = 1: The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0. Re bit 02 = 0: When the PID controller is de-activated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293. Re bit 02 = 1: When the PID controller is de-activated via p2200, the output signal r2294 is set directly to zero. Re bit 03 = 0: The actual values are not limited by p2267 and p2268. Re bit 03 = 1: The actual values are limited by p2267 and p2268.

Description:	Setting to invert the fault signal of the technology controller. The setting depends on the type of control loop.		
Value:	0: No inversion 1: Inversion		
Caution:	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			

Note: The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:
The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).

If value = 1:
The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

Value: 0: No encoder
1: Encoder 1
2: Encoder 2
3: Encoder 3

Dependency: Refer to: p0187, p0188, p0189

Notice: For the setting p2502 = 0 (no encoder), closed-loop position control is not possible. This setting is only practical as supportive measure to implement encoderless closed-loop speed control (e.g. if the motor encoder is defective).

Note: The assigned encoder (p2502 = 1, 2, 3) must be allocated an encoder data set (p0187, p0188, p0189).

Note:	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the pre-control is active. Increasing p2506 counteracts this behavior.

p2507[0...n]		LR absolute encoder adjustment status / Abs_enc_adj stat		
SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Integer16 P-Group: Closed loop position control Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Units group: - Scaling: - Max 3	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 1	
Description:	Activating the adjustment and display of the status of the adjustment for absolute encoders.			
Value:	0: Error occurred while adjusting 1: Absolute encoder not adjusted 2: Absolute encoder not adjusted and encoder adjustment initiated 3: Absolute encoder adjusted			
Dependency:	Refer to: p2525, p2598, p2599, p2733			
Caution:	For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after powering down/powering up. In this range, it is only permissible that the encoder overflows. After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system. If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443. There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after powering down/powering up. When adjusting, the position actual value is set to the reference point.			
Note:	The encoder adjustment is initiated with p2507 = 2. The status is displayed using the other values. In order to permanently save the determined position offset (p2525) and the DDS number (p2733), they must be saved in a non-volatile fashion (p0971, p0977). This adjustment can only be initiated for an absolute encoder.

Description:	Sets the behavior of the position actual value preprocessing for the position controller for a DDS changeover. Re p2519 = 1: In the following cases, for a DDS changeover, the actual position actual value becomes invalid and the reference point is reset: - the EDS effective for the closed-loop position control changes. - the encoder assignment changes (p2502). - the mechanical relationships change (p2503 ... p2506). - the direction of rotation changes (p1821). For absolute encoders, the status of the adjustment (p2507) is also reset if the same absolute encoder remains selected for the closed-loop position control, but the mechanical relationships or the direction of rotation have changed. In the operation state, in addition, a fault (F07494) is generated.			
Notice:	The remaining setting values are intended for expanded functionality.			
Note:	The behavior for a DDS changeover is determined using the value of p2519 in the target data set.

SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Integer32 P-Group: Closed loop position control Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 4025 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Display and connector output for the dynamic following error. This value is the deviation, corrected by the velocity-dependent component, between the position setpoint and the position actual value.		
Note:	For p2534 >= 100 % (pre-control activated) the following applies: The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input. For 0 % < p2534 < 100 % (pre-control activated) or p2534 = 0 % (pre-control de-activated) the following applies: The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller.		
r2564	CO: LR force pre-control value / F_prectrl val

Description:	Display and connector output for the torque precontrol value.		
Dependency:	Refer to: p1511, p1512		
Note:	The torque pre-control value is the derivation over time of the speed pre-control value and is referred to a moment of inertia of 1 kgm ² /2 PI. When using the pre-control, then this should be evaluated corresponding to the actual moment of inertia.		
r2565	CO: LR following error actual / Following err act

Note: This display parameter is used for diagnostics even when the pre-control is inactive (p2534 = 0%).

p2567[0...n] LR force pre-control mass / F_prectrl mass			
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4015
	P-Group: Closed loop position control	Units group: 27_1	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000000 [kg]	Max 10000.000000 [kg]	Factory setting 1.000000 [kg]

Description: Sets the mass for the force pre-control.

Dependency: Refer to: p2534, r2564

Note: When calculating the force pre-control value (r2654), the derivation over time of the speed pre-control value is multiplied by p2567.

For reasons associated with the compatibility to earlier firmware releases, the factory setting for p2567 = 1 kg. This means that CO: r2564 remains, as standard, the derivation over time of the velocity pre-control value and refers, as before, to a weight of 1 kg. For force pre-control, the mass can now be directly entered into p2567 (instead of subsequently evaluating the pre-control value).

p2567[0...n] LR torque pre-control moment of inertia / M_prectrl M_inertia			
SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4015
	P-Group: Closed loop position control	Units group: 25_1	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000000 [kgm ²]	Max 100000.000000 [kgm ²]	Factory setting 0.159155 [kgm ²]

Description: Sets the moment of inertia for the torque pre-control.

Dependency: Refer to: p2534, r2564

Note: When calculating the torque pre-control value (r2654), the time derivation of the speed pre-control value is multiplied by $2 \text{ PI} * \text{p2567}$.

For reasons associated with the compatibility to earlier firmware versions, the factory setting for p2567 = $1 \text{ kgm}^2/2 \text{ PI}$. This means that CO: r2564 remains as standard the derivation over time of the speed pre-control value and is referred, as before, to a moment of inertia of $1 \text{ kgm}^2/2 \text{ PI}$. For torque pre-control, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the pre-control value).

Description:	Sets the signal source for the STOP cam in the negative direction of travel.		
Recommend.:	Set the OFF3 ramp-down time (p1135), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available. Sets message 07491 as alarm (A07491): Set the maximum deceleration (p2573), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available.		
Dependency:	Refer to: p1135, p2568, p2570, p2573, r2684		
Caution:	The STOP cams are low active. Sets message 07491 as fault (F07491): For a 0 signal, the axis is stopped with the OFF3 ramp-down time (p1135), status signal r2684.13 is set to 1, saved and the appropriate fault is output. After the fault has been acknowledged, only motion moving away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.13 is set to 0. Sets message 07491 as alarm (A07491): For a 0 signal, the axis is stopped with the maximum deceleration (p2573), status signal r2684.13 is set to 1, saved and the appropriate alarm is output. Only motion away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.13 is set to 0 and the alarm is deleted.

Description:	Sets the signal source for the STOP cam in the positive direction of travel.		
Recommend.:	Set the OFF3 ramp-down time (p1135), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available. Sets message 07492 as alarm (A07492): Set the maximum deceleration (p2573), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available.		
Dependency:	Refer to: p1135, p2568, p2569, p2573, r2684		
Caution:	The STOP cams are low active.		
	Sets message 07492 as fault (F07492): For a 0 signal, the axis is stopped with the OFF3 ramp-down time (p1135), status signal r2684.14 is set to 1, saved and the appropriate fault is output. After the fault has been acknowledged, only motion moving away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.14 is set to 0. 	Min	Max	Factory setting
	1 [1000 LU/min]	40000000 [1000 LU/min]	30000 [1000 LU/min]
Description:	Sets the maximum velocity for the "basic positioner" function (EPOS).		
Dependency:	Refer to: r1084, r1087, p2503, p2504, p2505, p2506		
Note:	The maximum velocity is active in all of the operating modes of the basic positioner. The maximum velocity for the basic positioner should be aligned with the maximum speed/velocity of the speed/velocity controller: Rotary encoders: $p2571[1000 \text{ LU/min}] = \min(r1084 , r1087)[\text{rpm}] \times p2505/p2504 \times p2506/1000$ Linear encoders: $p2571[1000 \text{ LU/min}] = \min(r1084 , r1087)[\text{m/min}] \times p2503/10[\text{m}]$

	Min	Max	Factory setting
	1 [1000 LU/s ²]	2000000 [1000 LU/s ²]	100 [1000 LU/s ²]
Description:	Sets the maximum acceleration for the "basic positioner" function (EPOS).		
Dependency:	Refer to: p2619, p2644		

Note: The maximum acceleration appears to exhibit jumps (without jerk).
 "Traversing blocks" operating mode:
 The programmed acceleration override (p2619) acts on the maximum acceleration.
 "Direct setpoint input/MDI" mode:
 The acceleration override is effective (p2644, 4000 hex = 100 %).
 "Jog" and "search for reference" modes
 No acceleration override is active. The axis starts with the maximum acceleration.

p2573	EPOS maximum deceleration / -a_max		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

	Min	Max	Factory setting
	1 [1000 LU/s ²]	2000000 [1000 LU/s ²]	100 [1000 LU/s ²]

Description: Sets the maximum deceleration for the "basic positioner" function (EPOS).
Dependency: Refer to: p2620, p2645
Note: The maximum deceleration appears to exhibit jumps (without jerk).
 "Traversing blocks" operating mode:
 The programmed deceleration override (p2620) acts on the maximum deceleration.
 "Direct setpoint input/MDI" mode:
 The deceleration override is effective (p2645, 4000 hex = 100 %).
 "Jog" and "search for reference" modes
 No deceleration override is effective. The axis breaks with the maximum deceleration.

p2574	EPOS jerk limiting / Jerk lim		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/s ³]	100000000 [1000 LU/s ³]	10000 [1000 LU/s ³]

Description: Sets the jerk limiting
Dependency: Refer to: p2572, p2573, p2575
Note: The jerk limiting is internally converted into a jerk time as follows:

$$\text{Jerk time } T_r = \max(p2572, p2573) / p2574$$
 The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]).
 The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573).
 For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values.
 If, in the traversing profile, the acceleration time without jerk limiting is less than the jerk time T_r , then the motion with jerk limiting is not optimum from a time perspective.
 For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk.
 CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle.
 For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time.

SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 1 Func. diagram: 3630, 3635 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to activate modulo correction.		
Dependency:	Refer to: p2576		
Note:	When the signal state changes at the binector input, this only becomes effective in the "ready for switching on" state. Selecting modulo correction: The actual position setpoint in the modulo range is corrected. The position actual value differs from the position setpoint by the following error and can also leave the modulo range. De-selecting modulo correction: It is based on the actual position actual value.

2.2 List of parameters

Notice: Target position for relative positioning outside software limit switch:
The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated.
Target position for absolute positioning outside software limit switch:
In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output.
Axis outside the valid traversing range:
If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

Note: The traversing range can also be limited using STOP cams.

p2583	EPOS backlash compensation / Backlash comp		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -200000 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 200000 [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting 0 [LU]

Description: Sets the amount of play (backlash) for positive or negative play.
0: The backlash compensation is de-activated.
> 0: Positive backlash (normal case)
When the direction is reversed, the encoder actual value leads the actual value.
< 0: Negative backlash
When the direction is reversed, the actual value leads the encoder actual value.

Dependency: If a stationary axis is referenced by setting the reference point, or an adjusted with absolute encoder is powered up, then the setting of p2604 is relevant for entering the compensation value.
p2604 = 1:
Traveling in the positive direction -> A compensation value is immediately entered.
Traveling in the negative direction -> A compensation value is not entered
p2604 = 0:
Traveling in the positive direction -> A compensation value is not entered
Traveling in the negative direction -> A compensation value is immediately entered.
When again setting the reference point (a referenced axis) or for "flying referencing", p2604 is not relevant but instead the history of the axis.

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to start the "search for reference" or "flying referencing". BI: p2595 = 0/1 signal Referencing is started. BI: p2595 = 1/0 signal Referencing is interrupted.		
Dependency:	Refer to: p2597, p2598, p2599, r2684		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	Search for reference (BI: p2597 = 0 signal): The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed. With the start, where relevant, the state signal "reference point set" (r2684.11) is reset. Flying referencing (BI: p2597 = 1 signal): With the start, the state signal "reference point set" (r2684.11) is not reset.

Description:	Sets the signal source for the "set reference point".		
Dependency:	Refer to: p2598, p2599, r2684		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	Reference point setting is effective in the following operating states: - in the basic state. - for FIXED STOP with progress condition END (corresponds to the initial state). - for traversing block interrupted via BI: p2640 = 0 signal (intermediate stop). - for EPOS not enabled (BI: p2656 = 0 signal) and position actual value valid (BI: p2658 = 1 signal).

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to select referencing type. 1 signal: Flying referencing 0 signal: Search for reference		
Dependency:	Refer to: p2595		
Note:	Referencing is activated as follows: - Select the referencing type (BI: p2597) - Start referencing (BI: p2595 = 0/1 signal)

p2598[0...3]	CI: EPOS reference point coordinate signal source / Ref_pt coord S_src		
SERVO (EPOS, Pos ctrl), SERVO_AC (EPOS, Pos ctrl), VECTOR (EPOS, Pos ctrl), VECTOR_AC (EPOS, Pos ctrl)	Can be changed: T Data type: Unsigned32 / Integer32 P-Group: Closed loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 1 Func. diagram: 3612, 3614 Unit selection: - Expert list: 1 Factory setting [0] 2599[0] [1] 0 [2] 0 [3] 0

Description: Sets the signal source for the reference point coordinate.
 This value is used as reference for the following referencing operations:

- search for reference
- set reference point
- flying referencing
- absolute value adjustment

Index: [0] = CI-loop pos ctrl
 [1] = Encoder 1
 [2] = Encoder 2
 [3] = Encoder 3

Dependency: Refer to: p2502, p2507, p2595, p2596, p2597, p2599

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following applies:
 Incremental measuring system:
 After the reference point is reached, the drive accepts the actual axis position from the position received via the connector input p2598[0].
 Absolute encoder:
 When adjusting the encoder, the position received via the connector input is set as the actual axis position. The position offset to the actual encoder value is displayed in p2525.

p2599	CO: EPOS reference point coordinate value / Ref_pt coord val		
SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Integer32 P-Group: Closed loop position control Not for motor type: - Min -2147482648 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 0 [LU]

Description: Sets the position value for the reference point coordinate.
 This value is set as the actual axis position after referencing or adjustment.

Dependency: Refer to: p2507, p2525, p2595, p2596, p2597, p2598

p2600	EPOS search for reference reference point offset / Ref_pt offset		
A_INF, B_INF, R_INF, S_INF, SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -2147482648 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 0 [LU]

Description: Sets the reference point offset for search for reference.

Dependency: Refer to: p2598

p2601	EPOS flying referencing inner window / Inner window		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3614 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the inner window for flying referencing. Value = 0: The evaluation of the inner window is de-activated.		
Dependency:	Refer to: p2597, p2602, r2684		
Notice:	The inner window must be set so that it is smaller than the outer window.		
Note:	If the difference between the reference point coordinate and detected actual position is less than the inner window, then no correction is executed for a referenced axis. If the difference between the reference point coordinate and detected actual position is greater than the inner window and less than the outer window (p2602), then a correction is executed for a referenced axis.		
p2602	EPOS flying referencing outer window / Outer window		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3614 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the outer window for flying referencing. Value = 0: The evaluation of the outer window is de-activated.		
Dependency:	Refer to: p2597, r2684		
Notice:	The inner window must be set so that it is smaller than the outer window.		
Note:	If the difference between the reference point coordinate and detected actual position is greater than the outer window, then no correction is executed for the referenced axis. Further, an appropriate message is output and r2684.3 is set to 1.		
p2603	EPOS flying referencing, positioning mode relative / Pos_mode relative		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the relative positioning mode for flying referencing. Value = 1: The corrected setpoint is not calculated into the traversing distance. Value = 0: The corrected setpoint is calculated into the traversing distance.		
Dependency:	Refer to: p2597, p2623, p2648		
Notice:	For p2603 = 0 the direction can change.

Description:	Sets the signal sources for the start direction of the search for reference. 1 signal: Start in the negative direction. 0 signal: Start in the positive direction.		
Dependency:	Refer to: p2583, p2595, p2597		
p2605	EPOS search for reference approach velocity reference cam / v_appr ref_cam		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/min]	40000000 [1000 LU/min]	5000 [1000 LU/min]
Description:	Sets the approach velocity to the reference cam for the search for reference.		
Dependency:	The search for reference only starts with the approach velocity to the reference cam when there is a reference cam (p2607 = 1). Refer to: p2595, p2597, p2604, p2606, p2607		
Note:	When traversing to the reference cam, the velocity override is effective. If, at the start of the search for reference, the axis is already at the reference cam, then the axis immediately starts to traverse to the zero mark.		
p2606	EPOS search for reference reference cam maximum distance / Ref_cam max s		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1

	Min	Max	Factory setting
	0 [LU]	2147482647 [LU]	2147482647 [LU]
Description:	Sets the maximum distance after the start of the search for reference when traversing to the reference cam.		
Dependency:	Refer to: p2595, p2597, p2604, p2605, p2607		
Note:	When using a reversing cam, the maximum distance must be set appropriately long.		
p2607	EPOS search for reference reference cam present / Ref_cam pres		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Units group: -	Unit selection: -

	Min	Max	Factory setting
	0	1	1
Description:	Sets whether or not a reference cam is present for the search for reference. Value = 1: Reference cam present. Value = 0: No reference cam present.		
Dependency:	Refer to: p2595, p2597, p2604, p2605, p2606		

p2608	EPOS search for reference approach velocity zero mark / v_appr ref_ZM		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 1 [1000 LU/min]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 40000000 [1000 LU/min]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 300 [1000 LU/min]
Description:	Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference.		
Dependency:	If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark. Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
Caution:	If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained. After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks.		
			
Note:	The velocity override is not effective when traversing to the zero mark.		
p2609	EPOS search for reference max distance ref cam and zero mark / Max s ref_cam ZM		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 20000 [LU]
Description:	Sets the maximum distance after leaving the reference cam when traversing to the zero mark.		
Dependency:	Refer to: p2595, p2597, p2604, p2607, p2608, p2610		
p2610	EPOS search for ref. tol. bandwidth for distance to zero mark / Tol_band to ZM		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 2147482647 [LU]
Description:	Sets the tolerance bandwidth for the distance to the zero mark The zero mark is evaluated within the maximum distance between the reference cam and zero mark (p2609) minus the tolerance bandwidth for the distance to the zero mark (p2610).		
Dependency:	Refer to: p2609		
p2611	EPOS search for reference approach velocity reference point / v_appr ref_pt		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 1 [1000 LU/min]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 40000000 [1000 LU/min]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 300 [1000 LU/min]
Description:	Sets the approach velocity after detecting the zero mark to approach the reference point.		
Dependency:	Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
Note:	When traversing to the reference point, the velocity override is not effective.

Description: Sets the signal source for the reversing cam in the negative direction of travel.
1 signal: Reversing cam not reached.

0 signal: Reversing cam reached.

Dependency: Refer to: p2613

Note: If, during the search for reference from the reversing cam minus and plus, a 0 signal is detected, then the axis remains stationary (at standstill).

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for "activating traversing task". BI: p2631 = 0/1 signal The traversing task, selected using BI: p2625 ... p2630, is started.		
Dependency:	Refer to: p2625, p2626, p2627, p2628, p2629, p2630, p2640, p2641		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	To start a traversing block, the axis must be referenced (r2684.11 = 1). The status signal r2684.12 = 0/1 signal is used for acknowledgement. A traversing task can be influenced using the following signals: - intermediate stop via BI: p2640. - reject traversing task via BI: p2641.		

p2632	EPOS external block change evaluation / Ext BickChg eval		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

	Min	Max	Factory setting
	0	1	0
Description:	Sets the mode to evaluate "external block change".		
Value:	0: External block change via the measuring probe 1: External block change via BI: p2633		
Dependency:	Refer to: p2623, p2633, r2677, r2678		
Note:	In the mode "external block change via measuring probe (p2632 = 0), the following applies: When starting a traversing block with the block change enable CONTINUE_EXTERNAL, CONTINUE_EXTERNAL_WAIT and CONTINUE_EXTERNAL_ALARM an activated "flying referencing" is interrupted. After ending the block, "flying referencing" must be re-activated via BI: p2595 = 0/1 signal.

p2633	BI: EPOS external block change (0 -> 1) / Ext BlckChg (0->1)		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 1 Func. diagram: 3615 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for "external block change". BI: p2633 = 0/1 signal		
Dependency:	The evaluation of the signal is only active p2632 = 1. Refer to: p2623, p2632, p2640, p2641, r2677, r2678		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	A 0/1 edge initiates a flying block change in the subsequent traversing block. When the external block change is identified, the actual position is saved in r2678. A traversing task can be influenced using the following signals: - intermediate stop via BI: p2640. - reject traversing task via BI: p2641.		
<hr/>			
p2634[0...n]	EPOS fixed stop maximum following error / Following err max		
SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed loop position control Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3617, 4025 Unit selection: - Expert list: 1 Factory setting 1000 [LU]
Description:	Sets the following error to detect the "fixed stop reached" state (r2526.4).		
Dependency:	Refer to: r2526, p2621, r2675		
Note:	The state "fixed stop reached" is detected if the following error exceeds the theoretically calculated following error value by p2634.		
<hr/>			
p2635	EPOS fixed stop monitoring window / Fixed stop monit		
SERVO (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed loop position control Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3617, 4025 Unit selection: - Expert list: 1 Factory setting 100 [LU]
Description:	Sets the monitoring window of the actual position after the fixed stop is reached.		
Dependency:	Refer to: r2526, r2683		
Note:	If, after the fixed stop is reached, the end stop shifts in either the positive or negative direction by more than the value set here, then BO: r2526.5 is set to 1 and an appropriate message is output.		

p2637	BI: EPOS fixed stop reached / Fixed stop reached		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

	-	-	2526.4
Description:	Sets the signal source for the feedback signal "fixed stop reached". BI: p2637 = 1 signal Fixed stop is reached. BI: p2637 = 0 signal Fixed stop is not reached.		
Dependency:	Refer to: r2526, p2634		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The identification of "fixed stop reached" is, for the factory setting, dependent on the signal BO: r2526.4 (fixed stop reached). This signal is influenced via p2634 (EPOS fixed stop, maximum following error).		
p2638	BI: EPOS fixed stop outside the monitoring window / Fixed stop outside		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.5
Description:	Sets the signal source for the feedback signal "fixed stop outside the monitoring window". BI: p2638 = 1 signal Fixed stop is located outside the monitoring window. BI: p2638 = 0 signal Fixed stop is inside the monitoring window.		
Dependency:	Refer to: r2526, p2635		
Note:	The identification of "fixed stop outside the monitoring window" is, for the factory setting, dependent on signal BO: r2526.5 (fixed stop outside window). This signal is influenced via p2635 (EPOS fixed stop monitoring window).		
p2639	BI: EPOS force limit reached / F_limit reached		
SERVO (EPOS, Lin), SERVO_AC (EPOS, Lin)	Can be changed: T	Calculated: -	Access level: 3

	Min	Max	Factory setting
	-	-	1407.7
Description:	Sets the signal source for the feedback signal "force limit reached" when traversing to fixed stop. BI: p2639 = 1 signal Force limit has been reached. BI: p2639 = 0 signal Force limit has not been reached.		
Dependency:	Refer to: r1407		
Note:	The feedback signal from "force limit reached" is, for the factory setting, dependent on the signal BO: r1407.7 (torque limit reached).		

p2639	BI: EPOS torque limit reached / M_limit reached		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3

Description:	Sets the signal source for the "no intermediate stop/intermediate stop". BI: p2640 = 1 signal No intermediate stop. BI: p2640 = 0 signal Intermediate stop.		
Dependency:	Refer to: p2631, p2641, p2647, p2649		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI". When activating the intermediate stop, the axis brakes with the parameterized deceleration (p2620 or p2645).		

p2641	BI: EPOS reject traversing task (0 signal) / Trav_task reject		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

Description:	Sets the signal source for "do not reject traversing task/reject traversing task". BI: p2641 = 1 signal Do not reject traversing task. BI: p2641 = 0 signal Reject traversing task.		
Dependency:	Refer to: p2631, p2640, p2647, p2649		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note: This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI".
 When activating reject traversing tasks, then the axis brakes with the maximum deceleration (p2573).

Description: Sets the signal source for the position setpoint in the mode "direct setpoint input/MDI".
Dependency: Refer to: p2648, p2649, p2650, p2690
Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note: Depending on p2649, the position setpoint is either transferred continuously or edge-triggered.
 The position setpoint input is interpreted as length unit [LU].

Dependency: Refer to: p2649, p2650, p2693

2 Parameters

2.2 List of parameters

Notice: If, when calculating the traversing profile, it is identified that the target position with the programmed deceleration override cannot be reached without reversing the direction, then when accepting the dynamic values, the larger deceleration override is accepted and becomes effective.

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: Depending on p2649, the deceleration override is either transferred continuously or edge-triggered.
The signal value 4000 hex (16384 dec) corresponds to 100 %.

p2646	CI: EPOS velocity override / v_{over}		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max -	Access level: 1 Func. diagram: 3630 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the velocity override. This velocity override is effective in the following operating modes "direct setpoint input/MDI", "traversing blocks", "jogging" and "search for reference" (when approaching the reference cam).		
Dependency:	Refer to: p2571, p2585, p2586, p2605, p2618, p2643, r2681		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The effective override (r2681) can differ from the specified override due to limits (e.g. maximum velocity).		

p2647	BI: EPOS direct setpoint input/MDI selection / MDI selection		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 1 Func. diagram: 3620, 3625, 3640 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for selecting the operating mode "direct setpoint input/MDI".		
Dependency:	Refer to: p2640, p2641, p2642, p2643, p2644, p2645, p2646, p2648, p2649, p2650, p2651, p2652, p2653		
Note:	In this mode, using BI: p2653 it is possible to make a flying changeover between setting-up and positioning. In this mode, even if the axis is not referenced (r2684.11 = 0) relative positioning is possible.		

p2648	BI: EPOS direct setpoint input/MDI positioning type / MDI pos_{type}		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 1 Func. diagram: 3620 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the positioning type in the mode "direct setpoint input/MDI". BI: p2648 = 1 signal Absolute positioning is selected. BI: p2648 = 0 signal Relative positioning is selected.		
Dependency:	Refer to: p2649, p2650, p2654		
Notice:	Absolute positioning: To traverse, the reference point must be set (r2684.11 = 1). Relative positioning: To traverse, it is not necessary that the reference point is set.		
Note:	Depending on p2649, the positioning type is either transferred continuously or edge-triggered. Binector input p2648 is only evaluated when connector input p2654 = 0. If p2654 is a value other than 0, the positioning type is evaluated by means of the set signal source.		

p2649	BI: EPOS direct setpoint input/MDI transfer type selection / MDI trans_type sel		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to define how values are transferred in the operating mode "direct setpoint input/MDI". BI: p2649 = 1 signal Values are continually transferred (refer to parameter under dependency). BI: p2649 = 0 signal The values are transferred for BI: p2650 = 0/1 signal.		
Dependency:	Refer to: p2642, p2643, p2644, p2645, p2648, p2650, p2651, p2652		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			
Note:	Parameter p2649 can only be changed when p0922 (p2079) = 999.		
p2650	BI: EPOS direct setpoint input/MDI setpoint acceptance edge / MDI setp_accept

	P-Group: Basic positioner	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to accept the values for edge-triggered selection (BI: p2649 = 0 signal) in the operating mode "direct setpoint input/MDI". BI: p2650 = 0/1 signal and BI: p2649 = 0 signal Values are accepted, edge-triggered (refer to parameter under dependency).		
Dependency:	Refer to: p2640, p2641, p2642, p2643, p2644, p2645, p2648, p2649, p2651, p2652, r2684		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The status signal r2684.12 = 0/1 signal is used for acknowledgement. The operating mode "direct setpoint input/MDI" can be influenced via the following signals: - intermediate stop via BI: p2640. - reject traversing task via BI: p2641.		
p2651	BI: EPOS direct setpoint input/MDI direction selection, positive / MDI dir_sel pos		
SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

Description:	Sets the signal source for the positive direction selection in the operating mode "direct setpoint input/MDI".		
Dependency:	Refer to: p2576, p2648, p2649, p2650, p2652, p2653, p2654		

2 Parameters

2.2 List of parameters

Note: The following applies for "setting-up":

- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are de-selected, then the axis remains stationary (zero speed).

The following applies for "positioning":

Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:

BI: p2651 / BI: p2652

0 signal / 0 signal: Absolute positioning through the shortest distance.
 1 signal / 0 signal: Absolute positioning in the positive direction.
 0 signal / 1 signal: Absolute positioning in the negative direction.
 1 signal / 1 signal: Absolute positioning through the shortest distance.

p2652 BI: EPOS direct setpoint input/MDI direction selection negative / MDI dir_sel neg

SERVO (EPOS), SERVO_AC (EPOS), VECTOR (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1

Description: Sets the signal source for the negative direction selection in the operating mode "direct setpoint input/MDI".

Dependency: Refer to: p2576, p2648, p2649, p2650, p2651, p2653, p2654

Note: The following applies for "setting-up":

- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are de-selected, then the axis remains stationary (zero speed).

The following applies for "positioning":

Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:

BI: p2651 / BI: p2652

0 signal / 0 signal: Absolute positioning through the shortest distance.
 1 signal / 0 signal: Absolute positioning in the positive direction.
 0 signal / 1 signal: Absolute positioning in the negative direction.
 1 signal / 1 signal: Absolute positioning through the shortest distance.

Description: Sets the signal source for setting-up in the operating mode "direct setpoint input/MDI".

BI: p2653 = 1 signal

Setting-up selected.

BI: p2653 = 0 signal

Positioning selected.

Dependency: Refer to: p2651, p2652

Note: In the operating mode "direct setpoint input/MDI", it is possible to make a flying changeover between setting-up and positioning.

For "setup" (BI: p2653 = 1 signal), the following applies:

A traversing direction must be selected via binector inputs p2651 and p2652.

Description: Connector output of the reference quantity for currents p2002.
All currents specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
This parameter has the unit Arms.

Dependency: Refer to: p2002

Note: This BICO parameter provides the numerical value of the reference quantity p2002 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

Description: Displays the actual reference quantity for forces.
All forces specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

Dependency: p0505, r0108.12
Refer to: p2003

Note: This BICO parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC). It is not suitable for interconnecting for cyclic communication.
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
Example:
The actual value of the total force (r0079[0]) is connected to a test socket (e.g. p0771[0]). The actual force is cyclically converted into a percentage of the reference force (p2003) and output according to the parameterized scaling.

Description: Connector output of the reference quantity for accelerations p2007.
All acceleration rates specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
The unit of this parameter is the same as the unit selected for p2007.

Dependency: r0108.12, p0505
Refer to: p2007

Note: This BICO parameter provides the numerical value of the reference quantity p2007 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value in the currently selected unit can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

	00	Load gear activate position tracking	Yes	No	-
	01	Axis type	Linear axis	Rotary axis	-
	02	Load gear reset position	Yes	No	-

Note: For the following events, the non-volatile, saved position values are automatically reset:
- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).
- when adjusting the absolute encoder again

p2721[0...n]**Load gear rotary absolute encoder revolutions virtual / Abs rot rev**

HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(1, 4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 4194303	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
---	---	--	---

Description: Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.

Dependency: This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).

2 Parameters

2.2 List of parameters

Note: The resolution that is set must be able to be represented using r2723.
 For rotary axes/modulo axes, the following applies:
 This parameter is pre-set with p0421 when activating position tracking and can be changed.
 For linear axes, the following applies:
 This parameter is pre-assigned with p0421 when activating position tracking, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.

p2722[0...n]	Load gear position tracking tolerance window / Pos track tol		
HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(1, 4) Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 4294967300.00	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00
Description:	Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output. Rotation, e.g. through a complete encoder range is not detected.		
Caution: 	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

Description:	Displays the position difference before the load gear between powering down and powering up.		
Note:	The increments are displayed in the same format as for r0483/r2723. If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments. If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor.

Description:	Sets the configuration for the elasticity-based pole position identification. Depending on the mechanical design (sequence machine - encoder - brake) and the braking force, the pole position identification can cause deflections with a different control sense. Re bit 00 = 0: The deflection caused by the pole position identification acts in the positive control sense. Re bit 00 = 1: The deflection caused by the pole position identification acts in the negative control sense. This can only occur for a linear measuring system if a brake is installed between the machine and the measuring system and the brake is powerful enough to do this.

Description: Sets the mode for the time stamp
 p3100 = 0: Time stamp, operating hours
 p3100 = 1: Time stamp, UTC format
 p3100 = 2: Time stamp, operating hours + 01.01.2000

Notice: The realtime format (p3100 = 1), once selected, remains until the next time that the system is switched off. Switching back to operating hours (p3100 = 0) or operating hours + 01.01.2000 (p3100=2) is prevented.

Note: RTC: Real-time clock
 UTC: Universal Time Coordinates
 The UTC time started, according to the definition on 01.01.1970 at 00:00:00 and is output in days and milliseconds.

Note: Re bit 00:

Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact the hotline.

Re bit 01:

A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

Re bit 02:

The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

2 Parameters

2.2 List of parameters

Re bit 03:

An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

Re bit 04:

The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

Re bit 05:

A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cable (connection). Check the motor.

Re bit 06:

The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

Re bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

Re bit 08:

A safety operation monitoring function (Safety) has detected an error.

Re bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

Re bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

Re bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

Re bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

Description: Sets the signal source for the automatic acknowledgement on the device drive object.
BI: p3116 = 0 signal
Faults present are automatically acknowledged on the device drive object. Local device faults are forwarded to the first active drive object.
BI: p3116 = 1 signal
Faults present are not automatically acknowledged on the device drive object. Local device faults are not forwarded.

Dependency: Refer to: p2102, p2103, p2104, p2105, p3981

p3238[0...n]	OFF delay n_act_motor model = n_act external / t_del n_a = n_ext				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012		
	P-Group: Messages	Units group: -	Unit selection: -		
	Not for motor type: REL	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	0.0 [s]	100.0 [s]	3.0 [s]		
Description:	Sets the OFF delay for the signal "speed deviation model/external in tolerance" (BO: r2199.7). The smoothed actual speed of the motor model r2169 is compared with the speed measured externally r1443 (threshold value p3236).				
Dependency:	Refer to: p3236, p3237				
p3290	Variable signaling function start / Var sig start				
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 5301		
	P-Group: -	Units group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0010 bin		
Description:	Settings for start/stop and the comparison type for the variable signaling function.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activate function	Active	Not active	-
	01	Comparison with sign	With sign	Without sign	-
Dependency:	Refer to: p3291, p3292, p3293, r3294, p3295, p3296, p3297, p3298, p3299				
Notice:	The parameters of the variable message function are only checked and become effective when starting. Otherwise, an alarm is output.				
p3291	CI: Variable signaling function signal source / Var sig S_src				
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned32 / Integer16	Dyn. index: -	Func. diagram: 5301		
	P-Group: -	Units group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0		
Description:	Sets the signal source for the variable signaling function.				
Dependency:	Refer to: p3290, p3292, p3293				
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.				
Note:	Re p3291 = 1: (internal Siemens): In this case, the signal source is defined via the memory address (p3292) and the data type (p3293). As the memory address can be different for each version, it must always be redetermined. Procedure: - Set the memory address and data type (p3292, p3293). - Establish the BICO interconnection (p3291 = 1).				

p3292	Variable signaling function signal source address / Var sig S_src addr		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 5301

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0000 hex	FFFF FFFF hex	0000 hex
Description:	Sets the address of the signal source for the variable signaling function.		
Dependency:	Refer to: p3290, p3291		
Caution:	If an incorrect address and data type are set, then this can cause the software to crash.		
			
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		
Note:	This parameter should only be set for p3291 = 1.		
p3293	Variable signaling function signal source data type / Var sig S_src type		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Integer16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

Description:	Sets the data type of the signal source for the variable signaling function.		
Value:	0: Unknown 1: U8, Unsigned8 2: I8, Signed8 3: U16, Unsigned16 4: I16, Signed16 5: U32, Unsigned32 6: I32, Signed32 7: Float, FloatingPoint32		
Dependency:	Refer to: p3290, p3291		
Caution:	If an incorrect address and data type are set, then this can cause the software to crash.		
			
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		
Note:	This parameter should only be set for p3291 = 1.		
r3294	BO: Variable signaling function output signal / Var sig outp_sig		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 5301

	-340.28235E36	340.28235E36	0.000
Description:	Sets the threshold value for the variable signaling function.		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		

p3296	Variable signaling function hysteresis / Var sig hyst		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	340.28235E36	0.000
Description:	Sets the hysteresis for the variable signaling function.		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		

p3297	Variable signaling function pickup delay / Var sig t_pickup		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	0 [ms]
Description:	Sets the pickup delay for the variable signaling function.		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. Values that do not comply with the following condition are rejected: Pickup delay (p3297) >= sampling time (p3299)		
Note:	For a value of 0, the pickup delay is disabled. The output signal is set if the condition for the 1 signal is fulfilled for longer than the selected time.		

p3298	Variable signaling function dropout delay / Var sig t_dropout		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	0 [ms]
Description:	Sets the dropout delay for the variable signaling function.		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. Values that do not comply with the following condition are rejected: Dropout delay (p3298) >= sampling time (p3299)		
Note:	For a value of 0, the dropout delay is disabled. The output signal is reset if the condition for the 0 signal is fulfilled for longer than the selected time.		

p3299	Variable signaling function sampling time / Var sig t_sample		
HLA, SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.000 [ms]	4.000 [ms]	4.000 [ms]
Description:	Sets the sampling time for the variable signaling function.		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. The following must apply for the setting: Sampling time (p3299) <= pickup delay (p3297), dropout delay (p3298)		
Note:	Only the following values can be set: 1.000, 2.000, 3.000, 4.000		

p3320[0...n]	Fluid flow machine power point 1 / Fluid_mach P1

p3400	Infeed configuration word / INF config_word				
A_INF, R_INF, S_INF	Can be changed: T Data type: Unsigned16 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 2 Func. diagram: 8940 Unit selection: - Expert list: 1 Factory setting 0000 1010 bin		
Description:	Sets the configuration word of the infeed.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Smart Mode	ON	OFF	-
	01	Flat-Top Mode	ON	OFF	-
	03	Vdc controller	ON	OFF	-
	05	Line supply voltage sensing with VSM	ON	OFF	-
Dependency:	Refer to: p0210				
Note:	<p>Re bit 00: In the Smart Mode, the DC link voltage is not controlled - however, infeed can still regenerate. The magnitude of the DC link voltage depends on the actual line supply voltage and the DC link load. For drive units belonging to the 400 V voltage class, for a drive unit supply voltage (p0210) greater than 415 V, the Smart Mode is activated. This means that the 660 V limit can be maintained for the steady-state DC link voltage (p0280) up to a line supply voltage of 480 V.</p> <p>Re bit 01: If the Flat Top Mode is de-activated, switching losses are higher. This means that the full power is no longer continuously available. For p3400.0 = 1 or p1810.15 =1, this bit is not effective.</p> <p>Re bit 03: If the Vdc controller is switched out, overvoltage or undervoltage conditions occur in the DC link if no other voltage-regulating component is located in the DC link. For p3400.0 = 1, this bit is not effective.</p> <p>Re bit 05: If a VSM is detected when commissioning the system, this bit is automatically set. When the bit is set, the line supply voltage input of the VSM must be connected (connected at the line side of the line reactor). The bit must be set in the case of chassis power units. VSM: Voltage Sensing Module</p>

2 Parameters

2.2 List of parameters

Note:

Re bit 00:
Smart Mode is activated with p3400.0.

Re bit 01:
The DC link voltage closed-loop control is activated with parameters p3400.3 and p3513.

Re bit 02:
When phase failure is detected the bit is set and alarm A06205 is output.
The bit is reset for the following events:
- the infeed had reached the normal operating state again after a phase failure has been bypassed/buffered (p3402 = 9).
- the pulse enable is withdrawn due to a fault or powering down with OFF1/OFF2.

Re bit 03:
The present current limit is displayed in r0067.

Re bit 04:
An active current setting r0078 >= 0 means infeed operation in motor mode; an active current setting r0078 < 0 means regenerative operation in generator mode.

Re bit 05:
The motor mode inhibit is activated with p3532.

Re bit 06:
The generator mode inhibit is activated with p3533.

Re bit 07:
The alarm threshold is dependent on r0296 and the setting in p0279.

Description:	Sets the mode to detect the line supply frequency.			
Value:	0: Line supply frequency setting 50/60 Hz off 1: Line supply frequency setting 50/60 Hz on			
Dependency:	Refer to: p0211, p0284, p0285			
Note:	For p3409 = 1, the following applies: After operation has been enabled, the rated line supply frequency (p0211) is automatically set to a value of 50 Hz or 60 Hz corresponding to the currently measured frequency. This means that the parameter value of p0211 is, under certain circumstances, changed. For p3409 = 0, the following applies: The system does not change parameter p0211.

Description:	Sets the line and DC link parameter identification routine for the infeed module.			
Value:	0: Identification (Id) off 1: Activate identification (Id) 2: Set controller settings 3: Save identification and controller settings 4: Save identification and controller settings with L adaptation 5: Reset save Id and controller setting with L adaptation			
Dependency:	Refer to: r3411, r3412, r3414, p3415, p3416, p3417, p3421, p3422, p3424, p3555, p3560, p3614			
Notice:	For p3410 = 1, 3, 4, 5, alarm A06400 is output and designates that the selected identification will take place the next time that the pulses are enabled. The line and DC link adaptation is not permissible for Smart Line Modules in the chassis format.			
Note:	p3410 is automatically set to 0 after an identification run has been completed. When p3410 = 1 an identification run for the total inductance and DC link capacitance is initiated when the pulses are next enabled. The results are displayed in r3411 and r3412. If a Voltage Sensing Module (VSM) is connected, then the line inductance (r3414) is also measured. The infeed then goes into the ready for switching on state. For p3410 = 2, the data (r3411, r3412 and r3414) determined during the identification run (p3410 = 1) are transferred into p3421, p3422 and p3424. The control loop parameters are suitably scaled to achieve a rugged controller setting (p3425); the fast controller response (p3555[2]) and the current actual value smoothing (p3614) are pre-set. Calculations for the controller are then repeated. The user must save the data in a non-volatile fashion so that the new controller setting is effective the next time that the system is switched on. When p3410 = 3 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters. When p3410 = 4 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. The line inductance identification is then repeated, if p3415[1] > p3514[0]. If the inductance measured the second time is lower than the first, the parameters are written to the current controller adaptation (p3620, p3622). All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters.			

2 Parameters

2.2 List of parameters

For p3410 = 5, the same measurements and write operations are always carried out as for p3410 = 4. However, for the first identification run, initially the controller setting is reset by setting p3421 = p0223 + p0225, p3424 = p0225, p3422 = p0227 and p3425[0...1] = 100 %. Further, before the measurements are carried out, a brief identification run is executed to coarsely set the controller.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified total inductance. The value corresponds to the total inductance between the rigid line supply and the infeed input terminals.		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		
Note:	The value measured in the first identification run is displayed in r3411[0] (for p3410 = 1, 3, 4, 5). This value is transferred to p3421. The value measured in the second identification run (for p3410 = 4, 5) is displayed in r3411[1] - this value is used to set the current controller adaptation (p3622). For the inductance of the commutating reactor, the following applies. r3411 - r3414		

r3412[0...1]	Infeed DC link capacitance identified / INF C_DClink ident		
A_INF, R_INF, S_INF	Can be changed: -	Calculated: -	Access level: 2

	Min	Max	Factory setting
	- [mF]	- [mF]	- [mF]
Description:	Displays the identified total DC link capacitance.		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		
Note:	The value measured in the first identification run (for p3410 = 1, 3, 4, 5) is displayed in r3412[0]. For p3410 = 1, 3, this value is transferred to p3422. The DC link capacitance is not measured at the second identification run. The total DC link capacitance of a DC link group comprises the sum of the sub-capacitances of all motor/infeed modules and the additional DC link capacitors.		

r3414[0...1]	Infeed line supply inductance identified / INF t_line ident		
A_INF, R_INF, S_INF	Can be changed: -	Calculated: -	Access level: 2

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified line supply inductance. The value corresponds to the total inductance between the stiff line supply and the connection point of the Voltage Sensing Module (VSM).		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		

- Notice:** The value is only automatically determined for the line supply identification ($p3410 > 0$), if operation with a Voltage Sensing Module is selected ($p3400.5 = 1$). Otherwise, $r3414 = 0$ is displayed.
- Note:** The value measured in the first identification run is displayed in $r3414[0]$ (for $p3410 = 1, 3, 4, 5$). This value is transferred to $p3421$.
The value measured in the second identification run is displayed in $r3414[1]$ (for $p3410 = 4, 5$).
For the inductance of the commutating reactor, the following applies.
 $r3411 - r3414$

p3415[0...1] Infeed excitation current L identification / INF I_exc L_Ident

A_INF, R_INF, S_INF	Can be changed: T	Calculated: -	Access level: 4

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.00 [%]	75.00 [%]	20.00 [%]

Description: Sets the magnitude of the excitation frequency for the L identification.
The setting is made as a percentage of the maximum power unit current ($r0209$).

Index: [0] = Run 1
[1] = Run 2

Dependency: Refer to: $p3410, r3411, p3421, p3620, p3622$

Notice: To correctly identify the current level ($p3410 = 4, 5$) depending on the reactor inductance, the following must apply:
 $p3415[0] < p3415[1]$

For A_INF booksized units, the following applies:

The interrelationship between the reactor inductance and the current magnitude should be measured. Generally, the factory setting of $p3415[0]$ and $p3415[1]$ should be kept.

For chassis units and S_INF booksized units, the following applies:

Generally, there is only a very low inter-relationship between the reactor inductance and the current magnitude. This means that for the factory setting $p3415[0] = p3415[1] = 20\%$, i.e. run 2 is not executed.

Note: The reactive current for identification run 1 is set in $p3415[0]$ (basic controller setting).

The reactive current for identification run 2 is set in $p3415[1]$ (adaptation of the current controller when reducing the reactor inductance with increasing current magnitude).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001 [mH]	2000.000 [mH]	1.000 [mH]
Description:	Sets the total effective inductance for the closed-loop current control from the sum of the line supply inductance and inductance of the line reactor. This parameter is pre-set to the sum of p0223 and p0225.		
Dependency:	Refer to: p0223, p0225, p3410, p3425, p3614, p3622		
Note:	The controller setting is derived from this value and p3425. The value can be automatically determined using the identification run (p3410). For a parallel circuit, the value corresponds to the inductance of a power unit. For the inductance value of the line reactor, p3421 - p3424 applies.

	0.20 [mF]	2000.00 [mF]	2.00 [mF]
Description:	Sets the DC link capacitance for the closed-loop voltage control. This value is pre-set with p0227.		
Dependency:	Refer to: p0227, p3410, p3425		
Note:	The controller setting is derived from this value and p3425. A suitable value can be automatically determined using the identification run (p3410).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [mF]	2000.00 [mF]	2.00 [mF]
Description:	Sets the total DC link capacitance for closed-loop voltage control. The capacitance of one power unit is pre-assigned to this value. The value should be adapted according to the number of power units.		
Note:	The controller setting for the DC-link voltage controller is derived from this value.		
p3424	Infeed line supply inductance / INF L_line		
A_INF, R_INF, S_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001 [mH]	1000.000 [mH]	0.001 [mH]
Description:	Sets the line supply inductance. This parameter is pre-set with p0225.		
Dependency:	Refer to: p0223, p0225, p3410, p3425, p3622		

Note: The controller setting is derived from this value and p3425.
The value can be automatically determined using the identification (p3410) if operation with a Voltage Sensing Module is selected. Otherwise, p3424 is set to p3421 - p0223.

p3425[0...1] Infeed control loop parameter scaling / INF par scal			
A_INF, R_INF, S_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.00 [%]	1000.00 [%]	100.00 [%]
Description:	Sets the scaling factors for controller parameters p3421, p3422 and p3424.		
Index:	[0] = Scaling inductance [1] = Scaling capacitance		
Dependency:	Refer to: p3410, p3421, p3422, p3424, p3614		
Note:	p3425 is automatically set to the optimum value when setting the control parameters using the line supply data identification p3410 >= 2. As the line supply inductance (p3424) increases in comparison to the total inductance (p3421), lower values must be selected for p3425. This means that the control is adapted to weak line supplies with high relative short-circuit voltage uk or high line supply inductance (also refer to p3614). The scaled control loop parameters become effective for closed-loop control, i.e. the products p3421 * p3425[0] and p3422 * p3425[1] represent the controller setting.		

p3440 Smart Mode configuration / Smart Mode config					
A_INF, R_INF, S_INF	Can be changed: T	Calculated: -	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Closed-loop control	Units group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0001 bin		
Description:	Sets the configuration of the Smart Mode.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Soft Pulse Mode	ON	OFF	-
	01	Extended Smart Mode	ON	OFF	-
	02	De-select automatic line identification after POWER ON	Yes	No	-
Notice:	Re bit 00: This parameter influences the line harmonics for regenerative operation. For operation with switched frequency line filter (AIM) the soft-pulse mode must be activated.				
Note:	Re bit 00: When the pulsed mode for Smart Mode is de-activated, when regenerating, higher phase current gradients occur. For Smart Line Modules in the "chassis" format, pulsed operation is not effective. Re bit 01: The Extended Smart Mode can only be activated for booksize power units. For active Extended Smart Mode, for partial load operation, the line reactive power requirement must be reduced and the average value of the DC link voltage increased. At rated load and overload, the operating behavior is equivalent to the normal Smart mode. Re bit 02: When automatic line identification is selected, the inductance and DC-link capacitance values are calculated on the first pulse enable after each POWER ON and saved in p3448[0...1]. In the case of manual input of p3448[0...1], automatic line identification must be de-selected. The control loop parameters are required for the Extended Smart Mode.

Description:	Sets the current threshold values for the de-activation (index 0) and activation (index 1) of line commutation in Smart Mode.		
Index:	[0] = De-activating [1] = Activating		
Note:	A value of 100% corresponds to the minimum feedback load current derived from the loop control parameters (p0210, p0211, p3409, p3448[0], p3432) without infeed components. To avoid frequent changeovers in operation close to the changeover point, the value for activation (index 1) must be significantly higher than the value for de-activation (index 0).

Description:	Sets the effective inductance or DC-link capacitance in Smart Mode.		
Index:	[0] = Effective inductance referred to p0223 [1] = Effective DC link capacitance referred to p0227		
Notice:	p3448[0] is used in the calculation of the reference value of p3443 and in the controller models. p3448[1] is used in the calculation of the reference value of p3441 and in the controller models. When automatic line identification is selected (p3440.2 = 0), the following applies: - the inductance and DC-link capacitance values are calculated on the first pulse enable after each POWER ON and saved in p3448[0...1]. - values entered manually are overwritten after the next POWER ON. When automatic line identification is de-selected (p3440.2 = 1), the following applies: - the inductance and DC-link capacitance values must be entered manually.		
Note:	Re index 0: A value of 100% corresponds to the inductance parameterized in p0223. For a parallel circuit, the value corresponds to the inductance of a power unit. Re index 1: A value of 100% corresponds to the capacitance parameterized in p0227. The value includes the capacitances of all modules connected on the DC link.

	Min	Max	Factory setting
	0.00 [s]	10000.00 [s]	0.00 [s]

Description: Sets the maximum permissible wait time for the line supply to return after identifying a line fault.

Note: This parameter is used to define how long alarm A06205 may be continuously present. F06200 is initiated after the wait time has expired.

For p3462 = 0, the following applies:

The time monitoring is de-activated. Fault F06200 is only output, if in addition to A06205, an additional message is initiated with a stop response.

Description:	Display and connector output for the line supply voltage at the input terminals of the line filter in alpha/beta components.		
Index:	[0] = Alpha [1] = Beta [2] = Alpha [3] = Beta [4] = Alpha [5] = Beta		
Note:	Re Index 0, 1: The input terminals of the line filter form, for infeeds, the connection point of the Voltage Sensing Module (VSM) to measure the line supply voltage. For operation with VSM (p3400.5 = 1), the following applies: The voltage measured values r3661 and r3662, transformed into the alpha/beta system are displayed in r3468. For encoderless operation without VSM (p3400.5 = 0), the following applies: The estimated values of the voltages from the line supply model of the PLL transformed into the alpha/beta system are displayed in r3468.		

Re Index 2, 3:

The basic fundamental amplitudes of the clocked inverter output voltages are displayed.

The values are only valid when operation is enabled.

Re Index 4, 5:

The basic fundamental amplitudes of the voltage source calculated using a line model are displayed.

The values are only valid when operation is enabled.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the active current requirement due to the line filter.		
Dependency:	Refer to: r0038, p0221, p0222		
Note:	With respect to the line supply, the sum of the active currents of the power unit (p0078) and line filter (r3470) are effective. The active current demand of the line filter is taken into account when calculating the power factor (r0038). The magnitude of the line filter active current depends on the capacitance (p0221) and the resistance (p0222) of the line filter.		
r3471	Infeed reactive current filter / INF I_{reactive}Filt

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the reactive current requirement as a result of the line filter. The reactive current requirement of a line filter is covered by the controlled infeed/regenerative feedback so that the converter always operates with a power factor of 1 compared to the line.		
Dependency:	Refer to: r0038, r0075, r0076, p0221		
Note:	With respect to the line supply, the sum of the reactive currents of the power unit (p0076) and line filter (r3471) are effective. The reactive current requirement of the line filter is taken into account when calculating the power factor (r0038). The amount of the reactive current depends on the capacitance (p0221) of the line filter that is automatically parameterized when a line filter is selected (p0220). If the line phases are reversed and the line voltage therefore has a negative orientation (r0066 < 0), it should be noted that the sign of the reactive current is reversed.

2 Parameters

2.2 List of parameters

Re bit 02:

When the bit is activated, the phase sequence of the signal source, interconnected via connector inputs p3473 and p3474, is negated with respect to the signals at the inputs of the infeed. For example, this is the case for a transformer with a phase rotation of 180 ° and the corresponding tapping of the signals.

For p3475.2 = 0, the following applies:

The phase sequence of the signal source in p3473 and p3474 is not negated.

For p3475.2 = 1, the following applies:

The phase sequence of the signal source in p3473 and p3474 is negated.

Description:	Display and connector output for the sign of the offset factor (cos phi). The offset factor cos phi is defined as the cosine of the phase angle between the sinusoidal oscillations of the voltage and the current of the fundamental frequency.		
Note:	The following definition of the signs corresponds with that used in the relevant standards relating to line supplies (e.g. VDE-AR-4105). For under-excited operation (negative reactive current: r0076 < 0), the following applies: Lower output voltage or lagging current is identified with a positive sign. For over-excited operation (positive reactive current: r0076 > 0), the following applies: Higher output voltage or leading current is identified with a negative sign.

Description:	Sets the delay time for the ON/OFF1 command of the infeed. After ON/OFF1 = 0 the infeed remains in operation for the specified time		
Dependency:	Refer to: p0840		
Notice:	The ON/OFF1 command of the infeed can be interrupted.		
Note:	This parameter is only relevant if a Motor Module and the infeed are controlled by the same OFF command. In this case, the delay time and the stop ramp time of the motor can be coordinated with one another.

	Min	Max	Factory setting
	0 [ms]	65000 [ms]	2000 [ms]
Description:	Sets the monitoring time for the current-offset measurement of the power unit. The time is started with the normal end of the measurement. If the measurement is invalid and if no valid measurement can be taken within the monitoring period (phase currents too high), an appropriate message is generated.		
Note:	Set this parameter to 0 to allow variations in the delay when running-up.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [s]	300 [s]	0 [s]
Description:	Sets the delay time for shutdown due to a line supply undervoltage condition (F06100). After the line supply undervoltage is detected, the power unit is tripped (shut down) after this delay time has expired. If, during this delay time, the line supply undervoltage is no longer detected, then the power unit is not shut down. While the closed-loop control is being synchronized to the line supply (r3402 = 7) the delay time p3492 is not effective.		

Dependency: Refer to: p0283

Note: The degree of ruggedness of the infeed with respect to fluctuations in the line supply voltage can be increased by parameterizing this delay value.

However, the following should be noted:

- the infeed power decreases proportionally (linearly) with the line supply voltage.
- when other components are connected, for low line supply voltage, operating faults or damage can occur. In this case, the specifications of the connected electrical components should always be carefully observed.

p3508 Infeed step-up factor maximum / Step-up factor max

A_INF, R_INF	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.60	3.00	1.60

Description: Sets the maximum permissible step-up factor for the power unit used in conjunction with the line filter parameterized in p0220[0].

Dependency: Refer to: p0210, p0220, p3510

Note: The maximum step-up factor determines the maximum ratio between the DC link voltage setpoint (p3510) and the unit supply voltage (p0210).

The input of the DC link voltage setpoint (p3510) is limited corresponding to the permissible step-up factor (p3508):

$$p3510 \leq p0210 * p3508.$$

Pre-setting values:

380 ... 480 V booksize units without Active Interface Module: 1.60

380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00

380 ... 480 V chassis units: 2.00

500 ... 690 V chassis units: 2.00

Maximum values:

380 ... 480 V booksize units without Active Interface Module: 1.60

380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00

380 ... 480 V chassis units: 2.00

500 ... 690 V chassis units: 2.00

When the filter setting (p0220) is changed, then the setting of the maximum step-up factor (p3508) is also automatically adapted.

	100.00 [V]	1600.00 [V]	600.00 [V]

Description: Sets the setpoint for the DC link voltage.

Dependency: Refer to: p0210, p0280, p3400, p3508, p3511

Warning:

Before increasing the voltage limit for pulsed operation of a controlled booksize infeed with line supply voltages $p0210 > 415$ V it should be checked whether the motors connected to the DC link are specified for the higher motor voltages.

The warning information associated with p0210 must be carefully observed.

2 Parameters

2.2 List of parameters

Note: When the Smart Mode is activated (p3400.0 = 1) the DC link voltage is not regulated, i.e. the value entered here is in this case not effective.

The permissible range of the DC link voltage depends on the parameterized unit supply voltage (p0210) and the permissible, maximum continuous DC link voltage (p0280).

In voltage-controlled operation (p3400.0 = 0) the following applies:

$p3510 \geq 1.42 * p0210$ and

$p3510 \leq p3508 * p0210$ and

$p3510 \leq p0280$.

In the Smart Mode (p3400.0 = 1) the following applies:

The setpoint p3510 for the DC link voltage control is inactive. In order to permit an adapted display, deviating from voltage-controlled operation, the lower limit p3510 is $\geq 1.2 * p0210$.

Description:	Sets the motoring limit for the active line current. The currently effective current limit is displayed in r0067[0].		
Dependency:	Refer to: r0067, p3532		
Notice:	If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. Operating faults of the infeed can occur due to the resulting DC link undervoltage. For self-commutated infeeds, the DC link voltage decreases if more power is drawn from the DC link by the connected load than can be supplied by the line because of the power unit maximum current or a limit in p3530. If the DC link voltage decreases down to the rectified value, then the complete current - necessary to cover the required active power - flows, uncontrolled into the rectifier circuit via the diodes. This is the reason that, for physical reasons, the value in p3530 cannot act as current limit that is always maintained. The value forms a current threshold from which point onwards the DC link energy is used as buffer for brief power fluctuations.		
Note:	If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description:	Sets the limit for the active line supply current when regenerating. The currently effective current limit is displayed in r0067[1].		

Dependency: Refer to: r0067, p3533

Notice: If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. This can result in an overvoltage condition in the DC link.
For self-commutated infeeds, the DC link voltage increases if more power is input to the DC link through the connected source than can be fed to the line because of the maximum power unit current or a limit in p3531
If the DC link voltage exceeds the permissible threshold (p0297), defined by the hardware, then the unit is tripped due to overvoltage.
The value in p3531 represents a current limit that is always maintained - however, this can result in overvoltage conditions in the DC link.
The value in p3531 represents a current limit from which point onwards the capacitance of the DC link can be used as buffer for brief power fluctuations.

Note: If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description: Sets the signal source for inhibiting the motor mode of the infeed.

Dependency: Refer to: r3405, p3530

Notice: If the motor mode is inhibited although power is withdrawn from the DC link, then the DC link voltage drops to the rectified value.
In this state, the DC link is post-charged through the diodes and motoring power is fed to the power unit in spite of the motoring inhibit.

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: The inhibit only becomes active after operation has been enabled and the Vdc has been ramped up (r0863.0 = 1).
If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description:	Sets the fast Vdc controller intervention for a step-like decrease of the DC link voltage due to a high motor load of the infeed. The Vdc controller fast intervention is de-activated for p3555[5] = 0 % or p3560 < 100% or p0225 > 0.5 * p0223. For a line supply and DC link identification (p3410 >= 2) the level of the fast controller intervention (p3555[2]) is automatically adapted to the line supply inductance.			
Recommend.:	Precise system knowhow is required when correctly changing this parameter! - generally, the fast controller intervention is used to improve the control behavior for high-speed load changes. The function can therefore always be de-activated with p3555[5] = 0 % if no peak load duty cycles are required in the application. - using p3555[0], the calculation of the modulation depth is determined in the case of high system deviations also when the controller intervention is de-activated. This is the reason that p3555[0] should generally not be changed.			
Index:	[0] = Intervention threshold 1: Vdc deviation from the setpoint [1] = Intervention threshold 2: Vdc difference to the rectified value [2] = Fast intervention automatic scaling [3] = Fast intervention pre-control [4] = Fast intervention timeout [5] = Fast intervention manual scaling			
Note:	p3555[0]: Vdc system deviation as a percentage of the setpoint of the DC link voltage (first condition to initiate fast controller intervention). The threshold is also used to internally change over the modulation depth calculation for high system deviations and should therefore generally not be changed! p3555[1]: Vdc threshold as a percentage of the rectified value of the actual line supply voltage (second condition to initiate the fast controller intervention). Both threshold conditions must be fulfilled to initiate the controller intervention. p3555[2]: Percentage overall level of the fast intervention (scaling factor). For a line supply identification with p3410 >= 2, the factor is automatically adapted or, for weak line supplies with a high inductance, set to 0. p3555[3]: Percentage correction of the pre-control for a fast voltage dip (dead time compensation).

2.2 List of parameters

p3555[4]:

Percentage minimum time between two controller interventions (100% corresponds to 100 ms). If high load change frequencies occur with the application, the minimum time between two controller interventions can be reduced using p3555[4].

p3555[5]:

Percentage overall level of the fast intervention (scaling factor). With p3555[5] = 0, the fast controller intervention is inhibited. For weak line supplies with a high inductance, it makes sense to de-activate the fast intervention.

p3610	Infeed reactive current fixed setpoint / INF I_reactv F_set		
A_INF, R_INF	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -10000.0 [Arms]	Calculated: - Dyn. index: - Units group: 6_2 Scaling: - Max 10000.0 [Arms]	Access level: 2 Func. diagram: 8910, 8946 Unit selection: p0505 Expert list: 1 Factory setting 0.0 [Arms]
Description:	Sets the fixed setpoint for the reactive current. The permissible maximum absolute value for the reactive current is the device rated current r0207. The following applies: p3610 <= r0207		
Dependency:	Refer to: r0029, r0075, r0076		
Notice:	If the line phases are reversed and the line voltage therefore has a negative orientation (r0066 < 0), it should be noted that the sign of the reactive current is also reversed. The negated value of p3610 is effective in display parameters r0029, r0075, r0076 as appropriate.		
Note:	p3610 < 0: Inductive reactive current is produced, i. e. the current follows the voltage. p3610 > 0: Capacitive reactive current is produced, i. e. the current leads the voltage. This definition applies to 3AC voltage systems both with positive rotational orientation (r0066 > 0) and for negative rotational orientation (r0066 < 0).

Description:	Sets the time constant for the PT1 filtering of the active current actual value and reactive current actual value.		
Index:	[0] = Current actual value smoothing with dead time [1] = Current actual value smoothing without dead time		

Note: The current actual value filter is de-activated with p3614[0, 1] = 0.
 Re index 0:
 The PT1 filter with a clock cycle dead time can be used to stabilize the closed-loop current control for extremely weak line supplies (with higher relative short-circuit voltage uk).
 For an automatic controller setting with p3410 >= 2, the current actual value filter is automatically pre-set.
 Re index 1:
 The PT1 filter without dead time can be used to optimize the closed-loop current control (e.g. in conjunction with frequency wobulation).

A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Units group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100.00 [%]	40.00 [%]
Description:	Sets the switch-in threshold for the current controller adaptation. The value refers to the maximum power unit current (r0209). From the starting threshold onwards, the inductance value (p3421) used for current control is reduced linearly as a function of the current value. The inductance value for the maximum power unit current is therefore $p3421 * p3622$.		
Dependency:	Refer to: p3410, p3415, p3622		
Note:	The parameter can be set automatically using the line supply identification (p3410 = 4, 5) (also refer to p3622). Prerequisite for a reliable measurement of p3622 is that the current magnitude for run 2 (p3415[1]) is at least 10 % higher than the current magnitude for run 1 of the line supply identification. Otherwise, the measurement result is rejected. In the case of a correct measurement, p3620 is set to 80% of the current magnitude for run 1 (p3415[0]). For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415. For booksize power units, p3620 and p3622 are automatically adapted with the then valid default setting of the line identification p3415.

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01 [%]	100.00 [%]	85.00 [%]
Description:	Sets the inductance of the line reactor at the maximum power unit current (r0209) as a percentage of the inductance (p3421) at the application threshold (p3620).		
Dependency:	Refer to: p3410, p3415, p3620		
Note:	The parameter for a line supply identification (p3410 = 4, 5) automatically optimized, if the following applies: $p3415[1] - p3415[0] > 10\%$. Otherwise, the measurement result is rejected. For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415. For booksize power units, p3620 and p3622 are automatically adapted with the then valid default setting of the line identification p3415.		

p3624[0...1]	Infeed harmonics controller order / INF harm_ctr order		
A_INF, R_INF	Can be changed: T Data type: Unsigned16 P-Group: Closed-loop control Not for motor type: - Min 5	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max 13	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 5 [1] 7
Description:	Sets the Order of the line harmonics for the current harmonics controller. p3624[0]: Order of the line harmonics for the first harmonics controller. p3624[1]: Order of the line harmonics for the second harmonics controller.		
Dependency:	Refer to: p3625, r3626		
Note:	Harmonics in the line supply voltage can cause harmonics in the converter current. These types of current harmonics can be reduced by activating additional controller modules. Example: For a 50 Hz line supply harmonics at 250 Hz in the phase currents can be reduced by activating a harmonic controller with Order 5 (p3624[0] = 5).		
p3625[0...1]	Infeed harmonics controller scaling / INF harm_ctrl scal

Description:	Sets the gain of the harmonics controller. p3625[0]: Gain of the first harmonics controller p3625[1]: Gain of the second harmonics controller 0 %: Controller is de-activated 100 %: Controller is activated with default gain setting		
Dependency:	Refer to: p3624, r3626		
Note:	The harmonics controller corrects the power unit voltages so that the line-side current harmonics are reduced. The order of a current harmonic, that is to be dampened using a harmonics controller, is defined using p3624.

Description:	Sets the proportional gain Kp of the DC component controller. The DC component control is a very precise control without any remaining system deviation under steady-state operating conditions. It calculates a supplementary voltage for the output voltage of a power unit so that any DC component in the current can be counteracted. The controller is designed analytically based on a model of the controlled system comprising converter, line filter and transformer.		
Dependency:	The prerequisite for the "DC component control" function is that the "Line transformer" function module is activated (r0108.4 = 1). Refer to: r3648, p3649, p3651, r3652, p3654

Description:	Sets the alarm threshold for the change of the capacitance of the line filter. The monitoring of the filter capacitance is de-activated with p3676 = 0.00 %.		
Dependency:	Refer to: p3670		
Notice:	The following must be ensured before activating monitoring (e.g. p3676 = 10 %): Measured filter capacitance (r3677[0...2]) = 3 x filter capacitance (p0221) Otherwise, to establish this ratio, p3670 must be appropriately set. Example: The filter capacitance is specified with p0221 = 39 µF. In order that the measured capacitance is 3x so high, p3670 = 6.7 A must be set in the gain factor. p0221[0] = 39 µF r3677[0...2] = 3 x 39 = 117 µF --> p3670 = 6.7 A		
Note:	Prerequisites for monitoring the filter capacitance: The phase currents must be measured at two capacitors of the line filter. To do this, current transforms should be connected at the 10 V inputs of the Voltage Sensing Module (VSM).

	0.00 [%]	10000.00 [%]	[0] 0.00 [%] [1] 0.00 [%]
Description:	Sets the threshold values for filter monitoring. The voltage threshold value is referred to p0210. The current threshold value is referred to the nominal filter current. Nominal filter current = $2 \times PI \times p0211 \times 3 \times p0221[0] \times p0210 \times \sqrt{2} / \sqrt{3}$		
Index:	[0] = Voltage threshold value [1] = Current threshold value		
Dependency:	Refer to: r3671, r3672, r7310, r7311		
Note:	The filter monitoring function is de-activated with p3678 = 0.00. Recommended setting for activation: Voltage threshold value: 5.0 % Current threshold value: 500 %

	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to activate the DC link fast discharge for an internal braking module. When the following conditions apply, the DC link fast discharge is started later with delay time (p3682): - BI: p3681 = 1 signal. - an external line contactor is opened via r0863.1 "energize contactor". The DC link fast discharge is interrupted when the following conditions apply: - BI: p3681 = 0 signal. - ON command for the infeed.		
Recommend.:	The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults could occur when pre-charging (e.g. F30027).		
Dependency:	Refer to: p3682		
Notice:	The parameter is only effective for Basic Line Modules with the internal Braking Module (this is valid for Basic Line Modules with a power rating of less than 100 kW).

	-	-	0000 0000 0000 0000 bin	
Description:	Sets the configuration for APC (Advanced Positioning Control).			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Activating APC	Yes	No
	01	APC acceleration sensor	Yes	No
	08	Activating pulse de-coupling/speed weighting	Yes	No
Note:	Re bit 00: For a 1 signal, the acceleration filter output is added to the speed setpoint. For a 0 signal, the value 0 is added. This must be used to evaluate the filter frequency characteristics. Re bit 01: For a 1 signal, as APC actual value, the source of p3750 with high pass filtering is used. For a 0 signal, as APC actual value, the encoder actual value selected with p3701 is used. Re bit 08: For bit 0 = 1 and bit 8 = 1 (pulse decoupling/speed weighting activated), the speed from the direct measuring system (p3701) selected for APC, weighted with p3702, and the motor speed is used as actual value for the speed controller.

Description:	Sets the activation for the line-drive synchronization.		
Value:	0: Sync-line-drive de-activated 1: Sync-line-drive activated VSM-INT		
Dependency:	Refer to: p3801, p3802		
Caution: 	If there is only one VSM being used, this can either be used for line synchronization or for a flying restart. If the VSM was connected to the line supply, then flying restart should be deselected in p1200. If the VSM was connected at the output (motor side), then line synchronization should be deactivated using p3800. Line synchronization (first VSM connected with the line supply) and also flying restart (second VSM connected to the motor terminals) can only be used if two VSMs are assigned to the Motor Module.		
Note:	When the ground fault monitoring initiates a fault for overlapping synchronizing the threshold value p0287[1] for the Motor Module and the associated infeed must be appropriately increased (e.g. p0287[1] = 100 %). For p3800 = 1, the following applies: The INTERNAL voltage actual values are used for synchronization. The effects that a (sine-wave) filter - that is connected between the Motor Module and motor - has on the voltage actual values are taken into account (theoretically) by appropriately selecting p0230. VSM: Voltage Sensing Module

Note: Re bit 09:
For closed-control of an induction motors with encoder, the switchover between the current and observer model is displayed (see also r1751.19), if p3844 is > 0.
The following applies for bit 9 = 0 (observer model active):
The frictional torque is calculated from the characteristic values from the characteristic point entered into p3844.
The following applies for bit 9 = 1 (current model active):
The frictional torque is calculated from the characteristic values below the characteristic point entered into p3844.

Description:	<p>Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.</p> <p>The speed of this changeover point is preassigned when automatically calculating with the changeover speed p1752. The changeover point located below is preassigned with the changeover speed $p1752 * (1 - p1753)$.</p> <p>Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).</p> <p>Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.</p>		
Dependency:	<p>As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.</p> <p>Refer to: p3843</p>		
Notice:	<p>If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).</p>		
Note:	<p>For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.</p>

Value:	<p>0: Friction characteristic record de-activated</p> <p>1: Friction char record activated for all directions</p> <p>2: Friction char record activated for positive direction</p> <p>3: Friction char record activated for negative direction</p>		
Dependency:	<p>When selecting the friction characteristic measurement, the drive data set changeover is suppressed.</p> <p>For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.</p>		
Danger:	<p>For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.</p>		
			
Notice:	<p>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).</p>		
Note:	<p>When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).</p> <p>When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.</p> <p>When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.</p>

Description: Signal to energize terminal X21.1 "inhibit/acknowledgement" on the Braking Module.
This binector output is used as signal source to interconnect to a digital output.
For "booksize" formats the digital output must be connected to terminal X21.1 and for "chassis" formats the digital output must be connected to terminal X21.3 of the particular Braking Module.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Inhibit/acknowledge Braking Module 1	High	Low	-
	01	Inhibit/acknowledge Braking Module 2	High	Low	-

	06	Inhibit/acknowledge Braking Module 7	High	Low	-
	07	Inhibit/acknowledge Braking Module 8	High	Low	-

Warning:

Check that binector outputs BO: r3861.n are connected correctly and that the appropriate digital outputs are wired correctly.

If the interconnection/wiring is incorrect, the software could execute a different (incorrect) function via binector outputs BO: r3861.n if the Braking Module develops a fault.

Description: Sets the signal source to activate the DC link fast discharge.

The DC link fast discharge is started later with delay time (p3862) when the following conditions apply:

- BI: p3863 = 1 signal.
- an external line contactor is opened via r0863.1 "energize contactor".

The DC link fast discharge is interrupted when the following conditions apply:

- BI: p3863 = 0 signal.
- ON command for the infeed.

Recommend.: The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults could occur when pre-charging (e.g. F30027).

Dependency: Refer to: r3864

Note: The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

Dependency:

Refer to: p3863

Warning:

It must be carefully ensured that the binector outputs BO: p3864.n are correctly interconnected and also that the appropriate digital outputs are correctly connected up.

If the interconnection/connection is incorrect, in the case of an active DC link fast discharge, the software could execute another function (incorrect function) via binector outputs BO: p3864.n or could also permanently control the DC link fast discharge even if the line contactor is closed.

Note:

The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

Dependency:

Refer to: p3871, p3872, p3873, p3874, r3875, p3876, p3878, p3879

Notice: The following restrictions apply to this function:

- it is not permissible to change over the drive data set.
- the encoder/drive may not be parked using a PROFIBUS telegram.
- a maximum of 4 drives may be connected to the Control Unit.
- it is not permissible to commutate with the zero mark (p0404).

Note: Re bit 00:
All of the help functions for long stator motors can be enabled/disabled using this bit.
Re bit 01:
When the bit is set, bit 14 (parking encoder active) is set to 0 in the encoder status word GX_ZSW independent of whether the encoder is parked or not.

Description:	Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning. p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning. The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1). p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1. p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1F.		
Value:	0: No quick parameterization 1: Quick parameterization after parameter reset 2: Quick parameterization (only) for BICO and motor parameters 3: Quick parameterization for motor parameters (only)		
Notice:	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
Note:	When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

Description: Differential voltage for calibrating the offset for DC-link voltage measurement.

Dependency: Refer to: r0192, p0212

Caution: Incorrect use of the calibration can have a negative impact on the closed-loop control.

The parameter influences the upper and lower voltage detection.

Note: Parameter entries are directly saved in the DRIVE-CLiQ component involved.

The parameter is only effective in the case of booksize power units, if r0192.22 = 1 and p0212.0 = 1.

Description: Displays whether writing to parameters is inhibited.
 r3996[0] = 0:
 Parameter write not inhibited.
 0 < r3996[0] < 100:
 Parameter write inhibited. The value shows how the calculations are progressing.

Description:	Sets the limit for the total output voltage of terminals X541.1, X541.2, X541.3 and X541.4 (DI/DO 8 ... 11) of Terminal Module 31 (TM31).		
Value:	0: 0.1 A total current limit DI/DO 8 ... 11 1: 1.0 A total current limit DI/DO 8 ... 11		
Dependency:	Refer to: p4028		
Warning:	Since the sum of the output currents at terminals X541.1, X541.2, X541.3 and X541.4 is limited, an overcurrent or short circuit at one output terminal can cause a dip in the signal at the other terminals.

Description: Sets the scaling characteristic for the analog inputs of Terminal Module 31 (TM31).
The scaling characteristic for the analog inputs is defined using 2 points.
This parameter specifies the x coordinate (input voltage in V or input current in mA) of the 2nd value pair of the characteristic.

Index: [0] = AI 0 (X521.1/X521.2, S5.0)
[1] = AI 1 (X521.3/X521.4, S5.1)
Dependency: The unit of this parameter (V or mA) depends on the analog input type.
Refer to: r4056, p4056

Notice: This parameter is automatically overwritten when the analog input type (p4056) is modified.

Note: The parameters for the characteristic do not have a limiting effect.

Description:	Sets the sampling time for the inputs and outputs.		
Index:	[0] = S120M input/output sampling time		
Dependency:	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the SERVO clock cycle (p0115). Refer to: p0009		
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).

Description:	Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).			
Index:	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)			
Dependency:	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111). Refer to: p0009, r0110, r0111			
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. A/D converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is powered down. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

	31.25 [µs]	500.00 [µs]	125.00 [µs]	
Description:	The sampling time of the Terminal Module 15 (TM15) is determined by the DRIVE-CLiQ clock cycle of the line to which the component is attached. An entry is not possible using p4099. When switching on, p4099 is correctly set to the resulting sampling time.

Description:	Sets the sampling time for the inputs and outputs of Terminal Module 15 (TM15).			
Index:	[0] = TM15 input/output sampling time			
Dependency:	The parameter can only be modified for p0009 = 3, 29. The following applies for the sampling time: The sampling times at a DRIVE-CLiQ line must be integral multiples of one another. The sampling times of this TM must be an integral multiple of a servo or vector drive that exists in the system. The minimum permissible sampling time is 125 µs. Refer to: p0009, r0110, r0111			
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). Parameter p4099[0] must never be equal to zero.

2.2 List of parameters

Note: The value of the sampling time of the incremental encoder emulation p4099[3] can be pre-set in both operating modes (p4400). The next time that the system boots, the validity of the value is checked. For an invalid value, message F35228 and/or A01223 is output.
The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).
The sampling time of a TM41 in the SINAMICS mode (p4400 = 1) must be the same as that of the emulated encoder.
The sampling time of a TM41 in the SIMOTION mode (p4400 = 0) is determined by the topology used

Description:

Sets the delay time for the output of the fault for the Terminal Module 150 (TM150).

The timer is started when the alarm threshold (e.g. p4102[0]) is exceeded.

If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then the corresponding fault is output.

The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.

For sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:

- If the fault threshold (e.g. p4102[1]) is exceeded before the delay time has expired, then the corresponding fault is immediately output.

For sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:

- Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

Warning:

The fault F35207 ... F35210 and F35400 ... 35407 only results in the drive being shut down if at least one BICO interconnection exists between the drive and the TM150.

Note:

For p4103 = 0 s and sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:
 - The corresponding fault can only be initiated via the fault threshold (output of the timer is always a logical 0).
 For p4103 = 0 s and sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:
 - The corresponding alarm and fault are simultaneously output (delay time = 0 s).

Description: Sets the effect for an error of a sensor of a group for Terminal Module TM150 (TM150).
For p4117 = 0, the following applies:
The defective temperature sensor assigned to a group is not take into account when forming the group.
For p4117 = 1, the following applies:
For a sensor error, for the maximum value, minimum value and average value of the corresponding group, a value of -300 °C is output.

Note:	<p>Re bit 00, 01: This bit is used to configure the zero mark via X520. When the TM41 is operated in the SINAMICS mode (p4400 = 1), the following applies: A new zero mark search is initiated by switching in the zero mark at the TM41 (p4401.0 = 1). The zero mark is output at the TM41 as soon as it was synchronized with the zero position/zero mark of the leading encoder. For p4401.1 = 1, the following applies: The zero pulse is only output via X520 when the absolute encoder passes the zero position of the absolute position (modulo converted). For p4401.1 = 0, the following applies: The zero pulse is output via X520 compatible with previous firmware versions (< V4.3). The zero pulse is output when the TM41 (modulo converted) passes the position it was in when the 24 V supply was switched on.</p> <p>Re bit 07: For hardware versions A and B, this bit has no significance (output frequency = 512 kHz). For p4401.7 = 0, the following applies: The maximum output frequency is 750 kHz (from hardware version C). For p4401.7 = 1, the following applies: The maximum output frequency is 1024 kHz (from hardware version C).</p>

Description: Sets the signal source for the incremental encoder emulation position setpoint.
Recommend.: The position actual value of the leading encoder in the current controller clock cycle is available in r0479.
 This is the reason that the following BICO interconnection should be preferably set:
 CI: p4420 (TM41) = r0479 (e.g. SERVO)
Dependency: Refer to: p4400, r4403
Notice: General conditions for incremental encoder emulation can be found in the following literature:
 SINAMICS S120 Function Manual Drive Functions

Note: The parameter is not effective in the SIMOTION operating mode (p4400 = 0).
 An encoder actual value (r0479) can only be interconnected once on a TM41.
 For p4401.0 = 1(enable zero mark), the following applies:
 In this case, p4420 must be interconnected with r0479 of the leading encoder.
 After successful internal, automatic synchronization, the zero mark of the incremental encoder emulation is output in synchronism to the zero position/zero mark of the leading encoder.
 The zero position of the leading encoder depends on the encoder type and the selected referencing technique (p0493, p0494, p0495).

Description: Sets the deadtime compensation for incremental encoder emulation.
 This factor defines the multiplier in which the encoder position setpoint of the incremental encoder emulation is shifted depending on the velocity.

Dependency: For p4421 = 0, the deadtime compensation for the position setpoint is switched out.
 For p4421 <> 0, the deadtime compensation is taken into account as follows:
 Setpoint new = setpoint via CI: p4420 + delta s * p4421
 delta s: Position change per sampling time (p4099[3]), internally smoothed
 Refer to: p4400

Note: The parameter is not effective in the SIMOTION operating mode (p4400 = 0).

p4422	TM41 encoder emulation position setpoint inversion / Enc_emul s_set inv

Description: Setting to invert the position setpoint for Terminal Module 41 (TM41).
 0 -> Position setpoint (CI: p4420) is evaluated as normal.
 1 -> Position setpoint (CI: p4420) is processed inverted.

Dependency: Refer to: p4420

p4423	TM41 encoder emulation standstill adaptation / Enc_standst_adapt		
TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2000	4

Description: Sets standstill adaptation on Terminal Module 41 (TM41).
 p4423 is used to specify the number of clock cycles (one clock cycle = p4099[3]) used for encoder standstill detection. Once this time has elapsed, any potential deviation is compensated when adaptation is active.
 Parameter value = 0: adaptation inactive
 Parameter value > 0: adaptation active

Dependency: Refer to: r4403, p4404, p4420

2 Parameters

2.2 List of parameters

Danger:

The option p4404.1 = 1 is only effective if TM41 DAC is being used.

If the possibility of a TM41 DAC (new) being replaced by a TM41 SAC (old) cannot be excluded, this option should not be set.

TM41 SAC: order no. = 6SL3055-0AA00-3PA0

TM41 DAC: order no. = 6SL3055-0AA00-3PA1

Note:

The parameter is only effective in the SINAMICS operating mode (p4400 = 1).

The parameter value must be assigned a value of 4 or more to ensure that the system functions properly.

This parameter is only relevant in the following cases:

- TTL encoder is available

- the controller option "Pre-control with adaptation for TTL encoder" has been activated (p4404.1 = 1)

Description:

Sets pulse number to output the zero mark for the incremental encoder simulation/emulation.

Example:

p0408 = 2048 (encoder pulses)

p4426 = 512 (pulses for the zero mark)

--> Position direction: The zero mark is output after 512 pulses.

--> Negative direction: The zero mark is output after 1536 pulses.

Dependency:

Refer to: p0408

Note:

The pulses for the zero mark (p4426) must be less than the encoder pulse number (p0408).

13	Commutation angle constant	Yes	No	-
14	Suppress faults	Yes	No	-
31	Extrapolation	ON	OFF	-

Notice:

Re bit 06:

Setting the bit sets the velocity actual value (r0061) permanently to 0.

Re bit 13:

Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).

Note:

Re bit 09:

A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.

A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.

Re bit 10, 11:

If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated.

Re bit 14:

The bit is only evaluated for encoder 1. Otherwise no effect.

Description:	Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, then the pulse number is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
Dependency:	Refer to: p0437, p4688		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC.

Description:	Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
Dependency:	Refer to: p0437, p4681, p4688		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

Description:

Setting to back up the data of all SMIs and DQIs featured in the target topology.

Value:

- 0: Inactive
- 1: Save data of all SMIs and DQIs
- 10: Save all data successful
- 13: Insufficient memory space for backup
- 16: Transfer fault during data backup
- 20: Component does not contain any data
- 29: Not all components from target topology saved

Note:

CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: T Data type: Unsigned16 P-Group: Displays, signals Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 399	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0	
Description:	Sets the directory for downloading and saving data. Example: The SMI has the component number 5 and the SMI data (motor/encoder data) is to be stored in subdirectory C205. --> p4690 = 5, p4693[0] = 205, p4691 = 1 [0] = Subdirectory selection [1] = Reserved			
Index:	Refer to: p4691, r4694			
Dependency:	If p4693[0] is not equal to 0 and p4693[0] is not equal to p4690, the following applies: - Only a number >= 200 may be selected for the subdirectory when saving. - In the case of downloads, a selection for the subdirectory may only be made for an SMI/DQI with a component number >= 200 (preliminary component number) (p4690 >= 200).			
Notice:	DQI: DRIVE-CLiQ Sensor Integrated SMI: SINAMICS Sensor Module Integrated Re index 0: This index is used to select the subdirectory for saving and downloading data. The motor order number (MLFB) of the corresponding data backup is displayed in r4694. For p4693[0] = 0, the following applies: The directory is determined by the setting of p4690.

Description:	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

Description:	Displays the recorded data type 8 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4795	Trace memory bank changeover / Trace mem changeov		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 500	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Changes over the memory bank to read out the contents of the trace buffer.		
Dependency:	Refer to: r4740, r4741, r4742, r4743, r4750, r4751, r4752, r4753		
r4797[0...1]	Trace 0 trigger instant / Trace 0 t_trigger		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the instant in time for fulfilling the trigger condition for trace recorder 0. The time comprises milliseconds (index 0) and days (index 1).		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r2114, r3102, r4719		
Notice:	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a μs accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.		
Note:	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).		
r4798[0...1]	Trace 1 trigger instant / Trace 1 t_trigger		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the instant in time for fulfilling the trigger condition for trace recorder 1. The time comprises milliseconds (index 0) and days (index 1).		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r2114, r3102, r4719		
Notice:	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a μs accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the free memory for the trace in bytes.		
Dependency:	Refer to: r4708		

p4800	Function generator control / FG control		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	The function generator is started with p4800 = 1. The signal is only generated for a 1 signal of binector input p4819.		
Value:	0: Stop function generator 1: Start function generator 2: Check function generator parameterization 3: Start function generator without enable signals		
Dependency:	Refer to: p4819		

r4805	Function generator status / FG status		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 6	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the actual status of the function generator.		
Value:	0: Inactive 1: Generate accelerating ramp to offset 2: Generate parameterized signal shape 3: Generate braking ramp 4: Function generator stopped due to missing enable signals 5: Function generator waits for BI: p4819 6: Function generator parameterization has been checked		
Dependency:	Refer to: p4800, p4819

2.2 List of parameters

p4815[0...2]	Function generator drive number / FG drive number		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 65535	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the required drive where the function generator is to be connected.		
Index:	[0] = First drive for connection [1] = Second drive for connection [2] = Third drive for connection		
Dependency:	Only effective when p4810 = 1, 2, 3, 4 or 5.		
Note:	For the function generator, only type SERVO, VECTOR or DC_CTRL type drives can be used.		
p4816	Function generator output signal integer number scaling / FG outp integ scal		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer32 P-Group: - Not for motor type: - Min -2147483648	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2147483647	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the scaling for the integer number of the output signal for the function generator.		
Dependency:	Refer to: r4805, r4817		
Note:	The parameter can only be changed in the following operating states: r4805 = 0, 4, 6		
r4817	CO: Function generator output signal integer number / FG outp integ no.		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Integer32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Display and connector output for the integer number of the output signal for the function generator.		
Dependency:	Refer to: p4816		
Note:	The value is output independent of the function generator operating mode.		
r4818	CO: Function generator output signal / FG outp_sig		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting - [%]
Description:	Displays the output signal for the function generator.		
Dependency:	Refer to: p4810		
Note:	The value is displayed independently of the function generator mode.		

p4819	BI: Function generator control / FG control		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1
Description:	Sets the signal source to control the function generator. When the function generator is running, signal generation is stopped with a 0 signal from BI: p4819 and p4800 is set to 0.		
Dependency:	Refer to: p4800		
p4820	Function generator signal shape / FG signal shape		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 1	Calculated: - Dyn. index: - Units group: - Scaling: - Max 5	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1
Description:	Sets the signal to be generated for the function generator.		
Value:	1: Square-wave 2: Staircase 3: Delta 4: Binary noise - PRBS (Pseudo Random Binary Signal) 5: Sine-wave		
p4821	Function generator period / FG period duration		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 60000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1000.00 [ms]
Description:	Sets the period of the signal to be generated for the function generator.		
Dependency:	Ineffective when p4820 = 4 (PRBS).		
p4822	Function generator pulse width / FG pulse width		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 60000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 500.00 [ms]
Description:	Sets the pulse width for the signal to be generated for the function generator.		
Dependency:	Only effective when p4820 = 1 (square-wave).		

2 Parameters

2.2 List of parameters

p4823	Function generator bandwidth / FG bandwidth		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.0025 [Hz]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 16000.0000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 4000.0000 [Hz]
Description:	Sets the bandwidth for the signal to be generated for the function generator.		
Dependency:	Only effective when p4820 = 4 (PRBS). Refer to: p4830		
<hr/>			
p4824	Function generator amplitude / FG amplitude		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 5.00 [%]
Description:	Sets the amplitude for the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		
<hr/>			
p4825	Function generator 2nd amplitude / FG 2nd amplitude		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 7.00 [%]
Description:	Sets the second amplitude for the signal to be generated for the function generator.		
Dependency:	Only effective for p4820 = 2 (staircase). Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		
<hr/>			
p4826	Function generator offset / FG offset		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.00 [%]
Description:	Sets the offset (DC component) of the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The offset is referred to p2002 (reference current). If p4810 = 3, 5: The offset is referred to p2000 (reference speed). If p4810 = 2: In order to avoid the undesirable effects of play (backlash), the offset does not act on the current setpoint, but instead on the speed setpoint.		

p4827	Function generator ramp-up time to offset / FG ramp-up offset		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 32.00 [ms]
Description:	Sets the ramp-up time to the offset for the function generator.		
p4828	Function generator lower limit / FG lower limit		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -10000.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 0.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -100.00 [%]
Description:	Sets the lower limit for the function generator.		
Dependency:	For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).		
p4829	Function generator upper limit / FG upper limit		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00 [%]
Description:	Sets the upper limit for the function generator.		
Dependency:	For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).		
p4830	Function generator time slice cycle / FG time slice		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.03125 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2.00000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.12500 [ms]
Description:	Sets the time slice cycle in which the function generator is called.		
p4831	Function generator amplitude scaling / FG amplitude scal		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00000 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 200.00000 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]
Description:	Sets the scaling for the amplitude of the signal waveforms for all output channels. The value can be changed while the function generator is running.		

2 Parameters

2.2 List of parameters

p4832[0...2]	Function generator amplitude scaling / FG amplitude scal		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 340.28235E36 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]

Description: Sets the scaling for the amplitude of the signal waveforms separately for each output channel.
The value cannot be changed while the function generator is running.

Index: [0] = First drive for connection
[1] = Second drive for connection
[2] = Third drive for connection

p4833[0...2]	Function generator offset scaling / FG offset scal		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 340.28235E36 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]

Description: Sets the scaling for the offset of the signal waveforms separately for each output channel.
The value cannot be changed while the function generator is running.

Index: [0] = First drive for connection
[1] = Second drive for connection
[2] = Third drive for connection

r4834[0...4]	CO: Function generator free measurement output signal / FG fr MeasFct outp		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting - [%]

Description: Displays the output signal for the free measurement function.

Index: [0] = Signal 1
[1] = Signal 2
[2] = Signal 3
[3] = Signal 4
[4] = Signal 5

Dependency: Refer to: p4810

Note: The signals are only output in the "free measurement function" operating mode (p4810 = 6)

p4835[0...4]	Function generator free measurement function scaling / FG fr MeasFct scal		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -200.00000 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 200.00000 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]
Description:	Sets the scaling of the output signals for the free measurement function.		
Index:	[0] = Signal 1 [1] = Signal 2 [2] = Signal 3 [3] = Signal 4 [4] = Signal 5		
Note:	The parameter cannot be changed when the measurement function has been started (r4706 = 2, 3).		
p4840[0...1]	MTrace cycle number setting / Cycle number		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the number of cycles of a multiple trace. The multiple trace is de-activated with a value = 0.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: r4841, p4844		
Notice:	A multiple trace can have a negative impact on the total system performance. From their inherent principle of operation, flash memory cards are subject to wear as a result of write operations. As a consequence, the lifetime of flash memory cards is reduced when using the multiple trace functionality.		
r4841[0...1]	MTrace cycle actual display / Cycle act display		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the currently running cycle (including deadtime) of the multiple trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: p4840, p4844		

p4844[0...1]	MTrace ring buffer files number / Ring buff file qty		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: T Data type: Unsigned16 P-Group: Trace and function generator Not for motor type: - Min 10	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 10

Description: Sets the number of ring buffer files for the measurement results of the multiple trace.

Index: [0] = Trace 0
[1] = Trace 1

Dependency: Refer to: p4840, r4841

r4899	Status word sequence control / ZSW seq_ctrl		
TM41	Can be changed: - Data type: Unsigned16 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displays the status word of the sequence control from Terminal Module 41 (TM41).

Description:	Display and connector output for the clamped state. Message A3x940 is output in states 2 and 11. The voltage threshold values for the states can be set using parameter p5041. The hysteresis is adapted using parameter p5040. The transition from state 4 to states 7, 8 or 10 can be influenced by the wait time p5042[0]. A transition is made into state 10 if the analog value in p5002 falls below the voltage threshold value in p5041[4]. However, if the analog value p5002 lies below the voltage threshold value in p5041[2] and the wait time in p5042[0] has expired, then a transition is made into state 7 or 8 - otherwise state 4 is kept.

Note: This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).
The action to adapt the selected files is selected in p5009.

Re bit 01:

The action selected in p5009 only becomes immediately effective for this bit.

Re bit 02 ... 22:

Only for internal Siemens use.

For this bit, after setting p5009, a hardware reset is required.

Description: Setting to adapt the file system on the non-volatile memory.

Example:

The result data "clamping cycle thresholds" are available (r5005.1 = 1) and should be reset.

--> set p5007.1 = 1: select result data "clamping cycle thresholds".

--> set p5009 = 1: initiate "reset" function for the file selected in p5007.

--> p5009 = 40: feedback signal during "operation running".

--> p5009 = 20: feedback signal for a successfully completed operation.

--> p5009 = 51 ... 53: fault values if the operation was not able to be successfully completed.

--> carry out a POWER ON (power off/on).

Value:	0:	No function
	1:	Reset
	2:	Set invalid
	3:	Reserved
	5:	Set valid
	20:	Operation successfully completed.
	40:	Operation running
	51:	Function not supported
	52:	File access unsuccessful
	53:	Operation unsuccessful

Note: This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).
 Help for fault value = 51 ... 53:

Description: Setting to enable/inhibit spindle commissioning.
 Enabling spindle commissioning results in the spindle parameters being reset after commissioning has been initiated (e.g. via p0340 > 0 or p3900 > 0).

Depending on the spindle configuration, the following parameters are reset:
 p0353, p0410, p0431, p0922, p1231, p1300, p1980, p1981, p1982

Value:	0:	Spindle commissioning enabled
	1:	Spindle commissioning inhibited

Dependency: Refer to: p0340, p3900

Note: This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).
 The parameter is automatically set to a value of 1 after exiting commissioning (p0009 = 0).

Dependency:	Current setpoint filter 10 is activated via p5200.5 and parameterized via p5227 ... p5230.		
Note:	For a general 2nd-order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$

Description:	Sets the configuration for the online tuning.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	PD controller for large load moments of inertia	Yes	No	-
	01	Reduce gain at low speeds	Yes	No	-
	02	Load adaptation Kp	Yes	No	-
	03	Speed pre-control	Yes	No	-
	04	Torque pre-control	Yes	No	-
	05	Setting maximum acceleration limiting	Yes	No	-
	06	Do not change Kp	Yes	No	-
Dependency:	Refer to: p5272, p5273, r5274, p5275				

Note: Re bit 00:
For significant differences between the motor and load moment of inertia, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased.
This function should only be set when the speed pre-control (bit 3 = 1) or the torque pre-control (bit 4 = 1) is active.

Re bit 01:
At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.

Re bit 02:
The estimated load moment of inertia is taken into account for the speed controller gain (see p5273).

Re bit 03:
Activates the speed pre-control for the basic positioner (EPOS).

Re bit 04:
Activates the torque pre-control for the basic positioner (EPOS).

Re bit 05:
The maximum setpoint acceleration for the basic positioner (EPOS) is determined based on the estimated moment of inertia. This is realized by activating the bit once.
The prerequisite is that the drive pulses are inhibited, and the moment of inertia was previously determined.

Re bit 06:
The speed controller gain set in p1460 is not changed when calculating the controller data.

p5272[0...n]	Onlinetuning dynamic factor / Ot dyn_factor		
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 5.0 [%]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 1000.0 [%]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [%]
Description:	Sets the dynamic factor for the P gain of the speed controller for onlinetuning.		
Dependency:	Refer to: p5271, p5273, r5274, p5275		
Notice:	The speed control can become unstable for excessively high values.		
Note:	The stiffer the mechanical load coupling, the higher the dynamic factor can be set.		

p5273[0...n]	Onlinetuning dynamic factor load / Ot dyn_factor load		
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.0 [%]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 100.0 [%]	Access level: 4 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting 30.0 [%]
Description:	Sets the dynamic factor for the P gain of the speed controller for onlinetuning. The value specifies which component of the estimated load moment of inertia is taken into account when adapting the speed controller.		
Dependency:	Refer to: p5271, p5272, r5274, p5275		
Notice:	The speed control can become unstable for excessively high values.		

r5274	CO: Onlinetuning dynamic estimated / Ot dyn estimate		
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min - [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [ms]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting - [ms]
Description:	Display and connector output for the estimated dynamic response of the speed control loop as PT1 time constant for onlinetuning.		
Dependency:	Refer to: p5271, p5272, p5273, p5275		
p5275[0...n]	Onlinetuning dynamic time constant / Ot dyn T		
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.0 [ms]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 60.0 [ms]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting 7.5 [ms]
Description:	Sets the time constant for the pre-control symmetrization for onlinetuning. As a consequence, the drive is allocated a defined, dynamic response via its pre-control. For drives, which must interpolate with one another, the same value must be entered. Examples: 0 ms = travel without following error (Kv factor is infinity) 5 ms = settling behavior as for PT1 with 5 ms (Kv factor = 12 [1000/min])		
Dependency:	Refer to: p5271, p5272, p5273, r5274		
Notice:	This time constant is only effective if p5302.7 = 1. Otherwise, the pre-control symmetrization is adapted to the estimated dynamic response, therefore setting positioning without any overshoot.		
p5280[0...n]	Current setpoint filter adaptation configuration / Filt adapt config		
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min -1	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the configuration for the adaptive current setpoint filter. The adaptation acts on the filter set using p5281.		
Value:	-1: Inactive and filter deactivated 0: Inactive 1: Active		
Dependency:	The prerequisite for the adaptation of the current setpoint filter is that the "Moment of inertia estimator" function module is activated (r0108.10). Refer to: p5281, p5282, p5283, p5284, r5285		
Notice:	If, when activating adaptation (p5280 = 1), the filter assigned via p5281 is still not active, then it is automatically activated.		
Note:	If p5280 = -1: The adaptation is deactivated and the assigned filter deactivated. If p5280 = 0: The adaptation is inactive. The actual setting of the filter parameters is kept in a volatile memory. To permanently save the values that have been determined, the parameters must be saved in a non-volatile memory (p0977 = 1). If p5280 = 1: The adaptation is active. When a mechanical resonant frequency is excited, the filter frequency is adapted. Adaptation is temporarily inactive while the function generator generates a noise signal (p4820 = 4).		

p5281[0...n] Current setpoint filter adaptation assignment / Filt adapt assign			
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 10	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the current setpoint filter that is to be adapted. Value = 0: No assignment Value = 1: Current setpoint filter 1 assigned (basic system) ... Value = 4: Current setpoint filter 4 assigned (basic system) Value = 5: Current setpoint filter 5 assigned (function module, r0108.21) ... Value = 10: Current setpoint filter 10 assigned (function module, r0108.21)		
Dependency:	Refer to: p5280, p5282, p5283, p5284, r5285		
Notice:	Fault F7419 is generated if this setting is changed when adaptation is active.		
Note:	If, when activating adaptation (p5280 = 1), the selected filter is still not active, then it is automatically activated.		
p5282[0...n] Current setpoint filter adaptation limit frequency lower / Filt adapt f lower			
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 50 [Hz]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 5000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 250 [Hz]
Description:	Sets the lower limit frequency for the current setpoint filter adaptation. If the actual frequency of the adapted filter falls below the lower limit frequency, then the frequency of the adapted filter is set to the lower limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation.		
Dependency:	Refer to: p5280, p5281, p5283, p5284, r5285		
Note:	If a value is entered, which exceeds the upper limit frequency (p5283), then the value is rejected.		
p5283[0...n] Current setpoint filter adaptation limit frequency upper / Filt adapt f upper			
SERVO (J_estimator), SERVO_AC (J_estimator), SERVO_I_AC (J_estimator)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 200 [Hz]	Calculated: - Dyn. index: DDS, p0180 Units group: - Scaling: - Max 10000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1500 [Hz]
Description:	Sets the upper limit frequency for the current setpoint filter adaptation. If the actual frequency of the adapted filter exceeds the upper limit frequency, then the frequency of the adapted filter is set to the upper limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation. There is an internal maximum value for the upper limit frequency; this depends on the damping (attenuation) of the adapted filter and the current controller sampling time. If the parameterized value exceeds the internal maximum value, then the following applies: - this parameter is immediately limited to the internal maximum value if adaptation is active. - this parameter is limited to the internal maximum value the next time that adaptation is activated (p5280).		
Dependency:	Refer to: p5280, p5281, p5282, p5284, r5285		
Note:	If a value is entered, which falls below the lower limit frequency (p5282), then the value is rejected.

Description:	Sets activation/de-activation of the "auto tuning" function. To permanently save the values that have been set, the parameters must be saved in a non-volatile memory (p0977 = 1). The individual measuring steps can be configured in the following parameters: p5301 for "One Button Tuning" (p5300=1) - this function is being prepared p5302 for "Online Tuning" (p5300=2)		
Value:	Sets activation/de-activation of the "onlinetuning" function. The following parameters are written to when online tuning is activated: p430, p1160, p1400, p1413 - p1426, p1428, p1429, p1433 - p1435, p1441, p1460 - p1465, p1498, p1513, p1656 - p1676, p2533 - p2539, p2567, p2572, p2573, p5280 -1: Reset (restore default values) 0: Inactive 1: One Button Tuning 2: Online Tuning		
Dependency:	The prerequisite for the "auto tuning" function is that the "Moment of inertia estimator" function module is activated (r0108.10). Refer to: p5301, p5302		
Warning:	Only the motor measuring system is taken into account when optimizing the position controller. If an external measuring system is used for the position control, then this can result in an unstable controller setting.		
Caution:	For some drive trains, the "onlinetuning" function can result in unstable settings. (motor makes a whistling sound). This is especially the case for high load moments of inertia, which are coupled to the motor through a low-frequency connection/coupling. This case, parameter p5272 or p5273 must be reduced.		
Note:	If p5300 = -1: Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the speed and position controller are restored.		
	If p5300 = 0: Online tuning is inactive. To permanently save the values determined for the speed and position controllers, the parameters must be saved in a non-volatile memory (p0977 = 1). The results of the moment of inertia estimator can be reset using p5300 = 0. The moment of inertia and the tuning parameters must be redetermined after p5300>0.		
	If p5300 = 1: One Button Tuning is active. The moment of inertia is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source.		
	If p5300 = 2: Onlinetuning is active. The moment of inertia is estimated. The controller parameters are recalculated if the moment of inertia noticeably changes.

2 Parameters

2.2 List of parameters

Dependency: This parameter can only be changed if p5300=0 has been parameterized.

Refer to: p5300, p5307, p5308, p5309

Caution:

Please note the general conditions of the moment of inertia estimator, online tuning and adaptive resonance filter. See Function Manual FH1.

Note:

Re bit 00: being prepared

The speed controller gain is determined and set using a noise signal.

Re bit 01: being prepared

Possibly required current setpoint filters are determined and set using a noise signal.

As a consequence, a higher dynamic performance can be achieved in the speed control loop.

Re bit 02:

Using this bit, the moment of inertia is determined while traversing (moment of inertia estimator). If this bit is not set, then the load moment of inertia must be manually parameterized in parameter p1498.

Re bit 03:

If "once" has been parameterized, then after successfully determining the moment of inertia p1498 the moment of inertia estimator is deactivated.

If "Cyclic" has been parameterized, then the moment of inertia is continually determined and the controller parameters adapted. After the moment of inertia has been successfully determined ($r1407.26=1$), we recommend that the parameter is saved. This means that after power on, the controller does not have to re-stabilize.

Re bit 06:

The adaptation of a current setpoint filter can be set here. See p5280-p5285.

This adaptation may be necessary if a mechanical resonance frequency changes in operation. It can also be used to dampen a fixed resonance frequency. Once the control loop has stabilized, this bit should be deactivated and the determined parameters saved in a non-volatile fashion.

Re bit 07:

With this function, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

Note:	Re index 0: So that closed-loop DC-link voltage control is activated by the VECTOR drive object's technology controller (due to closed-loop DC-link voltage control for the infeed being de-activated) the following BICO interconnection must be set: BI: p3513 (VECTOR) = r5402.0 (A_INF) Re index 1: When the setpoints are deactivated, the smoothed actual values of these variables are used for the no-load values of frequency and voltage. p5409	Line droop control frequency droop smoothing time / Line drp f t_sm		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10000.00 [ms]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 150.00 [ms]
Description:	Sets the smoothing time for the output frequency of the active power frequency droop (r5410).		
Dependency:	Refer to: p5405		
Note:	When the load changes, mechanical energy generation units induce a delayed change in frequency on account of their inertia. The converter tries to emulate this response with the assistance of the smoothing time. For the line to remain stable, all the energy generation units in a separate network have to respond in a similar manner during operation.

r5410	Line droop control frequency droop output / Line drp f outp		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [Hz]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [Hz]
Description:	Displays the smoothed output frequency of the active power frequency droop. Droop formula (without smoothing): $r5410 = (p5405 + p5406 + p5407 * r5411[0] / r0206) * p0211$		
Dependency:	Refer to: p5405		
<hr/>			
r5411[0...1]	Line droop control frequency droop active power / Line drp f P_act		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [kW]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [kW]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [kW]
Description:	Displays the input active power of the active power frequency droop. The active power is calculated for the currents and voltages defined with connector inputs p5403 and p5404.		
Index:	[0] = Unsmoothed [1] = Smoothed		
Dependency:	Refer to: p5409		
Note:	Re index 1: The value is smoothed using a PT1 filter (smoothing time: p0045).		
<hr/>			
r5412	Line droop control line angle / Line drp angle		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°]	Calculated: - Dyn. index: - Units group: - Scaling: p2005 Max - [°]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [°]
Description:	Displays the actual line angle for line droop control. The value is calculated by integrating the output frequency of the active power frequency droop (r5410).		

p5413	Line droop control additional frequency droop gradient / Line droop add-f		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10000.0 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 0.0 [%]
Description:	Sets the gradient for the additional, fast frequency droop. The reference quantity is the gradient for the regular frequency droop (p5407). The settings for the regular frequency droop (p5405 onwards) apply to the other droop parameters. As a result of the short smoothing time, the supplementary frequency droop acts similar to a D component – and therefore as dampening factor for the closed-loop line control.		
Recommend.:	Typical setting values lie between 50% and 100%.		
Dependency:	Refer to: p5414, p5476		
Note:	For example, a strong frequency dip can be generated when the load is connected with the additional frequency droop, and this can be used to emulate the behavior of a diesel generator. The frequency is initially changed with the smoothing time p5414 in accordance with the additional droop, reaching the stationary end value in accordance with the time constant p5409 for the regular frequency droop. The additional droop is de-activated with p5413 = 0.		
p5414	Line droop control additional frequency droop smoothing time / Line droop add-t		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 10.0 [%]
Description:	Sets the smoothing time for the additional, fast frequency droop. The reference quantity is the smoothing time for the regular frequency droop (p5409).		
Recommend.:	Typical setting values lie between 10% and 20%.		
Dependency:	Refer to: p5413		
Note:	The smoothing time for the additional, fast frequency droop is less than or equal to the time constant for the regular frequency droop.		
p5415	Line droop control voltage droop no-load voltage / Line drp U_no-ld		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 30.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max 300.00 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the no-load voltage (as a % of p0210) for the reactive current voltage droop for line droop control. Droop formula (without smoothing): $p5420 = (p5415 + p5416 + p5417 * r5421[0] / r0207) * p0210$		
Dependency:	Refer to: p5419		
Note:	The droop characteristic input variable is the reactive power r5421[0] at the selected connection point (p5403, p5404). The output voltage calculated using the above formula is filtered in accordance with the parameterized smoothing time p5419. The smoothed output voltage is displayed in r5420.

A_INF (Line droop ctrl, Line transf), R_INF (Line droop ctrl, Line transf)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max -	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting [0] 0 [1] 5582[1]
Description:	Sets the signal source for the voltage droop supplementary setpoint (as a % of p0210).		
Index:	[0] = Supplementary setpoint is smoothed [1] = Supplementary setpoint direct		
Dependency:	Refer to: p5415		
Notice:	Re index 1: Setpoint steps without smoothing can result in significant equalization operations in the line supply and the overload of the inverter and the line components.		
Note:	Re index 0: The setpoint signals are PT1-filtered with the time constant p5419. Re index 1: If the signals for the unsmoothed setpoints are precisely reset to 0 (e.g. for p5483[3] = 1), then by internally adapting the smoothed setpoint state, an undesirable step-like voltage change is avoided. The signal for the smoothed setpoint should be adapted using a corresponding voltage change, if the output voltage is to be kept constant.		
p5416[0...1]	CI: Line droop control voltage droop supplementary setpoint / L drp U_suppl_setp

Description:	Sets the signal source for the voltage droop supplementary setpoint (as a % of p0210).		
Index:	[0] = Supplementary setpoint is smoothed [1] = Supplementary setpoint direct		
Dependency:	Refer to: p5415		
Notice:	Re index 1: Setpoint steps without smoothing can result in significant equalization operations in the line supply and the overload of the inverter and the line components.		
Note:	Re index 0: The setpoint signals are PT1-filtered with the time constant p5419. Re index 1: If the signals for the unsmoothed setpoints are precisely reset to 0 (e.g. for p5483[3] = 1), then by internally adapting the smoothed setpoint state, an undesirable step-like voltage change is avoided. The signal for the smoothed setpoint should be adapted using a corresponding voltage change, if the output voltage is to be kept constant.		
p5417	Line droop control voltage droop gradient / Line drp U grad		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100.00 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 5.00 [%]
Description:	Sets the gradient of the voltage droop (as a % of the rated voltage p0210 at the rated current r0207).		
Dependency:	Refer to: p5415		

p5418	CI: Line droop control voltage droop gradient dynamic / Line drp U grad dy		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: PERCENT Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the additional gradient of the voltage characteristic.		
p5419	Line droop control voltage droop smoothing time / Line drp U t_sm		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10000.00 [ms]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 150.00 [ms]
Description:	Sets the smoothing time for the reactive current actual value (r5421[1]). The smoothed reactive current is the input quantity for the reactive current voltage droop.		
Dependency:	Refer to: p5415		
Note:	When the load changes, mechanical energy generation units induce a delayed change in voltage on account of their electrical properties. The converter tries to emulate this response with the assistance of the smoothing time. For the line to remain stable, all the energy generation units in a separate network have to respond in a similar manner during operation.		
r5420	Line droop control voltage droop output / Line drp U outp		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [Vrms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [Vrms]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [Vrms]
Description:	Displays the smoothed output voltage of the reactive current voltage droop. Droop formula (without smoothing): $p5420 = p5415 + p5416 + p5417 * r5421[0] / r0207 * p0210$		
Dependency:	Refer to: p5415		
r5421[0...1]	Line droop control voltage droop reactive current / Line drp U I_reac		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [A]	Calculated: - Dyn. index: - Units group: - Scaling: - Max - [A]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [A]
Description:	Displays the input reactive current of the reactive current voltage droop. The reactive current is calculated for the currents and voltages defined with connector inputs p5403 and p5404.		
Index:	[0] = Unsmoothed [1] = Smoothed		
Dependency:	Refer to: p5419		
Note:	The value is smoothed by a PT1 filter (p5419).		

r5422[0...1]	Line droop control voltage droop reactive power / Line drp U Q_reac		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [kvar]	- [kvar]	- [kvar]
Description:	Displays the input reactive power of the reactive current voltage droop. The reactive power is calculated for the currents and voltages defined with connector inputs p5403 and p5404.		
Index:	[0] = Unsmoothed [1] = Smoothed		
Dependency:	Refer to: p5419		
Note:	Re index 1: The value is smoothed using a PT1 filter (smoothing time: p0045).		

p5423	Line droop control supplementary inductance / Line drp L_suppl		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7982
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.000 [mH]	10.000 [mH]	0.000 [mH]
Description:	Sets an imaginary supplementary inductance for the infeed. The supplementary inductance supplements the effect of the voltage droop, in particular for transient operations.		
Dependency:	Refer to: p5424		
Warning:	Unsuitable supplementary inductance and smoothing time settings will make line droop control unstable.		
			
Note:	The supplementary inductance is de-activated with p5423 = 0. The converter's output voltage is calculated so that the converter behaves like a supplementary inductance and as such achieves an effect similar to a line reactor with higher/lower inductance. The supplementary inductance can be used for damping in the event of resonance phenomena on the line.		

p5424	Line droop control supplementary inductance smoothing time / L drp L_suppl t_sm		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T	Calculated: -	Access level: 4

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	100.00 [ms]	0.00 [ms]
Description:	Sets the smoothing time for the effect of the supplementary inductance (p5423).		
Dependency:	Refer to: p5423		
Note:	The supplementary inductance causes current change to be fed back to the converter's output voltage.		

p5425[0...1]	CI: Line droop control voltage control signal source / L drp U_ctrl s_sc		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: p2001 Max -	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting [0] 3468[0] [1] 3468[1]
Description:	Sets the signal source for the voltage to be regulated at the connection point in alpha/beta coordinates.		
Index:	[0] = Alpha [1] = Beta		
Dependency:	Refer to: p5427		
Note:	The following BICO interconnections are recommended: - Compensation of the internal voltage drop for connection point at line filter: BI: p5425 = r3468 - Compensation of the internal voltage drop for connection point at line transformer: BI: p5425 = r5488 or r5498		
p5426	Line droop control voltage control P gain / Line drp U_ctrl Kp		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 0.0 [%]
Description:	Sets the proportional gain for the controller for voltage control at the connection point. The controller compensates internal voltage drops under load conditions and as such precisely converts the droop characteristic at the connection point (defined in p5425).		
Dependency:	Refer to: p5427		
Note:	The proportional component of the controller is de-activated with p5426 = 0.		
p5427	Line droop control voltage control integration time / Line drp U_ctrl Ti		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.0 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 10000.0 [ms]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 500.0 [ms]
Description:	Sets the integration time for the controller for voltage control at the connection point. The controller compensates internal voltage drops under load conditions and as such precisely converts the droop characteristic at the connection point (defined in p5425).		
Dependency:	Refer to: p5426		
Note:	The integral component of the controller is de-activated with p5427 = 0.		

p5428[0...3]	Line droop control voltage control short circuit / Line drp U_ctrl sh		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100.00 [%]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 20.00 [%] [1] 0.00 [%] [2] 90.00 [%] [3] 2.00 [%]
Description:	Sets the parameters for rapid pre-control of the output voltage in the event of a voltage dip. The values relate to the voltage setpoint from the voltage droop (r5420). The voltage output by the converter is formed from the product of the voltage setpoint and the adaptation factor, which is calculated in rapid pre-control.		
Index:	[0] = Adaptation factor lower limit [1] = Adaptation factor increment current limit [2] = Adaptation factor increment voltage difference [3] = Adaptation factor increment increase		
Dependency:	Refer to: r5452		
Note:	Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller. Re index 0: Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The value is dependent upon the voltage drop at the line reactor when the current limit is reached. As such, the value results from the reactor inductance, the frequency, and the current limit. A value of 100% de-activates the function. Re index 1: When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. A value of 100% de-activates the function. Re index 2: If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller clock cycles, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle. Re index 3: If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller clock cycle (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of pre-control by means of multiplication by the droop setpoint r5420 is cancelled out.

Description:	Sets the gain for the DT1 element of the frequency droop. In addition or alternatively to fast droop (p5413, p5414), with this D component power oscillations in the island line can be dampened. The reference quantity is the gain of the regular frequency droop (p5407).		
Recommend.:	Typical setting values lie between 50% and 100%.		
Dependency:	Refer to: p5477		
Note:	With the setting value of 100%, a frequency change from the power-frequency droop, unscaled for the integration of the line angle becomes effective. With p5476 = 0, damping of the line control via the DT1 element is deactivated.

2.2 List of parameters

Note: The transformer magnetizing function is used in order to magnetize a line transformer to which the ALM is connected. The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate pre-charging transformer or for photovoltaic applications).
The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1
The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.
The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.
If value = 13:
On low-power systems it is advisable to reduce the excitation current p3415 for inductance identification (e.g. p3415[0] = p3415[1] = 5%).
To repeat a measurement p5480 must first be set to 1 and then reset to a value of 13 once the measurement has been taken.

Description:	Sets the primary rated voltage of the transformer.		
Index:	[0] = Supply transformer [1] = Island grid transformer		
Note:	Re index 0: Setting the rated primary voltage of the line transformer, at whose secondary the AIM and the ALM are connected. If there is a circuit breaker at the transformer primary side, then the transformer can be magnetized before closing this circuit breaker in order to avoid high inrush currents. The setting of this primary voltage and setting the device supply voltage (p0210) defines the transformer ratio. To magnetize the transformer, the voltage has to be measured at the line side of the circuit breaker. To do this, an additional VSM must be connected and parameterized using p0150[0] and following. The voltage actual values of this VSM are displayed in r5461[0] and r5462[0]. The voltages converted over to the transformer secondary side are displayed in r5488[3, 2]. Re index 1: Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker. The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio. To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the transformer secondary side can be displayed in r5488[3, 4, 5]. Dependency:	Refer to: p5480, p5492		
Notice:	Overmodulation (r0074 > 97 %) during the measurement as a result of an excessively low DC link voltage, can have a significant influence on the measurement result. A countermeasure, for example, can be to reduce the output voltage using p5494. The measurement result depends very strongly on precisely specifying the filter capacitance (p0221). When filter monitoring is active (p3678 > 0), the current measured values of the VSM (r3671, r3672) are used to identify the magnetizing inductance. Incorrect VSM measured values result in excessively high deviations when determining the magnetizing inductance.		
Note:	During identification, the value previously entered in p5492 is not effective.

Description:	Sets the magnetizing inductance of the supply transformer.		
Dependency:	Refer to: r5491		
Notice:	If possible, p5492 should be set based on the data on the transformer rating plate. If the magnetizing inductance is not specified, then an estimate can be made using the formula specified below (instead of r0206, the transformer rated power is used). The magnetizing inductance should be used as basis for setting the DC component controller (p5437).		

Note: The parameter is preset when selecting the power unit (p0201). In so doing, a transformer is assumed with the same power and with 2 % magnetizing current:
 $p5492 = r0206[0] / (3 * r0207[0] * r0207[0] * 2\% * 2\pi * p0211)$

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	External pre-charging bypass contactor	Yes	No	-
	01	Island grid circuit breaker	Yes	No	-

Dependency: Refer to: r0863, r3402

Caution: Re bit 01:

Without any additional control logic, the signal is not suitable to control the island grid circuit breaker.

The signal only represents an enable signal to close the circuit breaker during the actual synchronization (r5499.5 = 1). For r5499.5 = 0, generally the following applies r5493.1 = 0.

Note: Re bit 00:

The signal is used to control the external bridging contactor in the pre-charging circuit.

The external bridging contactor is closed if pre-charging is complete (r3402 > 5) and the circuit breaker has not been activated (r0863.1 = 0).

Re bit 01:

The signal is used to control the circuit breaker between the island grid and the external grid.

The signal is set to 1, if the island grid was successfully synchronized. In this case, the conditions for synchronization (frequency, amplitude, phase angle, p5586) are maintained.

Dependency:

Refer to: p5507, r5510, p5520

Note:

Re bit 00:

If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint.

$r0075 = p3610 + p3611 + r3471 + r5510[0]$.

If p5500.0 = 1 the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (p5502.1 = 1). In this case, the following applies:

$r0075 = p3610 + r3471 + r5510[0]$

Re bit 01:

Only active for p5500.3 = 0.

If p5500.1 = 0 the alpha and beta amplitudes of the line voltage, which were smoothed with p5507[2], are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint (r5510) is prevented.

If p5500.1 = 1, the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with p5507[3].

Re bit 02:

Only effective if p5500.1 = 0 and p5500.3 = 0.

If p5500.2 = 0, the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint (r5510) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced.

If p5500.2 = 1, the mean value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic.

Re bit 03:

For p5500.3 = 0, no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical.

For p5500.3 = 1, for an unsymmetrical line supply voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage dissymmetry and therefore supports the grid.

The negative phase-sequence system current is impressed using the negative phase-sequence system controller (p3636 and following).

The negative phase-sequence system controller is automatically activated and deactivated (the following applies, p3636.0 = p5500.3).

Re bit 04:

Only active for p5500.3 = 1.

For p5500.4 = 0, a negative phase-sequence system current setpoint according to the characteristic p5505/p5506 is generated, if the difference between two line phase voltage amplitude is greater than p5509[8] and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic.

For p5500.4 = 1, an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than p5509[9].

Re bit 05:

For p5500.5 = 1, the limiting of the support reactive current is not active according to the characteristic p5505/p5506. Instead, the current limits p5506[1] und p5506[3] are effective after adding the supplementary reactive current setpoints p3610 and p3611.

Re bit 06:

For p5500.6 = 1, the apparent current is limited to the smoothed apparent current (r0027) effective at the start of an FRT. During this line fault, this value of the apparent current limit is continually effective.

Re bit 07:

Only effective for p5526.7 = 1 and for p192.19 = 1

For p5500.7 = 1, for each phase, a tolerance band is generated around the current setpoint, which the current actual value does not leave.

For p5500.7 = 0, a tolerance band is generated based on the current setpoint amplitude. The current actual value for each phase can be within this tolerance band.

2 Parameters

2.2 List of parameters

Re bit 08:

Only active for p5500.3 = 1.

For p5500.8 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current is reduced to zero.

For p5500.8 = 0, during a line short circuit (r5502.4 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

Re bit 09:

Only active for p5500.3 = 1.

For p5500.9 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current and the supporting reactive current are reduced to zero.

For p5500.9 = 0, the standard response of dynamic line support applies corresponding to p5500.8 = 0.

Description: Sets the signal source to activate dynamic grid support.

BI: p5501 = 1 signal:

Activates dynamic grid support.

BI: p5501 = 0 signal:

De-activates dynamic grid support.

Recommend.: The smoothing time for the line PLL (p3458[1]) should be set to values higher than 20 ms so as to ensure stable operation even with sharp dips in supply voltage.

Notice: Dynamic grid support can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1).

Note: If grid support is de-activated:
Line disturbance will generate the standard response to phase failures on the part of the infeed for drive applications (see A06205).
If grid support has been activated:
Line disturbance will trigger grid support in accordance with the set characteristic (p5505, p5506).

Dependency: Refer to: p5500

Note: Re index 0:

Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).

Re index 1:

Minimum time for line disturbance for the start of grid support in accordance with the characteristic.

If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

Re index 2:

Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0. An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.

A smoothing time of less than a line period makes no sense.

If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.

Re index 3:

Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.

The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support. For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value. For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.</p>

Re index 10:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

Re index 11:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for dynamic grid support (as a percentage of the converter maximum current r0209).

2.2 List of parameters

05	FRT shutdown delayed	Yes	No	-

Dependency:

Refer to: p5541

Note:

AISL: Anti Islanding

FRT: Fault Ride Through (riding through a line fault)

Re bit 00:

The monitoring bandwidths of the voltage and frequency criteria are defined using the thresholds p5543 and p5544 (also see the note regarding bit 5).

Re bit 01:

The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.

Re bit 04:

It is only possible to activate the FRT voltage time characteristic (HVRT, LVRT) when the voltage and frequency monitoring are activated (p5540.0 = 1 signal). The monitoring thresholds p5543 and p5544 are deactivated.

Re bit 05:

The behavior after an LVRT limit has been exceeded depends on the signal state.

0 signal = immediate shutdown.

1 signal = shutdown only after the time in p5545[2] has expired.

Re bit 07:

It is only possible to activate the frequency time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1 signal). The monitoring thresholds p5543 and p5544 are deactivated.

Re bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3] and the system waits until these limits are maintained. If the voltage and frequency limits are exceeded, then this is displayed in r5542.

Description: Sets the signal source for the voltage to be measured in alpha/beta coordinates.

Index: [0] = Alpha
[1] = Beta

Note: PLL2 is deactivated with input signal 0.

The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):

- The voltage of the island grid is measured using a VSM (r5461[0] and r5462[0]), which is connected in front of the circuit breaker between the island grid and the ALM.
- The voltage of the external grid is measured using another VSM (r5461[1] and r5462[1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

Description: Sets the mode for the black start.

An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.

Prerequisite:

The ALM function module "line droop control" and line droop operation (p5401) are activated.

If value = 0:

The black start is deactivated.

If value = 2:

At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.

If value = 3:

At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switch-on operation is carried out with synchronization to the existing grid voltage.

If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

2 Parameters

2.2 List of parameters

Value:	0: Deactivated 2: Grid black start completed 3: Grid black start automatic
Notice:	A black start is only possible when the grid droop control (p5401) is activated. A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1). The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).
Note:	Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly. In order to avoid the high inrush currents, when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function. The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero.

Description:

Display and connector output of the supplementary setpoints for the frequency and voltage control during island grid synchronization.

Index:

[0] = Setpoint ramp frequency
[1] = Setpoint ramp voltage

Notice:

In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.

In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!

The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

Note:

In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.

The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

Description:

Sets the signal sources for island grid synchronization.

Using the island grid synchronization function, an island grid can be synchronized with an external grid regarding frequency, phase angle and voltage amplitude.

After synchronization has been performed, a circuit breaker between the two grids can be closed (r5493.1).

Index:

[0] = Start
[1] = Circuit breaker feedback signal
[2] = Reset setpoints

2 Parameters

2.2 List of parameters

Notice: Re index 1:
The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1].
The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p0860 and following).

Note: In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation!
This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.

Re index 0:
Signal source for the start command to synchronize the island grid with an external grid.
The target values for the synchronization, are the output values of the PLL2 (r6311[1], r6313, r6314).
The PLL2 must be activated at the latest when synchronization starts (p5571, p5574).

Re index 1:
Signal source for the feedback signal of the circuit breaker between the island grid and the external grid.

Re index 2:
Signal source to reset the supplementary setpoints for voltage and frequency(r5582[0, 1]) after island grid synchronization has been completed.
At the same time as the reset command, the external cyclic supplementary setpoints (p5406[0], p5416[0]) must be appropriately adapted.

	-180.00 [°]	179.90 [°]	0.00 [°]	
Description:	Sets the phase shift between the synchronizing voltage measured by the Voltage Sensing Module (VSM) and the actual drive converter input voltage.			
Index:	[0] = Supply transformer [1] = Island grid transformer			
Warning:	Switching-in with a significantly incorrectly parameterized offset angle (> 5 °) can cause a peak current intervention and / or triggering the crowbar thyristor.			
				
Caution:	If this parameter is changed in the "ready for operation" state and if a synchronizing voltage is already available at the VSM, under certain circumstances, a line supply fault can be signaled. When this occurs for the first time after changing the parameter, the fault can be ignored and acknowledged.			
				
Note:	This phase shift must be determined when commissioning the system. Example: If the converter input voltage (= secondary side voltage of the power transformer) lags the synchronizing voltage measured by the VSM by 30 °, then p6420 should be set to -30°.

Description:	Setting to reverse the rotating field direction of the synchronizing voltage system measured by the Voltage Sensing Module (VSM).			
Value:	0: Rotating field direction positive 1: Rotating field negative			
Warning:	Only use in an emergency if it is not possible to correct the wiring. Extreme caution must be applied in this case when measuring the phase shift (p6420).			
				
Note:	Allows the rotating field direction to be adapted if there is inconsistency in the wiring.

Description:	Displays the phase shift between the primary and secondary voltages of the line transformer identified by automatic transformer identification (p5480 = 12).		
Dependency:	Refer to: p5480, p6420		
Note:	The phase shift relates to the primary side of the transformer, which is connected to the line. The secondary side is connected to the infeed. Example: A Dy5n transformer has a phase shift of $-5 \times 30^\circ = -150^\circ$. This means that the secondary voltage is shifted from the primary voltage by -150° , the primary voltage leads by 150° . The result should be entered into p6420. Description:	Setting to parameterize the recorder. The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms, the variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card. The development and system test departments have the software necessary to decode the content.		
Index:	[0] = Enable [1] = Recording time [2] = Pre-trigger time [3] = Output message [4] = Recording factor		
Note:	Re index [0]: Enables or disables the function. p6999[0] = 0 inhibit the function. p6999[0] = 1 enable the function. A POWER ON is required after the enable. Re index [1]: Sets the recording time, [ms]. The value is discretized with the current controller sampling time. Re index [2]: Sets the pretrigger time, [ms]. This time is included in the recording time and cannot be longer than the recording time p6999[1]. The value is discretized with the current controller sampling time. Re index [3]: Enables or disables the output of message A49998 when the trigger event is triggered. Re index [4]: p6999[4] = n, n = 0 ...4 Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2 ⁿ times, and reduces the number of signals 2 ⁿ times. Example: p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4 --> recording time: 2000 ms * 2 ⁴ = 32 s, pre-trigger time: 1000 ms * 2 ⁴ = 16 s, number of signals 128/16 = 8. When setting p6999[4] to 0, the results are as follows: --> recording time: 2000 ms, pre-trigger time: 1000 ms, number signals 128. The maximum number of signals depends on the drive object.

- Note:**
- Re p7003 = 0:
- the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352.
 - the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1).
 - individual Motor Modules can be activated and de-activated (p7001).
- Re p7003 = 1, 2:
- the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352).
 - all Motor Modules are activated. It is not possible to de-activate a Motor Module.

VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 0.00000 [ohm]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Units group: - Scaling: - Max 200.00000 [ohm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00000 [ohm]
Description:	Sets the proportional gain for the circulating current controller. The parameter is pre-set to the cable resistance.		
p7037	Infeed par_cct circulating current control integral time / I_circ Tn		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100000.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [%]
Description:	Sets the scaled integral time of the circulating current controller.		
Note:	A value of 100 % corresponds to the basic setting derived from the controller sampling time p0115[0]. The integral component of the controller is de-activated with p7037 = 0.		
p7037[0...n]	Par_circuit circulating current control integral time / I_circ Tn		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 2.0	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Units group: - Scaling: - Max 1000.0	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4.0
Description:	Sets the integral time of the circulating current controller. The parameter is referred to the current controller sampling time (p0115[0]).		
Dependency:	Refer to: p0115		
p7038	Infeed par_circuit circulating current control limit / I_circ limit		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 1 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100 [%]
Description:	Sets the limit of the circulating current controller output values. The parameter is, depending on the phase, referred to the valve lockout times (p1828, p1829, p1830).		
p7038[0...n]	Par_circuit circulating current control limit / I_circ limit		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 1 [%]	Calculated: CALC_MOD_ALL Dyn. index: DDS, p0180 Units group: - Scaling: - Max 100 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 50 [%]
Description:	Sets the limit of the circulating current controller output values. The parameter is, depending on the phase, referred to the valve lockout times (p1828, p1829, p1830).		

p7040[0...n]	Par_circuit correction valve lockout time phase U / Comp t_lockout U		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [µs]	Calculated: - Dyn. index: PDS, p0120 Units group: - Scaling: - Max 1000000.00 [µs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [µs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase U (p1828). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1828		
p7042[0...n]	Par_circuit correction valve lockout time phase V / Comp t_lockout V		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [µs]	Calculated: - Dyn. index: PDS, p0120 Units group: - Scaling: - Max 1000000.00 [µs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [µs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase V (p1829). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1829		
p7044[0...n]	Par_circuit correction valve lockout time phase W / Comp t_lockout W		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [µs]	Calculated: - Dyn. index: PDS, p0120 Units group: - Scaling: - Max 1000000.00 [µs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [µs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase W (p1830). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1830		
r7050[0...n]	Par_circuit circulating current phase U / Circ_I_phase U		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [A]	Calculated: - Dyn. index: PDS, p0120 Units group: 6_5 Scaling: p2002 Max - [A]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [A]
Description:	Displays the circulating current of phase U as peak value.

2.2 List of parameters

r7051[0...n]	Par_circuit circulating current phase V / Circ_I_phase V			
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [A]	Calculated: - Dyn. index: PDS, p0120 Units group: 6_5 Scaling: p2002 Max - [A]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [A]	
Description:	Displays the circulating current of phase V as peak value.			
r7052[0...n]	Par_circuit circulating current phase W / Circ_I_phase W			
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [A]	Calculated: - Dyn. index: PDS, p0120 Units group: 6_5 Scaling: p2002 Max - [A]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [A]	
Description:	Displays the circulating current of phase W as peak value.			
r7100[0...99]	Par_circuit ring buffer fault/alarm code / Fault/alarm code			
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: Unsigned32 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Ring buffer for faults and alarms that have occurred from power units connected in parallel (Motor Module, Active Line Infeed, Voltage Sensing Module). Displays the fault/alarm code.			
Dependency:	Refer to: r7101, r7102, r7103			
Note:	The last fault case that occurred is documented in index 0. The parameter is reset to 0 at POWER ON.			
r7101[0...99]	Par_circuit ring buffer data set number / Ring buffer Ds_no			
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: Unsigned32 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Ring buffer for faults and alarms that have occurred from power units connected in parallel (Motor Module, Active Line Infeed, Voltage Sensing Module). p7101 < 100: Displays the Power unit Data Set number (PDS). p7101 >= 100: Displays the Voltage Sensing Module Data Set number (VSMDS)			
Dependency:	Refer to: r7100, r7102, r7103			
Note:	The last fault case that occurred is documented in index 0. The parameter is reset to 0 at POWER ON.			

r7102[0...99]	Par_circuit ring buffer fault/alarm received / F/A received		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: Unsigned32 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Ring buffer for faults and alarms that have occurred from power units connected in parallel (Motor Module, Active Line Infeed, Voltage Sensing Module). Displays the relative system runtime when the fault or alarm occurred.		
Dependency:	Refer to: r7100, r7101, r7103		
Note:	The last fault case that occurred is documented in index 0. The parameter is reset to 0 at POWER ON.		
r7103[0...99]	Par_circuit ring buffer fault/alarm gone / F/A gone		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: Unsigned32 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Ring buffer for faults and alarms that have occurred from power units connected in parallel (Motor Module, Active Line Infeed, Voltage Sensing Module). Displays the relative system runtime when the fault or alarm was withdrawn.		
Dependency:	Refer to: r7100, r7101, r7102		
Note:	The last fault case that occurred is documented in index 0. The parameter is reset to 0 at POWER ON.		
r7200[0...n]	Par_circuit power unit overload I2t / PU overload I2t		
A_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [%]	Calculated: - Dyn. index: PDS, p0120 Units group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the overload of the particular power unit in a parallel circuit configuration calculated using the I2t function. The maximum value of all power units is displayed in r0036.		
r7201[0...n]	CO: Par_circuit power unit temperatures max. inverter / PU temp max inv		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
Description:	Displays the maximum inverter temperature in the power unit for a parallel circuit configuration. The maximum value of all power units is displayed in r0037[0].		

2 Parameters

2.2 List of parameters

r7202[0...n] Par_circuit power unit temperatures max. depletion layer / PU TempMaxDepLayer

A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
---	--	--	--

Description: Displays the maximum depletion layer temperature in the power unit for a parallel circuit configuration. The maximum value of all power units is displayed in r0037[1].

r7203[0...n] CO: Par_circuit power unit temperatures max. rectifier / PU temp max rect

A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
---	--	--	--

Description: Displays the maximum rectifier temperature in the power unit for a parallel circuit configuration. The maximum value of all power units is displayed in r0037[2].

r7204[0...n] CO: Par_circuit power unit temperatures air intake / PU temp air intake

A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
---	--	--	--

Description: Displays the air intake temperature in the power unit for a parallel circuit configuration. The maximum value of all power units is displayed in r0037[3].

r7205[0...n] Par_circuit power unit temperatures electronics / PU temp electr

A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
---	--	--	--

Description: Displays the temperature of the electronics module in the power unit for a parallel circuit configuration. The maximum value of all power units is displayed in r0037[4].

r7206[0...n]	Par_circuit power unit temperatures inverter 1 / PU temp inv 1		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 1 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[5].

r7207[0...n]	Par_circuit power unit temperatures inverter 2 / PU temp inv 2		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 2 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[6].

r7208[0...n]	Par_circuit power unit temperatures inverter 3 / PU temp inv 3		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 3 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[7].

r7209[0...n]	Par_circuit power unit temperatures inverter 4 / PU temp inv 4		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 4 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[8].

r7210[0...n]	Par_circuit power unit temperatures inverter 5 / PU temp inv 5		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 5 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[9].

r7211[0...n]	Par_circuit power unit temperatures inverter 6 / PU temp inv 6		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays the inverter temperature 6 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[10].

r7212[0...n]	Par_circuit power unit temperatures inverter 1 / PU temp rect 1		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays rectifier temperature 1 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[11].

r7213[0...n]	Par_circuit power unit temperatures inverter 2 / PU temp rect 2		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays rectifier temperature 2 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[12].

r7214[0...n]	Par_circuit power unit temperatures depletion layer 1 / PU temp DepLayer 1		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays depletion layer temperature 1 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[13].

r7215[0...n]	Par_circuit power unit temperatures depletion layer 2 / PU temp DepLayer 2		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays depletion layer temperature 2 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[14].

r7216[0...n]	Par_circuit power unit temperatures depletion layer 3 / PU temp DepLayer 3		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays depletion layer temperature 3 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[15].

r7217[0...n]	Par_circuit power unit temperatures depletion layer 4 / PU temp DepLayer 4		
A_INF (Parallel), B_INF (Parallel), R_INF (Parallel), S_INF (Parallel), VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: PDS, p0120 Units group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]

Description: Displays depletion layer temperature 4 in the power unit for a parallel circuit configuration.
The maximum value of all power units is displayed in r0037[16].

Description:	Displays the status of power cycling counter for valve 1. For repairs, this parameter serves as internal documentation for service personnel. The counter state corresponds to the valve wear. A maximum of 650% of the specified service life is displayed. 10000 corresponds to the nominal service life (100%). When this value is reached, the IGBT is theoretically at the end of its service life and must be replaced.		
Dependency:	Refer to: p7786		
Notice:	After a valve has been replaced, the corresponding power cycling counter must be reset.		
Note:	The IGBT power cycling counter can only be set to 0. Procedure when replacing valve 1: 1. Switch off the system and replace valve 1. 2. Switch on the system and acknowledge that valve 1 has been replaced (p7786.1 = 1). --> the power cycling counter of valve 1 is reset (r7740 = 0). 3. Description: Displays the status of power cycling counter for valve 3.
 For repairs, this parameter serves as internal documentation for service personnel.
 The counter state corresponds to the valve wear. A maximum of 650% of the specified service life is displayed.
 10000 corresponds to the nominal service life (100%). When this value is reached, the IGBT is theoretically at the end of its service life and must be replaced.

Dependency: Refer to: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.

Procedure when replacing valve 3:
 1. Switch off the system and replace valve 3.
 2. Switch on the system and acknowledge that valve 3 has been replaced (p7786.3 = 1).
 --> the power cycling counter of valve 3 is reset (r7742 = 0).
 3. Carry out a POWER ON (power off/on).
 --> as a consequence p7786.3 is automatically set to 0.

2 Parameters

2.2 List of parameters

Re bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

Re bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

Re bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

Re bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and p7765 bit 00 is set.

Re bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and in p7765 bit 01 is set and not bit 00.

Re bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and in p7765.2 is set.

3: Reset

Notice:

After action p7770 = 1 no more pulses may be enabled.
After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.

Note:

If value = 1:
This action loads the NVRAM data to the parameters.
If value = 2:
This action loads the parameters to the NVRAM.
If value = 3:
This action sets parameters p7771 ... p7774 to the factory setting.
It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

A_INF, B_INF, R_INF (Parallel), S_INF, SERVO, SERVO_I_AC, VECTOR, VECTOR_I_AC	Can be changed: U, T Data type: Integer16 P-Group: Converter Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 9	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 2 [1] 3 [2] 4 [3] 7 [4] 8 [5] 9 [6] 5 [7] 0 [8] 6 [9] 1 [10...15] 0
Description:	Sets the individual signals for the component trace. For p7790[0...15] = 0, the component trace is deactivated. Re index 0 ... 7: The signals are set in p7790[0...7], whose characteristic is to be recorded over time. If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased. Re index 8 ... 15: The signals are set in p7790[8...15], whose instantaneous value is to be recorded.		
Value:	0: No signal 1: Pulse frequency 2: Phase current U 3: Phase current V 4: Phase current W 5: IGBT chip temperature 6: Heat sink temperature 7: DC link voltage 8: Modulat_depth 9: Angle		
Index:	[0] = Trace channel 0 [1] = Trace channel 1 [2] = Trace channel 2 [3] = Trace channel 3 [4] = Trace channel 4 [5] = Trace channel 5 [6] = Trace channel 6 [7] = Trace channel 7 [8] = Trace channel 8 [9] = Trace channel 9 [10] = Trace channel 10 [11] = Trace channel 11 [12] = Trace channel 12 [13] = Trace channel 13 [14] = Trace channel 14 [15] = Trace channel 15		
Dependency:	Refer to: p7791, p7792		
Note:	In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data are overwritten after more than 5 trigger events. The trigger event can be set in p7791. By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.		

p7791	Component trace trigger / Comp trace trigger		
A_INF, B_INF, R_INF (Parallel), S_INF, SERVO, SERVO_I_AC, VECTOR, VECTOR_I_AC	Can be changed: U, T Data type: Integer16 P-Group: Converter Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the trigger event for the component trace.		
Value:	0: Overcurrent, overvoltage, ground fault, Uce 1: Time-critical message 2: Uce		
Dependency:	Refer to: p7790, p7792		
Note:	When the power unit detects an overcurrent condition, then A30001 is output. When the power unit detects an overvoltage condition in the DC link, then A30002 is output. When the power unit detects a ground fault, then A30021 is output. When the power unit detects a Uce fault, then A30022 is output.		
p7792	Upload component trace data / Upload comp trace		
A_INF, B_INF, R_INF (Parallel), S_INF, SERVO, SERVO_I_AC, VECTOR, VECTOR_I_AC	Can be changed: U, T Data type: Integer16 P-Group: Converter Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to upload and save the trace data of the component trace. Experts can then evaluate this data. For p7792 = 1, the trace data of the component is written to files on the memory card in a non-volatile fashion. The parameter is then automatically set to zero.		
Value:	0: Inactive 1: Upload and save active		
Dependency:	Refer to: p7790, p7791		
Notice:	Trace files of this component already available on the non-volatile storage medium are overwritten after backup has been activated.

Description: Sets the behavior for the automatic firmware update of the DRIVE-CLiQ components.

Value:
0: Deactivated
1: Upgrade and downgrade
2: Upgrade

Notice: If this parameter is changed, it only becomes effective the next time that the drive system boots.

Note: The firmware is automatically updated when the system boots. The boot can take several minutes. After the update has been completed, it is necessary to carry out a new POWER ON (power-down/power-up) for the components involved.
The firmware update procedure is displayed as follows:
Control Unit (LED RDY):
Flashes yellow with 0.5 Hz --> firmware is being updated.
Flashing yellow with 2 Hz --> POWER ON is required for the components involved.
Components involved:
Flashing red/green with 0.5 Hz --> firmware is being updated.
Flashing red/green with 2 Hz --> POWER ON of the components is required.
Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

Description:	Activating the firmware download for the DRIVE-CLiQ components specified in p7828. 1: Activate download. -1: activate the download and carry out a reset. 0: Download successfully completed. > 1: Fault code 011: DRIVE-CLiQ component has detected a checksum error. 015: The selected DRIVE-CLiQ components did not accept the contents of the firmware file. 018: Firmware version is too old and is not accepted by the component. 019: Firmware version is not suitable for the hardware release of the component. 101: After several communication attempts, no response from the DRIVE-CLiQ component. 140: Firmware file for the DRIVE-CLiQ component not available on the memory card/device memory. 143: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware. 144: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card/device memory is defective. 145: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time. 156: Component with the specified component number is not available. Additional values: Only for internal Siemens troubleshooting.		
Dependency:	Refer to: p7828		
Note:	p7829 is automatically set to 0 after the firmware has been successfully downloaded. The new firmware only becomes active at the next system run-up.

	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the actual serial number of the memory card. The individual characters of the serial number are displayed in the ASCII code in the indices.		
Dependency:	Refer to: p9920, p9921		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.		
Note:	Example: displaying the serial number for a memory card: r7843[0] = 49 dec --> ASCII characters = "1" --> serial number, character 1 r7843[1] = 49 dec --> ASCII characters = "1" --> serial number, character 2 r7843[2] = 49 dec --> ASCII characters = "1" --> serial number, character 3 r7843[3] = 57 dec --> ASCII characters = "9" --> serial number, character 4 r7843[4] = 50 dec --> ASCII characters = "2" --> serial number, character 5 r7843[5] = 51 dec --> ASCII characters = "3" --> serial number, character 6 r7843[6] = 69 dec --> ASCII characters = "E" --> serial number, character 7 r7843[7] = 0 dec --> ASCII characters = " " --> serial number, character 8 ... r7843[19] = 0 dec --> ASCII characters = " " --> serial number, character 20 r7843[20] = 0 dec Serial number = 111923E

	Min	Max	Factory setting
	-	-	-
Description:	Displays the version of the firmware stored on the memory medium of the drive device. Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.		
Index:	[0] = Internal [1] = External [2] = Parameter backup		
Note:	Re index 0: Displays the internal firmware version (e.g. 04402315). This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions. Re index 1: Displays the external firmware version (e.g. 04040000 -> 4.4). For automation systems with SINAMICS Integrated this is the runtime version of the automation system. Re index 2: Displays the internal firmware version of the parameter backup. With this CU firmware version, the parameter backup was saved, which was used when powering up.

Description: Displays the number of indices for r7853[0...n].
This corresponds to the number of DRIVE-CLiQ components that are in the target topology.

Dependency: Refer to: r7853

Note: The values are valid if all available Control Units adopt the "Initialization finished" state (r3988 = 800) following power-up.

2.2 List of parameters

p7857	Sub-boot mode / Sub-boot mode		
A_INF, B_INF, CU_LINK, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the mode for the sub-boot.		
Value:	0: Sub-boot manual 1: Sub-boot automatic		
Note:	For p7857 = 0 (manual sub-boot) the following applies: The parameter should be set to 1 to start the sub-boot.

p7859[0...199]	Component number global / Comp_no global		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min -32786	Calculated: - Dyn. index: - Units group: - Scaling: - Max 32767	Access level: 4 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the global and unique component number in a drive system with several Control Units. Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit. The indices are allocated to the global component numbers as follows: p7859[0]: Not used p7859[1]: Sets the global component number for the local component number 1 p7859[2]: Sets the global component number for the local component number 2 ... p7859[199]: Sets the global component number for the local component number 199		
Notice:	This parameter is preferably set via suitable commissioning software (e.g. UpdateAgent, STARTER, SCOUT). Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.		
Note:	The parameter is not influenced by setting the factory setting.

Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - The drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - If they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.

	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Sets the life guarding parameter for the following CANopen objects: - 100C hex: Guard Time - 100D hex: Life Time Factor The life time is derived by multiplying guard time by the life time factor.		
Index:	[0] = Time interval [ms] for the life time [1] = Factor for the lifetime		
Dependency:	Refer to: p8606		
Note:	For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated. The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is deactivated (p8606 = 0).

Note:	The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer. For SINAMICS S120 with CBC10, the PZD interface IF2 is used: BI: p0840.0 = r889x.0 BI: p0844.0 = r889x.1 BI: p0848.0 = r889x.2 BI: p0852.0 = r889x.3 BI: p2103.0 = r889x.7 For SINAMICS S110, the PZD interface IF1 is used: BI: p0840.0 = r209x.0 BI: p0844.0 = r209x.1 BI: p0848.0 = r209x.2 BI: p0852.0 = r209x.3 BI: p2103.0 = r209x.7 The write access is rejected if a CANopen control word is not mapped at one of these locations. This also causes the project download of the commissioning software to be canceled.

Description: Parameters for the PROFINET data set "Identification and Maintenance 4" (I&M 4).
This information is known as "Signature".

Dependency: This parameter is preassigned as standard (see note).
After writing information to p8809, p8805 is automatically set to = 1.
Refer to: p8805

Note: For p8805 = 0 (factory setting) the following applies:
Parameter p8809 contains the information described below.
Re p8809[0...3]:
Contains the value from r9781[0] "SI change tracking checksum functional".
Re p8809[4...7]:

Description: Project selection for SINAMICS Link.

Value: 16: SINAMICS Link project 16 participants
64: SINAMICS Link project 64 participants

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
The parameter must be set the same for all participants.
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.

p8812[0...1]	SINAMICS Link settings / SINAMICS Link cl c		
CU_S120_DP (PROFINET CBE20), CU_S120_PN (PROFINET CBE20), CU_S150_DP (PROFINET CBE20), CU_S150_PN (PROFINET CBE20)	Can be changed: C1(1) Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 2000	Access level: 3 Func. diagram: 2198 Unit selection: - Expert list: 1 Factory setting [0] 1 [1] 2000

Description: Sets the clock cycle for SINAMICS Link.
Re index 0:
0 = clock synchronous mode not activated, 1 = clock synchronous mode activated
Re index 1:
Possible values: 500, 1000, 2000 µs

Index: [0] = Activate isochronous mode
[1] = Bus CC [µs]

Dependency: Refer to: p8811

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.
Re index 0:
Is applicable for the synchronization of the application. The SINAMICS Link itself is always synchronous.
Re index 1:
The value must be set the same for all participants.
When newly selecting the project p8811, p8812[1] is set to the factory setting.
For p8811 = 16, the following applies:
Min/max/factory setting: 500/500/500 µs
For p8811 = 64, the following applies:
Min/max/factory setting: 1000/2000/2000 µs

p8815[0...1] IF1/IF2 PZD functionality selection / IF1/IF2 PZD fct

CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: C1(1)	Calculated: -	Access level: 3

	P-Group: Communications	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2	1

Description: Selects the PZD interface for the clock cycle synchronization functionality and PROFIsafe.

Value: 1: Interface 1 (IF1)
2: Interface 2 (IF2)

Index: [0] = Isochronous mode
[1] = PROFIsafe

Dependency: Refer to: p8839

Note: A change only becomes effective after POWER ON, reset or project download.
Example:
p8815[0] = 1: IF1 supports the isochronous mode.
p8815[1] = 2: IF2 supports PROFIsafe.

p8829 CBE2x remote controller number / CBE2x rem ctrl num

CU_S120_DP (PROFINET CBE20, PROFINET CBE25), CU_S120_PN (PROFINET CBE20, PROFINET CBE25), CU_S150_DP (PROFINET CBE20, PROFINET CBE25), CU_S150_PN (PROFINET CBE20, PROFINET CBE25)	Can be changed: C1(1)	Calculated: -	Access level: 3

	Min	Max	Factory setting
	1	2	1

Description: Sets the number of remote controllers expected for PROFINET CBE20/CBE25.
The "Shared Device" functionality is activated with a value = 2.
The drive is being accessed by two PROFINET controllers simultaneously:
- automation controller (SIMOTION or SIMATIC A-CPU).
- safety controller (SIMATIC F-CPU).

Value: 1: Automation or Safety
2: Automation and Safety

2 Parameters

2.2 List of parameters

Notice: The F CPU may only use PROFIsafe telegrams.
The A CPU must be connected to enable the F CPU to gain access.
Set the value = 1 to commission the F CPU individually.

Note: A change only becomes effective after a POWER ON.

Description: Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20).
p8836 = 0: SINAMICS Link de-activated
p8836 = 1 ... 64: SINAMICS Link node address

Dependency: Refer to: p8835

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.
