Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".
Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value: 0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommend.: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

Description:	Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).		
Value:	0: Inactive 1: Control Unit onboard 2: COMM BOARD 99: Automatic		
Index:	[0] = Interface 1 [1] = Interface 2		
Dependency:	Refer to: p2030, p8815		
Note:	For value = 99 (automatic) the following applies: - if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1. - if a CBE20 is inserted, then the following applies: -- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2. -- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2. - CAN CBC10 always communicates via IF2. For a value not equal to 99 (automatic) the following applies: - both indices must be set to a number not equal to 99 (automatic). A change only becomes effective after POWER ON, reset or download.

Description:	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.		
Note:	This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus. Value = 0: Monitoring is de-activated.

2.2 List of parameters

Note: Re p8925 = 1:
The interface configuration (p8920 and following) is activated.
Re p8925 = 2:
The interface configuration (p8920 and following) is activated and saved to non-volatile memory.
Re p8925 = 3:
Restores all memory locations for the interface configuration to the factory settings.
The factory settings for the interface configuration are loaded on activation (p8925 = 1) or at the next POWER ON.

Description:	Sets the modulo value in degrees for rotary axes of the "Safe position" function. This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled. The value should be set, so that it is precisely at 2 ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump. The modulo function is deactivated for a value = 0.			
Notice:	When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output. Description:

Sets the function configuration for the safe motion monitoring functions.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Extended message acknowledgement	Yes	No	-
01	Setpoint velocity limit for STOP F	No	Yes	-
02	Actual value sensing sensorless motor type	Synchronous motor	Induction motor	-

05	Actual value sensing sensorless edge modulation	Yes	No	-
06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-

Notice:

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note:

Re bit 00:

When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.

Re bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

Re bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for an induction motor.

For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

Re bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

Re bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

Re bit 06:

When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10146.

	Re bit 05: This bit defines the type of modulation, which the sensorless actual value sensing evaluates. For bit = 0, the actual velocity is calculated for space vector modulation. For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

2 Parameters

2.2 List of parameters

- Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.
Re bit 00:
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.
- Note:** SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)
Re bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
Re bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

p9311 SI Motion actual value sensing clock cycle (Motor Module) / SI Mtn act clk MM

	Min	Max	Factory setting
	0.0000 [µs]	25000.0000 [µs]	0.0000 [µs]

- Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- The isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: Refer to: p0115, p9300, p9511

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

- Note:** The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).
The monitoring clock cycle from p9300 must be an integer multiple of this parameter.
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
The clock cycle time of the actual value sensing should not be set to more than 8 ms.
A change only becomes effective after a POWER ON.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [µs]	Max 100000.00 [µs]	Factory setting 0.00 [µs]

Description: Sets the filter time for the SSM feedback signal to detect standstill.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The filter time is effective only if the function is enabled (p9301.16 = p9501.16 = 1).

The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

The parameter is included in the crosswise data comparison of the two monitoring channels.

Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C30711 with value 7001 is output and safety stop response STOP F.

Description: Sets the monitoring time to define the brake ramp.
The rate of rise of the brake ramp depends upon p9381 (reference value) and p9383 (monitoring time).

Dependency: Refer to: p9381, p9382

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1	4	-1

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.
A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.
An increase is advantageous, if the current or voltage at the motor become small.

Dependency: Refer to: p9507

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Reducing this value can adversely affect the actual value sensing and the plausibility check.
When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For synchronous motors, the value 4 must be set.

If value = -1:

- for synchronous motors, the calculation is automatically made with the value 4.

- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

	5.00 [ms]	1000.00 [ms]	100.00 [ms]	
Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).			
Caution:	The safety functionality is only completely guaranteed after this time has expired.			
				
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.			
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

	0.00 [µs]	100000.00 [µs]	25000.00 [µs]	
Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. A longer filter time results in a longer response time.			
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9387 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

	0.00 [%]	1000.00 [%]	10.00 [%]	
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - The value must be increased if C30711 has occurred with message value 1042. - The value must be decreased if C30711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: $ p0305 \times p9783 \geq p9388 \times 1.2$			
Recommend.:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.			
Dependency:	Refer to: r9785			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.			
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - The value must be increased if C30711 with message value 1043 has occurred. - The value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
Recommend.:	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.		
Dependency:	Refer to: r9784		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9389 = maximum value, the filter is deactivated. Diagnostics parameter p9784 must be used to correctly set this parameter.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [°]	737280 [°]	0 [°]

Description:

Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set, so that it is precisely at 2ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency:

Refer to: p9501

Notice:

When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

Note:

SLP: Safely-Limited Position
SP: Safe Position

2 Parameters

2.2 List of parameters

Note: Re bit 00:
When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.

Re bit 01:
When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

Re bit 03:
When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

Re bit 06:
For the automatic test stop, the test stop can still be initiated via binector input p9705.
The automatic test stop is executed after power up, partial power up or a warm restart.

Note: Re bit 00:
When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.

Re bit 01:
When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

Re bit 02:
This bit defines the type of motor, which the sensorless actual value sensing evaluates.
For bit = 0, the actual velocity is calculated for an induction motor.
For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.
Bit = 0 should be set if no motor is defined (p0300 = 0).

Re bit 03:
When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

Re bit 05:
This bit defines the type of modulation, which the sensorless actual value sensing evaluates.
For bit = 0, the actual velocity is calculated for space vector modulation.
For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

Re bit 06:
When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10046.
Also for the automatic test stop, the test stop of the F-DO can be started using binector input p10007. The test stop for Extended Functions can still be started via p9705.
The automatic test stop is executed after power up, partial power up or a warm restart.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

2 Parameters

2.2 List of parameters

Notice: Re bit 00:
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)
Re bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
Re bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

---	--	---	---

Description: Setting for clock cycle synchronous communication between PROFIdrive controller and Control Unit.
The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 = 1).
If a PROFIdrive controller exchanges process data in clock cycle synchronism with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data in clock cycle synchronism.
Examples for clock cycle synchronous communication:
- clock-cycle synchronous control for the motion control (e.g. SIMOTION).
- clock-cycle synchronous PROFIsafe master (e.g. SIMATIC S7-400F).

Value: 0: Communication not isochronous
1: Communication isochronous

Notice: As of firmware version 2.6, the parameter has no effect.

p9511 SI Motion actual value sensing cycle clock (Control Unit) / SI Mtn act clk CU

HLA	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00000 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 25.00000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00000 [ms]
-----	---	---	--

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- The isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: Refer to: p0115

Note: The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).
 The monitoring clock cycle from p9500 must be an integer multiple of this parameter.
 In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
 The clock cycle time of the actual value sensing should not be set to more than 8 ms.
 A change only becomes effective after a POWER ON.

Description: Sets the safety functions without selection.
 The safety functions without selection are enabled with p9601.5/p9801.5.
 Using this parameter, the individual motion monitoring functions can then be selected (e.g. SLS, SDI positive, SDI negative), which should then be permanently selected.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	04	SLS static (CU)	Statically active	Statically inactive	-
	12	SDI positive static (CU)	Statically active	Statically inactive	-
	13	SDI negative static (CU)	Statically active	Statically inactive	-

Dependency: Refer to: p9601, p9801

Note: A change becomes immediately effective after exiting the safety commissioning mode.
 SDI: Safe Direction (safe motion direction).
 SLS: Safely-Limited Speed

Description:

Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

2 Parameters

2.2 List of parameters

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.0010 [mm]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 360.0000 [mm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.1000 [mm]
Description:	Sets the tolerance for the crosswise data comparison of the actual position between the two monitoring channels. For encoderless motion monitoring functions, the tolerance must be set to a higher value (12 degrees rotary, 1 mm linear).		
Note:	For a linear axis, the tolerance is internally limited to 10 mm. For a "linear axis with rotating motor" and factory setting of p9520, p9521 and p9522, the factory setting of p9542 corresponds to a position tolerance of 36 ° on the motor side.

SERVO (Safety rot), SERVO_AC (Safety rot), SERVO_I_AC (Safety rot), VECTOR (Safety rot), VECTOR_AC (Safety rot), VECTOR_I_AC (Safety rot)	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.0010 [°]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 360.0000 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.1000 [°]
Description:	Sets the tolerance for the crosswise data comparison of the actual position between the two monitoring channels. For encoderless motion monitoring functions, the tolerance must be set to a higher value (12 degrees rotary, 1 mm linear).		
Note:	For a linear axis, the tolerance is internally limited to 10 mm. For a "linear axis with rotating motor" and factory setting of p9520, p9521 and p9522, the factory setting of p9542 corresponds to a position tolerance of 36 ° on the motor side.		
p9543	SI Motion gearbox switching position tolerance factor (CU) / SI Mtn grbx tol CU		
HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min 1	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the factor to increase the tolerance for the crosswise data comparison of the actual position between the two monitoring channels while the gearbox stage is being switched over. This factor is effective when actual value synchronization is activated and when deactivated. Depending on the following tolerance, the following is obtained: - actual value synchronization activated: p9549 * p9543 - actual value synchronization deactivated: p9542 * p9543		
p9544	SI Motion actual value comparison tolerance (referencing) (CU) / SI Mtn ref tol		
HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.0000 [mm]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 36.0000 [mm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0100 [mm]
Description:	Sets the tolerance for checking the actual values. For an incremental encoder, the actual values are checked after referencing; for an absolute encoder, when switching on.		

Note: A change only becomes effective after a POWER ON.
For linear axes, the maximum value is limited to 1 mm.

Description: Sets the tolerance for checking the actual values.
For an incremental encoder, the actual values are checked after referencing; for an absolute encoder, when switching on.

Note: A change only becomes effective after a POWER ON.
For linear axes, the maximum value is limited to 1 mm.

p9545 SI Motion SSM (SGA n < nx) filter time (Control Unit) / SI Mtn SSM filt CU

HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 100.00 [ms]	Access level: 3 Func. diagram: 2823 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
---	--	---	--

Description: Sets the filter time for the SSM feedback signal to detect standstill.

Note: The filter time is effective only if the function is enabled (p9501.16 = 1).
The parameter is included in the crosswise data comparison of the two monitoring channels.
The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

p9546 SI Motion SSM (SGA n < nx) velocity limit (CU) / SI Mtn SSM v_limCU

HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [mm/min]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1000000.00 [mm/min]	Access level: 3 Func. diagram: 2823 Unit selection: - Expert list: 1 Factory setting 20.00 [mm/min]
---	--	---	---

Description: Sets the velocity limit for the SSM feedback signal to detect standstill (n < nx).
When this limit value is undershot, the signal "SSM feedback signal active" (SGA n < n_x) is set.
For p9568 = 0, the value in p9546 is also applicable for the function "SAM".

Caution: The following applies for p9506 = 3:

The "SAM" function is switched out if the selected threshold value is undershot.

Note: F-DO: Failsafe Digital Output / SGA: Safety-related output
SAM: Safe Acceleration Monitor (safe acceleration monitoring)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring) / SGA n < nx: Safety-related output n < nx

	Min	Max	Factory setting
	0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]

Description:

Sets the switch over velocity to SOS.

Below this velocity limit, for a transition to SOS, standstill (zero velocity) is assumed.

The transition times from STOP C, D, E and the delay time when selecting SOS are canceled if this velocity threshold is fallen below. The wait time from p9569 is started, and after it has expired, SOS is active.

For a STOP C, this switchover velocity is the only criterion for prematurely activating an SOS. In the other cases mentioned here, it must first have been signaled that the axis had correctly braked.

Dependency:

Refer to: p9501, p9551, p9552, p9553, p9554

Note:

With p9567 = 0, reducing the wait time for the transition to SOS is deactivated.

Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C0711 with value 7001 is output and safety stop response STOP F.

Description:	Sets the delay time after which STO is executed when the bus fails.		
Dependency:	Refer to: p9561, p9563		
Note:	In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F). The main use of the wait time is the ESR function (Extended Stop and Retract). The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

Description:	Sets the monitoring time to define the brake ramp. The rate of rise of the brake ramp depends upon p9581 (reference value) and p9583 (monitoring time).		
Dependency:	Refer to: p9581, p9582		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.		

p9585	SI Motion actual value sensing sensorless fault tolerance (CU) / ActVal sl tol CU		
SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min -1	Calculated: - Dyn. index: - Units group: - Scaling: - Max 4	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787		
Notice:	Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing. A longer filter time results in a longer response time.		
Notice:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9587 = minimum value, the filter is deactivated.		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock (p9500/p9300) cycle.

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10.00 [%]
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - The value must be increased if C01711 has occurred with message value 1042. - The value must be decreased if C01711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: p0305 x p9783 >= p9588 x 1.2		
Recommend.:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785		
Notice:	If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).		
p9589	SI Motion act. value sensing sensorless acceleration limit (CU) / ActVal sl a_lim CU		
SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 10.00 [%]	Calculated: - Dyn. index: - Units group: - Scaling: - Max 3300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - The value must be increased if C01711 with message value 1043 has occurred. - The value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
Recommend.:	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.		
Dependency:	Refer to: r9784		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9589 = maximum value, the filter is deactivated. Diagnostics parameter p9784 must be used to correctly set this parameter.

Description:	Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.			
Value:	0: Inhibit SBC 1: Enable SBC			
Dependency:	Refer to: p9802			
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1). Recommend.:	The delay time should be set as follows so that the drive can completely decelerate along the OFF3 ramp before the transition into STO: Delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9852		
Note:	For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock (r9780/r9880) cycle. SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).		
Recommend.:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9852		
Note:	For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock (r9780/r9880) cycle. SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

Description: Setting to acknowledge that a component has been replaced.

By writing 29 to this parameter, the unique identifier of a safety-relevant component is transferred into the drive parameterization.

2 Parameters

2.2 List of parameters

Value: 0: [00 hex] hardware replacement acknowledge ready
29: [1D hex] hardware replacement acknowledgment

Notice: It is not permissible that the safety commissioning mode is set in order to write to this parameter.

Note: After successful execution, this parameter is automatically reset to zero.
Data must then be saved in a non-volatile fashion (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
The parameter cannot be written to using a project download, and cannot be set in an offline project.

Description: Sets the signal source for the test stop of the safety-relevant motion monitoring functions.

Notice: Before setting the signal source in p9705 it must be ensured that the signal source is at a logical 0.
If, in the Safety commissioning mode, the signal source in p9705 is set - and it already has a logical 1 - then a test stop is immediately initiated and the messages C01711/C30711 are output with message value 1005.

Note: It is not permissible to use TM54F inputs to start the test stop.

r9707[0...2] **CO: SI Motion diagnostics encoder position actual value GX_XIST1 / SI Mtn XIST1**

Description: Display:
Index0: of the encoder actual value GX_Xist1,
Index1: of the encoder actual value GX_Xist1 in the clock cycle, from which the subsequently transferred reference position was received.
Index2: The difference between index1 and index0 while waiting for the reference position to be transferred.
Index1 and index2 are only relevant for safety monitoring functions requiring an encoder with absolute reference, when "Referencing via SCC" is enabled (p9501 bit27=1)

Index: [0] = Encoder actual value Xist1 on CU
[1] = Encoder actual value Xist1 latched for referencing
[2] = Xist1 latched - reference position difference

Note: The parameter is only available for Safety Integrated with encoder

Description: Displays the actual load-side actual values of both monitoring channels and their difference.

Index: [0] = Load-side actual value on the CU
[1] = Load-side actual value on the second channel
[2] = Load-side actual value difference CU - second channel
[3] = Load-side max. actual value difference CU - second channel
[4] = Load-side actual value as safe position via PROFIsafe
[5] = Load-side additional actual value difference CU - second channel

Dependency: Refer to: r9713

Note:

Re index 0:
The display of the load-side position actual value on the Control Unit is updated in the monitoring clock cycle.

Re index 1:
The display of the load-side position actual value on the second channel is updated in the CDC clock cycle (r9724) and delayed by one CDC clock cycle.

Re index 2:
The difference between the load-side position actual value on the Control Unit and load-side position actual value in the second channel is updated in the CDC clock cycle (r9724) and delayed by one CDC clock cycle.

Re index 3:
The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

Re index 4:
Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".
The value is an average value from the values in index 0 and 1.
When the function is not enabled, the content corresponds to the value in index 0.

Re index 5:
The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter.
Input in p9542: p9708[3] + p9708[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in p9708[3].

2 Parameters

2.2 List of parameters

Note: The value of this parameter is displayed in r9708 with units (mm or degrees).
The display is updated in the safety monitoring clock cycle.

Re index 0:
The display of the load-side position actual value on the Control Unit is updated in the monitoring clock cycle.

Re index 1:
The display of the load-side position actual value on the second channel is updated in the CDC clock cycle (r9724) and delayed by one CDC clock cycle.

Re index 2:
The difference between the load-side position actual value on the Control Unit and load-side position actual value in the second channel is updated in the CDC clock cycle (r9724) and delayed by one CDC clock cycle.

Re index 3:
The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

Re index 4:
Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".
The value is an average value from the values in index 0 and 1.
For a 16-bit notation, the value is influenced using the scaling factor (p9574/p9374).
When the function is not enabled, the content corresponds to the value in index 0.

Re index 5:
The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter. Input in p9542: p9713[3] + p9713[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in p9713[3].

Re bit 04:
When sensing the velocity without encoder, a distinction is made between the closed-loop speed controlled and open-loop speed controlled (U/f) modes.

Re bit 09:
Safe pulse cancellation is a state that can only occur for the combination of velocity sensing without encoder (p9506) and drive-integrated motion monitoring functions without selection (p9601.5). In this state, internally an STO is initiated, which can be withdrawn again using an OFF1 enable.

Re bit 12:
An active test stop is also displayed using the safety message C01798.

SMM: Safe Motion Monitoring

Re bit 22 and 23:
These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.
If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-50.00 [%]	0.00 [%]	-20.00 [%]

Description: Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition:
 $|p0305 \times p9783| \geq p9588 \times 1.2$

Dependency: Refer to: p9588

Notice: Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.

Note: This parameter is only effective for encoderless actual value sensing ($p9506/p9306 = 1, 3$). For p9783 = maximum value, current injection is deactivated. Current injection is not effective in the U/f control mode.

Description: Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module.

0: Inhibit SBC

1: Enable SBC

Dependency: Refer to: p9602

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

Topology comparison component replacement / Topo_cmpr replace

CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: C1(1) Data type: Unsigned8 P-Group: Topology Not for motor type: - Min 0	Calculated: - Dyn. index: - Units group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
--	--	---	---

Description:

For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:

- component type (e.g. "SMC20")
- Order No. (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency:

Refer to: p9904, p9905

Note:

The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Description:	Enters the license key for this drive unit. Example of the license key: EACZ-QBCA = 69 65 67 90 45 81 66 67 65 dec (ASCII characters) Index 0 = license key character 1 (e.g. 69 dec) Index 1 = license key character 2 (e.g. 65 dec) ... Index 8 = license key character 9 (e.g. 65 dec) Index 9 = license key character 10 (e.g. 0 dec) ...		
Dependency:	Refer to: r7843, p9921		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. With the STARTER commissioning software, ASCII characters are not entered coded, i.e. the characters of the license key can be entered as printed in the Certificate of License. In this case, STARTER codes the characters.		
Note:	For an invalid license key, all the indices have the value 0 dec. Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-"). When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec. After entering the license key, the license key must be activated (p9921). If the licensing is not adequate, then the following alarm is displayed together with LED: - A13000 --> licensing not sufficient - LED READY --> flashes green/red with 0.5 Hz

Description:	Activates the entered license key. The following is executed when activating the license key. - the checksum of the entered license key is checked. - the entered license key is saved in a non-volatile fashion on the memory card. - re-enter the license key.		
Value:	0: Inactive 1: Activate start license key		
Dependency:	Refer to: p9920		
Note:	Before activation, the license key entered using parameter p9920 is checked. If this check identifies an error, activation is rejected. In this case, writing a 1 to p9921 is rejected. When the license key has been activated, p9921 is automatically set to 0.

2 Parameters

2.2 List of parameters

Dependency: Refer to: r9936, p9938
Note: Re bit 00:
To activate this function, p9938 must be set to 0 (inactive).
After changing the error counter (r9936), an appropriate alarm is output.
The alarm automatically disappears after 5 seconds.
Re bit 08:
With p9937.8 = 1, the error counters are reset (r9936[0...199]).
After the reset, p9937.8 is automatically set to 0.

Description: Sets the configuration for the DRIVE-CLiQ detailed diagnostics (r9943).
Using the detailed diagnostics, it is possible to investigate data transfer errors on an individual connection, selected using p9942.

Value:
0: Inactive
1: Sum send and receive errors
2: Only send errors
3: Only receive errors
4: Siemens internal
5: Siemens internal
6: Siemens internal

Dependency: The functions in p9938 can only be set for p9937.0 = 0.
Refer to: r9936, p9937, p9939, p9942

Notice:
If value = 0:
- detailed diagnostics is inactive.
- the error counter is active (r9936).
If value > 0:
- the error counter is inactive (r9936).
- the detailed diagnostics as configured is active (r9943).

Index:
 [0] = Drive 1
 [1] = Drive 2
 [2] = Drive 3
 [3] = Drive 4
 [4] = Drive 5
 [5] = Drive 6

Note:
 - If only index 0 of p10000 is used, then p10000[0] defines the communication clock cycle that is applicable for all drives used in p10010[]. In this case, all safety monitoring clock cycles on the Control Unit must be identical with p10000[0].
 - The minimum communication clock cycle is 1 ms.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	4.00 [ms]	2000.00 [ms]	500.00 [ms]
Description:	Sets the delay time for testing the digital output. Within this time, for a forced checking procedure of the digital output, the signal must have been detected via the corresponding readback input (p10047).		
Dependency:	Refer to: p10003, p10007, p10017, p10046		
Note:	The delay time must be set to a value greater than the debounce time (p10017). The set time is rounded internally to an integer multiple of the TM54F sampling time (r10015). Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test. The test stop is only performed if the safety output is being used (see p10042).

2 Parameters

2.2 List of parameters

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Dependency:	Refer to: p9501, p9601, p10117, p10140, p10150				
Note:	F-DI: Failsafe Digital Input				
	If a safety function is assigned to an input (e.g. via p10122), then the following applies:				
	- logical "0": Safety function is selected				
	- logical "1": Safety function is de-selected				
	The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:				
	With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.				
	This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.				
	With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.				
	This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.				
	The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.				
	The parameter is only updated in the following cases:				
	- If the Safety Extended Functions are enabled by means of activation via F-DI.				
	- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).				
	In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

2.2 List of parameters

Note: For p9601.3 = p9801.3 = 1 (PROFIsafe enabled), the following variants exist when parameterizing PROFIsafe telegram 30:

- p9611 = p9811 = 998 and p60022 = 0
- p9611 = p9811 = 998 and p60022 = 30
- p9611 = p9811 = 30 and p60022 = 30

	Min	Max	Factory setting
	700	999	999

Description: Sets the telegram for the safety information channel (SIC) / safety control channel (SCC).
The SIC/SCC telegram p60122 is attached directly to the PZD telegram p0922/p2079.

Value:
700: Supplementary telegram 700, PZD-0/3
701: Supplementary telegram 701, PZD-2/5
999: Free telegram configuration with BICO

Note: The clearance to the PZD telegram can be increased using p2070/p2071.
After changing p0922/p2079 or p2070/p2071, then p60122 must be set again.
The telegram interconnections can only be changed if p60122 and p0922 are both set to 999.

2.4.3 Parameters with "KHP_ACTIVE_READ"

The following list contains the parameters with the "KHP_ACTIVE_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS S120/S150, Version: 4702900, Language: eng, Type: KHP_ACTIVE_READ

p0015	Macro drive object / Macro DO
p0015	Macro drive unit / Macro drv unit
p0100	IEC/NEMA mot stds / IEC/NEMA mot stds
p0101[0...n]	Drive object numbers / DO numbers
p0103[0...n]	Application-specific view / Appl_spec view
p0105	Activate/de-activate drive object / DO act/deact
p0107[0...n]	Drive object type / DO type
p0108[0...n]	Drive objects function module / DO fct_mod
p0120	Number of Power unit Data Sets (PDS) / PDS count
p0120	Number of Valve Data Sets (PDS) / PDS count
p0121[0...n]	Power unit component number / PU comp_no
p0125[0...n]	Activate/de-activate power unit components / PU_comp act/deact
p0130	Number of Motor Data Sets (MDS) / MDS count
p0131[0...n]	Motor component number / Mot comp_no
p0140	Number of VSM data sets / VSM count
p0140	Number of Encoder Data Sets (EDS) / EDS count
p0141[0...n]	VSM component number / VSM comp_no
p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_intf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0145[0...n]	Voltage Sensing Module activate/de-activate / VSM act/deact
p0145[0...n]	Activate/de-activate encoder interface / Enc_intf act/deact
p0150	VSM2 data sets selection / VSM2 dat_sets qty
p0150	Number of VSM data sets / VSM dat_sets qty.
p0151[0...n]	Voltage Sensing Module 2 component number / VSM2 comp_no
p0151[0...1]	DRIVE-CLiQ Hub Module component number / Hub comp_no
p0151	Terminal Module component number / TM comp_no
p0151[0...n]	Voltage Sensing Module component number / VSM comp_no
p0161	Valve component number / Valve comp_no
p0161	HF Damping Module component number / HF Damp comp_no
p0161	Option board component number / Opt board comp_no
p0162	CU-LINK slave component number / CU-LINK comp_no
p0162	HF Choke Module component number / HF Choke comp_no
p0170	Number of Command Data Sets (CDS) / CDS count
p0180	Number of Drive Data Sets (DDS) / DDS count
p0199[0...24]	Drive object name / DO name
p0300[0...n]	Motor type selection / Mot type sel
p0304[0...n]	Rated motor voltage / Mot U_rated
p0305[0...n]	Rated motor current / Mot I_rated
p0349	System of units motor equivalent circuit diagram data / Unit_sys mot ESB
p0400[0...n]	Encoder type selection / Enc_typ sel
p0505	Selecting the system of units / Unit sys select
p0595	Technological unit selection / Tech unit select
p0806	BI: Inhibit master control / PcCtrl inhibit
p0864	BI: System pressure available / p_sys available
p0864	BI: Infeed operation / INF operation
p0915[0...29]	TM15 PROFIdrive PZD setpoint assignment / TM15 PD PZD setp
p0915[0...35]	TM17 PROFIdrive PZD setpoint assignment / TM17 PD PZD setp
p0916[0...29]	TM15 PROFIdrive PZD actual value assignment / TM15 PD PZD actVal
p0916[0...35]	TM17 PROFIdrive PZD actual value assignment / TM17 PD PZD actVal
p0922	IF1 PROFIdrive PZD telegram selection / IF1 PZD telegr

2.4 Parameters for write protection and know-how protection

p0978[0...n]	List of drive objects / List of the DO
p1080[0...n]	Minimum velocity / v_min
p1080[0...n]	Minimum speed / n_min
p1082[0...n]	Maximum velocity / v_max
p1082[0...n]	Maximum speed / n_max
p1520[0...n]	CO: Force limit upper/motoring / F_max upper/mot
p1520[0...n]	CO: Torque limit upper/motoring / M_max upper/mot
p1520[0...n]	CO: Torque limit upper / M_max upper
p1532[0...n]	CO: Force offset, force limit / F_max offset
p1532[0...n]	CO: Torque limit offset / M_max offset
p1544	Travel to fixed stop evaluation torque reduction / TfS M_red eval
p1544	Travel to fixed stop evaluation force reduction / TfS F_red eval
p2000	Reference frequency / f_ref
p2000	Reference speed reference frequency / n_ref f_ref
p2000	Reference velocity reference frequency / v_ref f_ref
p2000	Reference velocity / v_ref
p2001	Reference voltage / Reference voltage
p2002	Reference current / I_ref
p2002	Reference pressure / p_ref
p2003	Reference force / F_ref
p2003	Reference torque / M_ref
p2003	Reference force / Reference force
p2005	Reference angle / Reference angle
p2006	Reference temp / Ref temp
p2007	Reference acceleration / a_ref
p2030	Field bus int protocol selection / Field bus protocol
p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode
p2079	IF1 PROFIdrive PZD telegram selection extended / IF1 PZD telegr ext
p4956[0...n]	OA DO-specific activation / OA DO act
p5043[0...6]	Spindle speed limits / n_limits
p7763	KHP OEM exception list number of indices for p7764 / KHP OEM qty p7764
p7764[0...n]	KHP OEM exception list / KHP OEM excep list
p7852	Number of indices for r7853 / Qty indices r7853
p8836	SINAMICS Link address / SINAMICS Link add
p8870[0...15]	SINAMICS Link receive telegram word PZD / Recv link word
p8871[0...15]	SINAMICS Link send telegram word PZD / Send link word
p8872[0...15]	SINAMICS Link address receive PZD / Link addr recv
p9500	SI Motion monitoring clock cycle (Control Unit) / SI Mtn clock CU
p9601	SI enable functions integrated in the drive (Control Unit) / SI enable fct CU
p9810	SI PROFIsafe address (Motor Module) / SI PROFIsafe MM
p9902	Target topology number of indices / TargetTopo indices

Data sets		Information on parameters, binectors, connectors					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters).				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit] rotary axis, for linear axis see list of parameters.				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "y" specifies the valid index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "y" specifies the applicable index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.				
		[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]				
		Samplings times					
		Symbol	Meaning				
		pxxxx[Y] (ZZZ.ZZ μs)	Setting parameter with factory setting to select the time slice.				
		p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "y" specifies the applicable index.				
		p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "y" specifies the applicable index.				
		PROFIdrive sampling time	Presetting for IF1 in p2048. Presetting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.				
		CAN bus sampling time	Presetting in p8848.				
		Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.				
		Not relevant	A static state is displayed here. The sampling time data is not relevant.

Handling BICO technology

Binector:  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector:  Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
 "Bi:" parameter for binectors (Bi = Binector Input)
 or
 "Ci:" parameter for connectors (Ci = Connector Input)

Example:

The main setpoint for the speed controller (Ci: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (Bi: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> Differential input!
For an input signal referred to ground, terminal X131.8 must be connected to reference potential M.
Caution:
The voltage between an input (X131.7 or X131.8) and the grounding point must not exceed 35 V.
When the load resistor is switched in (S5.0 closed), the voltage between the input terminals must not exceed 15 V.

<1> The drive object CU_LINK only exists for automation systems with SINAMICS Integrated (e.g. SIMOTION D, SINUMERIK NCU) and the corresponding controller extension (e.g. CX32-2, NX10).
On the SINAMICS Integrated, each controller extension is represented by a drive object CU_LINK.
<2> p8800: CU_LINK address.
Address of the controller extension, represented by the drive object CU_LINK. The address correlates with the DRIVE-CLiQ socket of the Control Unit connected to the controller extension configured.
Value range: See p0918 (PROFIBUS address)
The parameter p8800 is only readable through non-cyclic parameter access via DPV1 services.

<1> Depending on the drive object, only specific telegrams can be used. Not suitable for sensorless vector control.
 <2> If p0922 = 999 is changed to another value, the telegram is automatically assigned as specified in [2415] - [2424].
 If p0922 ≠ 999 is changed to p0922 = 999, the "old" telegram assignment is maintained as specified in [2415] - [2424].
 <3> The maximum number of PZD words depends on the drive object type.
 <4> Only for SINAMICS S120/S150.

- <1> The number of PZD send words depends on the drive object type.
- <2> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD).
The two corresponding connector inputs cannot be interconnected.
- <3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x).
The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0%.
- <4> To comply with the PROFdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.

- <1> The number of PZD receive words depends on the drive object type.
- <2> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
- <3> The following representation applies for words: 4000 hex = 100 % for double words 40000 0000 hex = 100 %.
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).
The following applies for temperature values: 100 °C -> 100 % = 4000 hex or 40000 0000 hex; 0 °C -> 0 %.
- <4> Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 5 to 16 and used as binectors.
- <5> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r8850 or r8860 can have a value ≠ 0 for a PZD word.
- <6> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.

3.11 Brake control

Function diagrams

2701 – Basic brake control (r0108.14 = 0)	1958
2704 – Extended brake control, zero-speed detection (r0108.14 = 1)	1959

2711 – Extended brake control, signal outputs (r0108.14 = 1)	1961

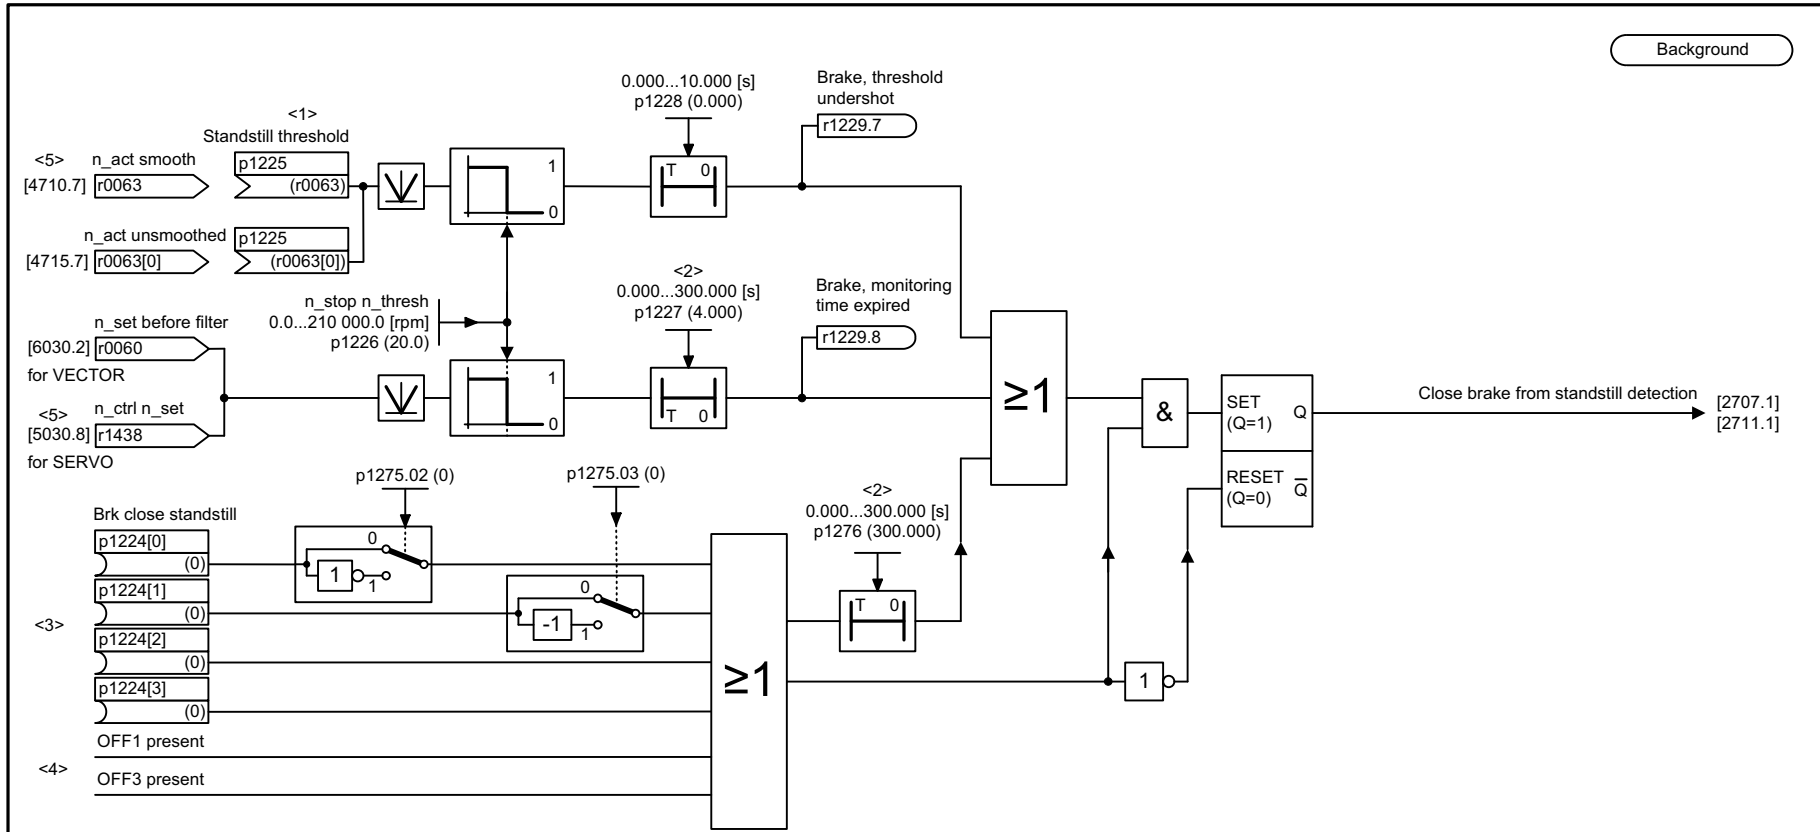

- <1> Motor holding brake configuration (p1215)
0 = No motor holding brake being used.
1 = Motor holding brake acc. to sequence control.
2 = Motor holding brake always released.
3 = Motor holding brake like sequence control, connection via BICO.
- <2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
- <3> If p1215 = 0, 2 -> t = 0 ms.
- <4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
- <5> For p1227 = 300 s, the monitoring function is deactivated.
- <6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).
r0046.21 = 1, if p0858 = 1 or p0856 = 0.
The signal generation is shown simplified.
- <8> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).
- <9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
- <10> Only for SINAMICS S120.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>
Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

Fig. 3-106 2704 – Extended brake control, zero-speed detection (r0108.14 = 1)

- <1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
- <2> For p1276 = 300.000 s, the timer is de-activated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
- <3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
- <4> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
- <5> Only for SINAMICS S120.

<1> This pulse enable path only works for operation with brake (p1215 > 0).
 <2> For brakes with one single checkback signal, the inverted signal has to be interconnected to the BICO input for the second checkback. The switching times of the brake are set in p1216 and p1217.
 <3> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
 <4> If an external motor holding brake is used, p1215 should be set to 3 and r1229.1 should be used as control signal.
 <5> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
 <6> If the function module "extended brake control" is active (r0108.14 = 1), r1229.1 should be interconnected as control signal.

Ramp-function generator selection

Ramp-function generator tracking

Ramp-function generator status word

- <1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.
- <2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set (SERVO: to the actual value, VECTOR, VECTOR3P, VECTORGL, VECTORMV, VECTORSL: to the setpoint (r1170)) and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective.
For SERVO is valid: When the function module "extended setpoint channel" is not active (r0108.8 = 0), for OFF1/OFF3 the down ramp of the basic ramp-function generator is effective (refer to n_set_4 on [3060.8]).
- <3> The interpolator is only active with activated "basic positioner" Function Module or with isochronous PROFIdrive mode and sign of life received by the master (STW2.12 ... STW2.15).
- <4> Behavior of the response ramp of the torque limiting:
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").
- <5> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).
- <6> For SERVO only.
- <7> For VECTOR, VECTOR3P, VECTORMV only.
- <8> For VECTORGL only.
- <101> To view the pre-assignment of the sampling times in p0115, refer to p0112.

SINAMICS
Control Unit

p0115[1] (Drive Object)

<1> Principle of operation of Dynamic Servo Control (DSC): The feedback branch {2} completely compensates the feedback coupling branch {1} in respect of the position actual value sent from the drive. The fast actual value channel {3} allows for a high dynamic performance and high Kv factors.
 <2> For the motor encoder (p1192 = 1) p1193 = 1 is effective. When using encoder 2 or 3 (p1192 = 2, 3), p1193 corresponds to the "Increments per motor encoder revolution/increments of the encoder selected (2, 3) during one motor rotation" (considering gear ratios and also different encoder lines and fine resolutions).

<3> The deadtime for the PROFIdrive data transfer is set automatically.
 <4> The position deviation must be referred to the increments of the motor including the fine resolution.
 <5> Normalization of KPC: If signal $\Delta x = 1$ motor revolution and KPC = 1, then "n_set from DSC" = 0.001 motor revolutions/s.
 <6> Clock-synchronous operation must be active for DSC.
 <7> Only for p1400.17 = 1 and at limitation becomes p1407.19 = 1.

<8> With active symmetrization (T_SYMM > 0), the speed feedforward value is balanced using the sum of the following time constants: T_SYMM (refer to p1195) + T_SYMM_ADD (p1427) + 0.5 * T_Speed controller (p0115[1]). It is actualised with every DRIVE-CLIQ base tact.
 <9> Not for DO ENC.

- <1> Only for encoder:
p1400.10 = 1 is recommended if a torque pre-control signal is also connected at [5060] in addition to the speed pre-control signal.
- <2> The interpolator is only effective for clock-cycle synchronous PROFdrive operation and sign-of-life received from the master (STW2.12 ... STW2.15). If the Dynamic Servo Control (DSC) is active, an additional deadtime of one speed controller clock cycle is effective.
- <3> For a 1/0 edge from control command STW2.8 "travel to fixed stop" [2444] the output of all filters is set to the input value for an instantaneous response to a change of the speed setpoint sign.
- <4> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

- <1> Only for measuring equipment with $R_i \geq 1 \text{ M}\Omega$.
- <2> With the factory setting, input values from -100...100 % result in output voltages from 0...4.98 V.
- <3> The input signals are determined by the reference quantities p200x (100 % corresponds to p200x). The calculated normalization is indicated via r0786.
- <4> Example: If a speed signal is entered via p0071 and r0786 indicates 100.0, a speed change of 100 rpm results in an output voltage change of 1.0 V.

4.1 Overview of faults and alarms

4.1.1 General information

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is initiated • Status signal ZSW1.3 is set. • The fault is entered into the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. <p>If the cause of the alarm is no longer present, they automatically reset themselves.</p>

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs,</p> <p>Note</p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p>Closed-loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> • n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired.</p> <p>Torque control (p1300 = 23)</p> <ul style="list-style-type: none"> • The following applies for torque control: Reaction as for OFF2. • When the system switches to torque control with p1501, the following applies: No separate braking reaction. <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault response only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse inhibit	<p>Closed-loop speed and torque control</p> <ul style="list-style-type: none"> • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

The conditions for p1231 = 4 must be observed. For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1232, p1233, p1234).
ENCODER	-	Internal/external pulse inhibit (p0491)	<p>The fault reaction ENCODER is applied as a function of the setting in p0491. Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 4-3 Acknowledging faults

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 2282) has the following layout:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name
Message value:	Component number: %1, fault cause: %2
Message class:	Text of the message class (number according to PROFIdrive)
Drive object:	List of objects.
Reaction:	NONE
Acknowledgement:	NONE
Cause:	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).
Remedy:	Description of possible remedies.
Response to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)
Acknowl. upon F:	IMMEDIATELY (POWER ON)
Response upon N:	NONE
Acknowl. upon N:	NONE

----- **End of example** -----

Axxxxx	Alarm xxxxx
Axxxxx (F, N)	Alarm xxxxx (message type can be changed to F or N)
Fxxxxx	Fault xxxxx
Fxxxxx (A, N)	Fault xxxxx (report type can be changed to A or N)
Nxxxxx	No message
Nxxxxx (A)	No message (message type can be changed to A)
Cxxxxx	Safety message (separate message buffer)

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note

You can change the default properties of a fault or alarm by setting parameters.

References: /IH1/ SINAMICS S120 Commissioning Manual
Section "Diagnostics"

The "List of faults and alarms" (Page 2282) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

4.1 Overview of faults and alarms

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces" (Page 2276). In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
Specifies the "Channel error type" of the PROFINET channel diagnostics.
When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
Specifies the bit number in date set DS1 of the diagnostic alarm for SIMATIC S7.
When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.
- ET 200 (dec)
Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.
When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)
Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 2271)

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 2273)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0..63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0..7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

 WARNING
--

On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms

Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 2282).

Faults and alarms are organized into the following number ranges:

Internal software error

Message value: Module: %1, line: %2
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An internal software error has occurred.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy:
- evaluate fault buffer (r0945).
- carry out a POWER ON (power off/on) for all components.
- if required, check the data on the non-volatile memory (e.g. memory card).
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

FloatingPoint exception

Message value: %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An exception occurred during an operation with the FloatingPoint data type.
The error may be caused by the basic system or an OA application (e.g., FBLOCKS, DCC).
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Note:
Refer to r9999 for further information about this fault.
r9999[0]: Fault number.
r9999[1]: Program counter at the time when the exception occurred.
r9999[2]: Cause of the FloatingPoint exception.
Bit 0 = 1: Operation invalid
Bit 1 = 1: Division by zero
Bit 2 = 1: Overflow
Bit 3 = 1: Underflow
Bit 4 = 1: Inaccurate result
Remedy:
- carry out a POWER ON (power off/on) for all components.
- check configuration and signals of the blocks in FBLOCKS.
- check configuration and signals of DCC charts.
- upgrade firmware to later version.
- contact the Hotline.

F01005 Firmware download for DRIVE-CLiQ component unsuccessful

Message value: Component number: %1, fault cause: %2
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: It was not possible to download the firmware to a DRIVE-CLiQ component.
Fault value (r0949, interpret hexadecimal):
yyxxxx hex: yy = component number, xxxx = fault cause
xxxx = 000B hex = 11 dec:
DRIVE-CLiQ component has detected a checksum error.
xxxx = 000F hex = 15 dec:
The selected DRIVE-CLiQ component did not accept the contents of the firmware file.

4 Faults and alarms

4.2 List of faults and alarms

xxxx = 0012 hex = 18 dec:

Firmware version is too old and is not accepted by the component.

xxxx = 0013 hex = 19 dec:

Firmware version is not suitable for the hardware release of the component.

xxxx = 0065 hex = 101 dec:

After several communication attempts, no response from the DRIVE-CLiQ component.

xxxx = 008B hex = 139 dec:

Initially, a new boot loader is loaded (must be repeated after POWER ON).

xxxx = 008C hex = 140 dec:

Firmware file for the DRIVE-CLiQ component not available on the memory card.

xxxx = 008D hex = 141 dec:

An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.

xxxx = 008F hex = 143 dec:

Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.

xxxx = 0090 hex = 144 dec:

When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.

xxxx = 0091 hex = 145 dec:

Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.

xxxx = 009C hex = 156 dec:

Component with the specified component number is not available (p7828).

xxxx = Additional values:

Only for internal Siemens troubleshooting.

Remedy:

- check the selected component number (p7828).
- check the DRIVE-CLiQ wiring.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

Firmware update for DRIVE-CLiQ component required

Message value:

Component number: %1

Message class:

General drive fault (19)

Drive object:

All objects

Reaction:

NONE

Acknowledge:

NONE

Cause:

The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

Remedy:

Firmware update using the commissioning software:

The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.

Firmware update via parameter:

- take the component number from the alarm value and enter into p7828.
- start the firmware download with p7829 = 1.

A01007	POWER ON for DRIVE-CLiQ component required
Message value:	Component number: %1
Message class:	General drive fault (19)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	A DRIVE-CLiQ component must be powered up again (POWER ON) (e.g. due to a firmware update). Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component. Note: For a component number = 1, a POWER ON of the Control Unit is required.
Remedy:	- Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again. - For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.

A01009 (N)	CU: Control module overtemperature
Message value:	-

F01011 (N)	Download interrupted
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The project download was interrupted. Fault value (r0949, interpret decimal): 1: The user prematurely interrupted the project download. 2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).

4 Faults and alarms

4.2 List of faults and alarms

3: The project download was prematurely ended by the commissioning software (e.g. STARTER, SCOUT).
100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".

Note:

The response to an interrupted download is the state "first commissioning".

Remedy:

- check the communication cable.
- download the project again.
- boot from previously saved files (power-down/power-up or p0976).
- when loading into the file system (download from memory card), use the matching version.

Project conversion error

Message value: %1

Message class: Hardware / software error (1)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause:

When converting the project of an older firmware version, an error occurred.

Fault value (r0949, interpret decimal):

Parameter number of the parameter causing the error.

For fault value = 600, the following applies:

The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.

Notice:

Monitoring of the motor temperature is no longer ensured.

Remedy:

Check the parameter indicated in the fault value and correctly adjust it accordingly.

For fault value = 600:

Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.

Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.

Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.

Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.

- If necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.

- If necessary, upgrade the firmware to a later version.

F01040 Save parameter settings and carry out a POWER ON

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, CU_I, CU_I_D410, CU_LINK, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL

Reaction: OFF2

Acknowledge: POWER ON

Cause: A parameter was changed in the drive system which means that it is necessary to save the parameters and re-boot.

Remedy:

- save parameters (p0971, p0977).
- carry out a POWER ON (power off/on) for all components.

Then:

- upload the drive unit (commissioning software).

F01040 Save parameter settings and carry out a POWER ON

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: POWER ON
Cause: A parameter was changed in the drive system which means that it is necessary to save the parameters and re-boot.
Examples:

- p1810.2 (wobulation of the pulse frequency) and p1802 (edge modulation)
- p1750.5 (cl.-loop control mode PESM up to f=0Hz with HF signal injection)

Remedy:

- save parameters (p0971, p0977).
- carry out a POWER ON for all components (switch-on the Control Unit with or after the power units).

When changing p1750.5 or p1810.2 for edge modulation, a warm restart is sufficient (p0009 = 30, p0976 = 3).

Then:

- upload the drive unit (commissioning software).

F01041 Parameter save necessary

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: Defective or missing files were detected on the memory card when booting.
Fault value (r0949, interpret decimal):

- 1: Source file cannot be opened.
- 2: Source file cannot be read.
- 3: Target directory cannot be set up.
- 4: Target file cannot be set up/opened.
- 5: Target file cannot be written to.

Additional values:
Only for internal Siemens troubleshooting.

Remedy:

- save the parameters.
- download the project again to the drive unit.
- update the firmware
- if required, replace the Control Unit and/or memory card card.

F01043 Fatal error at project download

Message value: Fault cause: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction:
 Infeed: OFF2 (OFF1)
 Servo: OFF2 (OFF1, OFF3)
 Vector: OFF2 (OFF1, OFF3)
 Hla: OFF2 (OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: A fatal error was detected when downloading a project using the commissioning software.

Fault value (r0949, interpret decimal):

- 1: Device status cannot be changed to Device Download (drive object ON?).
 - 2: Incorrect drive object number.
 - 3: A drive object that has already been deleted is deleted again.
 - 4: Deleting of a drive object that has already been registered for generation.
 - 5: Deleting a drive object that does not exist.
 - 6: Generating an undeleted drive object that already existed.
 - 7: Regenerating a drive object already registered for generation.
 - 8: Maximum number of drive objects that can be generated exceeded.
 - 9: Error while generating a device drive object.
 - 10: Error while generating target topology parameters (p9902 and p9903).
 - 11: Error while generating a drive object (global component).
 - 12: Error while generating a drive object (drive component).
 - 13: Unknown drive object type.
 - 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
 - 15: Drive status cannot be changed to drive download.
 - 16: Device status cannot be changed to "ready for operation".
 - 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
 - 18: A new download is only possible if the factory settings are restored for the drive unit.
 - 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
 - 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR).
 - 21: Error when accepting the download parameters.
 - 22: Software-internal download error.
- Additional values: only for internal Siemens troubleshooting.

4 Faults and alarms

4.2 List of faults and alarms

- Remedy:**
- use the current version of the commissioning software.
 - modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
 - change the drive state (is a drive rotating or is there a message/signal?).
 - carefully note any other messages/signals and remove their cause.
 - boot from previously saved files (power-down/power-up or p0976).

F01044 CU: Descriptive data error

- Message value:** %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An error was detected when loading the descriptive data saved in the non-volatile memory.
Remedy: Replace the memory card or Control Unit.

A01045 CU: Configuring data invalid

- Message value:** %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: An error was detected when evaluating the parameter files PSxxxxxy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.
Alarm value (r2124, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy:
 - Check the parameters displayed in r9406 up to r9408, and correct these if required.
 - Restore the factory setting using (p0976 = 1) and re-load the project into the drive unit.Then save the parameterization in STARTER using the "Copy RAM to ROM" function or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.

A01049 CU: It is not possible to write to file

- Message value:** %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted.
Alarm value (r2124, interpret decimal):
Drive object number.
Remedy: Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/...
When required, remove write protection and save again (e.g. set p0977 to 1).

F01050 Memory card and device incompatible

- Message value:** -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: Infeed: OFF2 (NONE, OFF1)
Servo: OFF2 (NONE, OFF1, OFF3)

Hla: OFF2 (NONE, OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause: The memory card and the device type do not match (e.g. a memory card for SINAMICS S is inserted in SINAMICS G).

Remedy:

- insert the matching memory card.
- use the matching Control Unit or power unit.

F01054

CU: System limit exceeded

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: At least one system overload has been identified.

Fault value (r0949, interpret decimal):
1: Computing time load too high (r9976[1]).
5: Peak load too high (r9976[5]).

Note:

As long as this fault is present, it is not possible to save the parameters (p0971, p0977).
See also: r9976 (System utilization)

Remedy:

Re fault value = 1, 5:

- reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %.
- check the sampling times and adjust if necessary (p0115, p0799, p4099).
- de-activate function modules.
- de-activate drive objects.
- remove drive objects from the target topology.
- note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies

- the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The utilization for a data memory area is too large.
Fault value (r0949, interpret binary):
Bit 0 = 1: High-speed data memory 1 overloaded
Bit 1 = 1: High-speed data memory 2 overloaded
Bit 2 = 1: High-speed data memory 3 overloaded
Bit 3 = 1: High-speed data memory 4 overloaded

Remedy:

- de-activate the function module.
- de-activate drive object.
- remove the drive object from the target topology.

A01069 Parameter backup and device incompatible

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: The parameter backup on the memory card and the drive unit do not match.
The module boots with the factory settings.
Example:
Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.

Remedy:

- insert a memory card with compatible parameter backup and carry out a POWER ON.
- insert a memory card without parameter backup and carry out a POWER ON.
- save the parameters (p0977 = 1).

F01070 Project/firmware is being downloaded to the memory card

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: An upgrade (project/firmware download) was initiated on the memory card.
While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated.
Caution:
During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit.
If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.

Remedy: Not necessary.
The fault automatically disappears after the upgrade has been completed.

F01072 Memory card restored from the backup copy

Message value: -
Message class: General drive fault (19)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.
After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.
Remedy: Check that the firmware and parameterization is up-to-date.

A01073 (N) POWER ON required for backup copy on memory card

Message value: -
Message class: General drive fault (19)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The parameter assignment on the visible partition of the memory card has changed.
In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.
Note:
It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).
Remedy:
- carry out a POWER ON (power off/on) for the Control Unit.
- carry out a hardware reset (RESET button, p0972).

Cause: The time master exited the selected tolerance window for time synchronization.
See also: p3109 (RTC real time synchronization tolerance window)
Remedy: Select the re-synchronization interval so that the synchronization deviation between the time master and drive system lies within the tolerance window.
See also: r3108 (RTC last synchronization deviation)

A01100 CU: Memory card withdrawn

Message value: -
Message class: General drive fault (19)
Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The memory card (non-volatile memory) was withdrawn during operation.
Notice:
It is not permissible for the memory card to be withdrawn or inserted under voltage.
Remedy:
- power down the drive system.
- re-insert the memory card that was withdrawn - this card must match the drive system.
- power up the drive system again.

8: DI/DO 13 (X132.8)
16: DI/DO 14 (X132.10)
32: DI/DO 15 (X132.11)
64: DI/DO 8 (X122.7)
128: DI/DO 12 (X132.7)

Remedy: Reduce the frequency of the pulses at the measuring probe input.
Reaction upon A: NONE
Acknowl. upon A: NONE

F01122 (A) Frequency at the measuring probe input too high

Message value: %1
Message class: Application / technological function faulted (17)
Drive object: CU_NX_CX, SERVO_AC, VECTOR_AC
Reaction: OFF1 (OFF2)
Acknowledge: IMMEDIATELY
Cause: The frequency of the pulses at the measuring probe input is too high.
Fault value (r0949, interpret decimal):
1: DI/DO 9 (X122.8)
2: DI/DO 10 (X122.10)
4: DI/DO 11 (X122.11)
64: DI/DO 8 (X122.7)

Remedy: Reduce the frequency of the pulses at the measuring probe input.
Reaction upon A: NONE
Acknowl. upon A: NONE

F01123 Power unit does not support digital inputs/outputs

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: SERVO
Reaction: OFF1 (OFF2)
Acknowledge: IMMEDIATELY
Cause: Power unit does not support the activated "digital inputs/outputs" function module
Remedy: De-activate the function module.

F01150 CU: Number of instances of a drive object type exceeded

Message value: Drive object type: %1, number permitted: %2, actual number: %3
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The maximum permissible number of instances of a drive object type was exceeded.
Drive object type:
Drive object type (p0107), for which the maximum permissible number of instances was exceeded.
Number permitted:
Max. permissible number of instances for this drive object type.
Actual number:
Current number of instances for this drive object type.
Note regarding the message value:
The individual information is coded as follows in the message value (r0949/r2124):
ddccbbaa hex: aa = drive object type, bb = number limited, cc = actual number, dd = no significance

Remedy:
- power down the unit.
- suitably restrict the number of instances of a drive object type by reducing the number of inserted components.
- re-commission the unit.

F01151	CU: Number of drive objects of a category exceeded
Message value:	Drive object category: %1, number permitted: %2, actual number: %3
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The maximum permissible number of drive objects of a category was exceeded. Drive object category: Drive object category, for which the maximum permissible number of drive objects was exceeded. Number permitted: Max. permissible number for this drive object category. Actual number: Actual number for this drive object category. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): ddccbbaa hex: aa = drive object category, bb = number limited, cc = actual number, dd = no significance
Remedy:	- power down the unit. - suitably restrict the number of drive objects of the specified category by reducing the number of inserted components. - re-commission the unit.

F01152	CU: Invalid constellation of drive object types
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	POWER ON
Cause:	It is not possible to simultaneously operate drive object types SERVO, VECTOR and HLA. A maximum of 2 of these drive object types can be operated on a Control Unit.
Remedy:	- power down the unit. - restrict the use of drive object types SERVO, VECTOR, HLA to a maximum of 2. - re-commission the unit.

F01200	CU: Time slice management internal software error
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	A time slice management error has occurred. It is possible that the sampling times have been inadmissibly set. Fault value (r0949, interpret hexadecimal): 998: Too many time slices occupied by OA (e.g. DCC). 999: Too many time slices occupied by the basic system. Too many different sampling times may have been set. Additional values: Only for internal Siemens troubleshooting.
Remedy:	- check the sampling time setting (p0112, p0115, p4099, p9500, p9511). - contact the Hotline.

F01205	CU: Time slice overflow
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	Insufficient processing time is available for the existing topology. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- reduce the number of drives. - increase the sampling times.
F01221	CU: Bas clk cyc too low
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The closed-loop control / monitoring cannot maintain the envisaged clock cycle. The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	Increase the basic clock cycle of DRIVE-CLiQ communication. See also: p0112 (Sampling times pre-setting p0115)
F01222	CU: Basic clock cycle too low (computing time for communication not available)
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM150, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A time slice has not been defined that fulfills the requirements. The port cannot be correctly operated as the alternating cyclic clock cycle cannot be maintained. Fault value (r0949, interpret hexadecimal): Method ID. Note: Only for internal Siemens troubleshooting.
Remedy:	Contact the Hotline.
A01223	CU: Sampling time inconsistent
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified. Alarm value (r2124, interpret decimal): 1: Value lower than minimum value. 2: Value higher than maximum value. 3: Value not a multiple of 1.25 µs. 4: Value does not match clock-cycle synchronous PROFIBUS operation. 5: Value not a multiple of 125 µs.

- 6: Value not a multiple of 250 μs .
 7: Value not a multiple of 375 μs .
 8: Value not a multiple of 400 μs .
 10: Special restriction of the drive object violated.
 20: On a SERVO with a sampling time of 62.5 μs , more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).
 21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).
 30: Value less than 31.25 μs .
 31: Value less than 62.5 μs (31.25 μs is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).
 32: Value less than 125 μs .
 33: Value less than 250 μs .
 40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 μs . Further, none of the nodes has a sampling time of less than 125 μs .
 41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 μs .
 42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 μs .
 43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.
 44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).
 45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 μs or 187.5 μs (for a 2 or 3x parallel connection).
 46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.
 52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 μs .
 54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 μs .
 56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 μs .
 58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 μs .
 99: Inconsistency of cross drive objects detected.
 116: Recommended clock cycle in r0116[0...1].

General note:

The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).

The parameters of the sampling times can also be changed with automatic calculations.

Example for highest common denominator: 125 μs , 125 μs , 62.5 μs --> 62.5 μs

Remedy:

- check the DRIVE-CLiQ cables.

- set a valid sampling time.

A01224	CU: Pulse frequency inconsistent
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified. Alarm value (r2124, interpret decimal): 1: Value lower than minimum value. 2: Value higher than maximum value. 3: Resulting sampling time is not a multiple of 1.25 µs. 4: Value does not match clock-cycle synchronous PROFIBUS operation. 10: Special restriction of the drive object violated. 99: Inconsistency of cross drive objects detected. 116: Recommended clock cycle in r0116[0...1].
Remedy:	Set a valid pulse frequency. See also: p0113 (Minimum pulse frequency, selection)

F01250	CU: CU-EEPROM incorrect read-only data
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	NONE (OFF2)
Acknowledge:	POWER ON
Cause:	Error when reading the read-only data of the EEPROM in the Control Unit. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON. - replace the Control Unit.

A01251	CU: CU-EEPROM incorrect read-write data
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	Error when reading the read-write data of the EEPROM in the Control Unit. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	For alarm value r2124 < 256, the following applies: - carry out a POWER ON. - replace the Control Unit. For alarm value r2124 >= 256, the following applies: - for the drive object with this alarm, clear the fault memory (p0952 = 0). - as an alternative, clear the fault memory of all drive objects (p2147 = 1). - replace the Control Unit.

F01255	CU: Option Board EEPROM read-only data error
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	NONE (OFF2)
Acknowledge:	POWER ON
Cause:	Error when reading the read-only data of the EEPROM in the Option Board. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON. - replace the Control Unit.
A01256	CU: Option Board EEPROM read-write data error
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	Error when reading the read-write data of the EEPROM in the Option Board. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON. - replace the Control Unit.
F01260	Software not released
Message value:	-
Message class:	Hardware / software error (1)
Drive object:	A_INF, B_INF, CU_I, CU_I_D410, CU_LINK, CU_NX_CX, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: OFF1 Servo: OFF3 Vector: OFF3 Hla: OFF3
Acknowledge:	POWER ON
Cause:	The runtime software (RT-SW) has not been released.
Remedy:	Only for internal Siemens troubleshooting.
F01275	Hardware description error
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	A_INF, B_INF, CU_I, CU_I_D410, CU_LINK, CU_NX_CX, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: OFF2 Servo: OFF3 Vector: OFF3 Hla: OFF3
Acknowledge:	POWER ON
Cause:	An error has occurred while accessing the hardware description file on the CompactFlash card. Directory and file name: ADDON/SINAMICS/DATA/HW_DESC/014/DESC0000.ACX Fault value (r0949, interpret decimal): 22: File not found. 24: File read access error. 26: Format error. 28: Version error.

A01276 Hardware description not fully compatible

Message value: %1

Message class: Hardware / software error (1)

Drive object: A_INF, B_INF, CU_I, CU_I_D410, CU_LINK, CU_NX_CX, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The hardware description file contains more data than the firmware requires.

Remedy: Not necessary.

A01302 Error in the component trace

Message value: %1

Message class: General drive fault (19)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: An error has occurred in the component trace.

The message appears in the following cases:

- upload trace data (p7792 = 1).

- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).

Alarm value (r2124, interpret decimal):

1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).

101: Data from trace 1 cannot be read.

102: Data from trace 2 cannot be read.

103: Data from trace 3 cannot be read.

104: Data from trace 4 cannot be read.

105: Data from trace 5 cannot be read.

Remedy: Re alarm value = 1:

Upgrade the firmware of the DRIVE-CLiQ component involved.

F01303 Component does not support the required function

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.

Fault value (r0949, interpret decimal):

1: The component does not support the de-activation.

101: The Motor Module does not support an internal armature short-circuit.

102: The Motor Module does not support the de-activation.

201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.

202: The Sensor Module does not support parking/unparking.

203: The Sensor Module does not support the de-activation.

- 204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.
 205: The Sensor Module does not support the selected temperature evaluation (r0458).
 206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.
 207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.
 208: The Sensor Module does not support de-selection of commutation with zero mark (via p0430.23).
 211: The Sensor Module does not support single-track encoders (r0459.10).
 212: The Sensor Module does not support LVDT sensors (p4677.0).
 213: The Sensor Module does not support the characteristic type (p4662).

Remedy:

Upgrade the firmware of the DRIVE-CLiQ component involved.
 For fault value = 205:
 Check parameter p0600 and p0601 and if required, adapt interpretation.
 For fault value = 207:
 Replace the power unit or if required set the device supply voltage higher (p0210).
 For fault value = 208:
 Check parameter p0430.23 and reset if necessary.

A01304 (F) Firmware version of DRIVE-CLiQ component is not up-to-date

Message value: %1
Message class: General drive fault (19)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The non-volatile memory has a more recent firmware version than the one in the connected DRIVE-CLiQ component.

Alarm value (r2124, interpret decimal):
 Component number of the DRIVE-CLiQ component involved.
 Update the firmware (p7828, p7829 and commissioning software).

Remedy:

Reaction upon F: NONE
 Acknowl. upon F: IMMEDIATELY

F01305 Topology: Component number missing

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The component number from the topology was not parameterized (p0121 (for power unit, refer to p0107), p0131 (for servo/vector drives, refer to p0107), p0141, p0151, p0161).

Fault value (r0949, interpret decimal):
 Data set number.

Note:

The fault also occurs if encoders have been configured (p0187 to p0189) but no component numbers exist for them. In this case, the fault value includes the drive data set number plus 100 * encoder number (e.g. 3xx, if a component number was not entered in p0141 for encoder 3 (p0189)).

See also: p0121, p0131, p0141, p0142, p0151, p0161, p0186, p0187, p0188, p0189

Remedy:

- enter missing component number.
 - if required, remove the component and restart commissioning.

A01306 Firmware of the DRIVE-CLiQ component being updated

Message value: %1
Message class: General drive fault (19)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: Firmware update is active for at least one DRIVE-CLiQ component.
Alarm value (r2124, interpret decimal):
Component number of the DRIVE-CLiQ component.
Remedy: Not necessary.
This alarm automatically disappears after the firmware has been updated.

A01314 Topology: Component must not be present

Message value: %1, to %2: %3, connection: %4
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: For a component, "de-activate and not present" is set but this component is still in the topology.
Alarm value (r2124, interpret hexadecimal):
ddccbbaa hex:
aa = component number
bb = component class of the component
cc = connection number
Note:
Component class and connection number are described in F01375.
Remedy:
- remove the corresponding component.
- change the setting "de-activate and not present".
Note:
Under "Topology --> Topology view" the commissioning software where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

A01315 Drive object not ready for operation

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: For the active drive object involved, at least one activated component is missing.
Note:
All other active and operational drive objects can be in the "RUN" state.
Remedy: The alarm automatically disappears again with the following actions:
- de-activate the drive object involved (p0105 = 0).
- de-activate the components involved (p0125 = 0, p0145 = 0, p0155 = 0, p0165 = 0).
- re-insert the components involved.

A01316	Drive object inactive and again ready for operation
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	If, when inserting a component of the target topology, an inactive, non-operational drive object becomes operational again. The associated parameter of the component is, in this case, set to "activate" (p0125, p0145, p0155, p0165). Note: This is the only message that is displayed for a de-activated drive object.
Remedy:	The alarm automatically disappears again with the following actions: - activate the drive object involved (p0105 = 1). - again withdraw the components involved. See also: p0105

A01317 (N)	De-activated component again present
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	If a component of the target topology for an active drive object is inserted and the associated parameter of the component is set to "de-activate" (p0125, p0145, p0155, p0165). Note: This is the only message that is displayed for a de-activated component.
Remedy:	The alarm automatically disappears again with the following actions: - activate the components involved (p0125 = 1, p0145 = 1, p0155 = 1, p0165 = 1). - again withdraw the components involved. See also: p0125, p0145, p0155, p0165
Reaction upon N:	NONE
Acknowl. upon N:	NONE

A01318	BICO: De-activated interconnections present
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	This alarm is used in the following cases: - If an inactive/non-operational drive object is active again/ready for operation - If there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) - If the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed
Remedy:	Reset alarm: - Set p9496 to 1 or 2 or - de-activate the drive object again.

A01319 **Inserted component not initialized**

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, CU_LINK, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: Initialization is required for at least one inserted component.
This is only possible if the pulses are inhibited for all the drive objects.

Remedy: Activate pulse inhibit for all drive objects.

A01320 **Topology: Drive object number does not exist in configuration**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: A drive object number is missing in p0978
Alarm value (r2124, interpret decimal):
Index of p0101 under which the missing drive object number can be determined.

Remedy: Set p0009 to 1 and change p0978:
Rules:
- p0978 must include all of the drive object numbers (p0101).
- it is not permissible for a drive object number to be repeated.
- by entering a 0, the drive objects with PZD are separated from those without PZD.
- only 2 partial lists are permitted. After the second 0, all values must be 0.
- dummy drive object numbers (255) are only permitted in the first partial list.

A01321 **Topology: Drive object number does not exist in configuration**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: p0978 contains a drive object number that does not exist.
Alarm value (r2124, interpret decimal):
Index of p0978 under which the drive object number can be determined.

Remedy: Set p0009 to 1 and change p0978:
Rules:
- p0978 must include all of the drive object numbers (p0101).
- it is not permissible for a drive object number to be repeated.
- by entering a 0, the drive objects with PZD are separated from those without PZD.
- only 2 partial lists are permitted. After the second 0, all values must be 0.
- dummy drive object numbers (255) are only permitted in the first partial list.

A01322 **Topology: Drive object number present twice in configuration**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: A drive object number is present more than once in p0978.
Alarm value (r2124, interpret decimal):
Index of p0978 under which the involved drive object number is located.

Remedy: Set parameter p0009 = 1 and change p0978:
Rules:

Component number or connection number: %1, fault cause: %2

Message class:

Error in the parameterization / configuration / commissioning procedure (18)

Drive object:

All objects

Reaction:

NONE

Acknowledge:

IMMEDIATELY

Cause:

For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.

Fault value (r0949, interpret hexadecimal):

xyy hex: x = fault cause, yy = component number or connection number.

1yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.

2yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.

3yy:

Cyclic communication is fully utilized.

4yy:

The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.

The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.

4 Faults and alarms

4.2 List of faults and alarms

5yy:

Internal buffer overflow for net data of a DRIVE-CLiQ connection.

6yy:

Internal buffer overflow for receive data of a DRIVE-CLiQ connection.

7yy:

Internal buffer overflow for send data of a DRIVE-CLiQ connection.

8yy:

The component clock cycles cannot be combined with one another

900:

The lowest common multiple of the clock cycles in the system is too high to be determined.

901:

The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.

Remedy:

- check the DRIVE-CLiQ wiring.

- Reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.

Re fault value = 1yy - 4yy in addition:

- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.

- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

- reduce the function modules (r0108).

- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).

- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.

Re fault value = 8yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.

Re fault value = 9yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

xx = 2: Component in combination with another component not permissible.
Note:

Remedy: Remove the illegal components and restart the system.

F01355 Topology: Actual topology changed

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The device target topology (p0099) does not correspond to the device actual topology (r0098).
The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning software.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
See also: r0098 (Actual device topology), p0099 (Device target topology)
Remedy: One of the following counter-measures can be selected if no faults have occurred in the topology detection itself:
If commissioning is still not completed:
- carry out a self-commissioning routine (starting from p0009 = 1).
In general:
Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107).
Generating servo drives: Set p0097 to 1, set p0009 to 0.
Generating vector drives: Set p0097 to 2, set p0009 to 0.
Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0.
In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).
If commissioning has already been completed:
- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning software).
Notice:
Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning software and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

yyxx hex:
yy = connection number of the Control Unit at which the second Control Unit is connected
xx = component number of the Control Unit at which the second Control Unit is connected
Note:
Pulse enable is withdrawn and prevented.
Remedy:
- remove the DRIVE-CLiQ connection, restart the systems, install OALINK on both Control Units and commission.
- remove the connection to the second Control Unit and restart.
- for the S120M component DRIVE-CLiQ extension, interchange the hybrid cable (IN/OUT).

Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2

- 6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

Remedy:

Re fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the tolerance time F-DI changeover and if required, increase the value (p9650/p9850).

Re fault value = 1001, 1002:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 1900, 1901, 1902:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

Re fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the tolerance time SGE changeover and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (power off/on) for all components.

Check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.

- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.

Check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.

- evaluate diagnostic information in the F host.

- check PROFIsafe connection.

Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).

90:
Brake released for service purposes (X4).

Remedy:

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
 - for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015).
 - select Safe Torque Off and de-select again.
 - check the motor holding brake connection.
 - check the function of the motor holding brake.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
 - replace the Motor Module involved.
- Operation with Safe Brake Module or Safe Brake Adapter:
- check the Safe Brake Module or Safe Brake Adapter connection.
 - Replace the Safe Brake Module or Safe Brake Adapter.

Cause:

A configuration of motor holding brake and SBC was detected that is not practical.

The following configurations can result in this message:

- "No motor holding brake available" (p1215 = 0) and "SBC" enabled (p9602 = 1).
- "Motor holding brake just like the sequence control, connection via BICO" (p1215 = 3) and "SBC" enabled (p9602 = 1).

Note:

SBC: Safe Brake Control

Remedy:

Check the parameterization of the motor holding brake and SBC and correct.

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- The current controller sampling time is set to zero (p0115[0]).

Remedy:

For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):

- Upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to p9511 = 0.

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).

- for motion monitoring functions integrated in the drive (p9601/p9801bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in p9511/p9311.

Re fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.

- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 μ s. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.

- increase the DP clock cycle for operation with a clock-cycle synchronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.

- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500 / p9300).

For fault value = 107:

- Set an actual value sensing clock cycle that matches the current controller clock cycle (p9511 \geq 4 * p0115[0], 8 * p0115[0]) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).

The following applies to SINAMICS S110:

- set the actual value sensing clock cycle to p9511 = 250 μ s.

For fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

Re fault value = 200, 201:

- Increase the current controller sampling time (p0115[0]).

- If required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- Set the current controller sampling time to a sensible value (p0115[0]).

F01652**SI P1 (CU): Illegal monitoring clock cycle**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

One of the Safety Integrated monitoring clock cycles is not permissible.

- the monitoring clock cycle integrated in the drive cannot be maintained due to the communication conditions required in the system.

- the monitoring clock cycle for safe motion monitoring functions is not permissible (p9500).

- the actual value sensing clock cycle for safe motion monitoring functions is not permissible (p9511).

- The sampling time for the current controller (p0112, p0115[0]) cannot be supported.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

For motion monitoring functions that are not enabled (p9601.2 = p9801.2 = 0, p9501 = 0), the following applies:

- Minimum setting for the monitoring clock cycle (in μ s).

For motion monitoring functions that are enabled (p9601.2 = p9801.2 = 1 and/or p9501 > 0), the following applies:

100:

- No matching monitoring clock cycle was able to be found.

- an illegal actual value sensing clock cycle was set for S120M (p9511).

101:

- The monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle.

102:

- An error has occurred when transferring the actual value sensing clock cycle to the Hydraulic Module.

103:

- An error has occurred when transferring the actual value sensing clock cycle to the Sensor Module.

104, 105:

- four times the current controller sampling time (p0115[0]) is greater than 1 ms when operating with a non-isochronous PROFIBUS.

- four times the current controller sampling time (p0115[0]) is greater than the DP clock cycle when operating with an isochronous PROFIBUS.

- The DP clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

106:

- The monitoring clock cycle does not match the monitoring clock cycle of the TM54F.

107:

- The actual value sensing clock cycle (p9511) is less than four times the current controller sampling time (p0115[0]).

- The actual value sensing clock cycle (p9511) is not an integer multiple of the sampling time of the current controller (p0115[0]).

108:

- The parameterized actual value sensing clock cycle cannot be set on this component

111:

- The monitoring clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

112:

- an actual value sensing clock cycle p9511 = 0 is not permissible in this configuration.

202:

- The current controller sampling time is set to zero (p0115[0]).

Remedy:

For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):

- Upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to p9511 = 0.

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).
- for motion monitoring functions integrated in the drive (p9601/p9801bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in p9511/p9311.

Re fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.
- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.
- increase the DP clock cycle for operation with a clock-cycle synchronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.
- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500 / p9300).

For fault value = 107:

- Set an actual value sensing clock cycle that matches the current controller clock cycle (p9511 $\geq 4 * p0115[0]$, $8 * p0115[0]$) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.
- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).
- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 202:

- Set the current controller sampling time to a sensible value (p0115[0]).

Message class:	General drive fault (19)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The simulation of the digital inputs of the Control Unit (p0795) is active. It is not permissible that safety inputs are simulated. Fault value (r0949, interpret binary): The displayed bits indicate which digital inputs must not be simulated.
Remedy:	- Deactivate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795). - acknowledge fault.

Cause:	<p>In p9700, the value 87 or 208 is saved or was entered offline.</p> <p>This is the reason that when booting, an attempt is made to copy SI parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected on monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons.</p> <p>As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages.</p> <p>Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.</p> <p>Note:</p> <p>This fault does not result in a safety stop response.</p> <p>See also: p9700 (SI Motion copy function)</p>
Remedy:	<p>- Set p9700 to 0.</p> <p>- Check p9501 and p9601 and if required, correct.</p> <p>- Restart the copying function by entering the corresponding value into p9700.</p> <p>Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:</p> <ul style="list-style-type: none">- Call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").- Click on "Change settings".- Click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).- save all parameters (p0977 = 1 or "copy RAM to ROM").- carry out a POWER ON (power off/on) for all components.

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE

Cause:	A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds. If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgement (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The parameterization of a Sensor Module used for Safety Integrated is not permissible. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): 1: No encoder was parameterized for Safety Integrated. 2: An encoder was parameterized for Safety Integrated that does not have an A/B track (sine/cosine). 3: The encoder data set selected for Safety Integrated is still not valid. 4: A communication error with the encoder has occurred. 5: Number of relevant bits in the encoder coarse position invalid. 6: DRIVE-CLiQ encoder configuration invalid. 7: Non-safety relevant component of the encoder coarse position for the linear DRIVE-CLiQ encoder not valid. 8: Parameterized Safety comparison algorithm not supported. 9: Relationship between the grid division and measuring step for linear DRIVE-CLiQ encoder is not binary. 10: For an encoder used for Safety Integrated, not all of the Drive Data Sets (DDS) are assigned to the same Encoder Data Set (EDS) (p0187 ... p0189). 11: The zero point setting of a linear DRIVE-CLiQ encoder used in Safety Integrated is not zero. 12: The second encoder is not parameterized. 13: Hydraulic Module: A second encoder has not been parameterized and a DRIVE-CLiQ encoder is not being used.
Remedy:	Re fault value = 1, 2: - use and parameterize an encoder that Safety Integrated supports (encoder with track A/B sine-wave, p0404.4 = 1). For fault value = 3: - check whether the drive or drive commissioning function is active and if required, exit this (p0009 = p00010 = 0), save the parameters (p0971 = 1) and carry out a POWER ON For fault value = 4: - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Sensor Module involved and if required, carry out a diagnostics routine for the faults identified. For fault value = 5: - p9525 = 0 (not permissible). Check the encoder parameterization on the Sensor Modules involved. Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	At least one enabled "Safety Cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position. The following conditions must be complied with to assign cams to a cam track: - the cam length of cam x = p9536[x]-p9537[x] must be greater or equal to the cam tolerance + the position tolerance (= p9540 + p9542). This also means that for cams on a cam track, the minus position value must be less than the plus position value. - the distance between 2 cams x and y (minus position value[y] - plus position value[x] = p9537[y] - p9536[x]) on a cam track must be greater than or equal to the cam tolerance + position tolerance (= p9540 + p9542). Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): Number of the "Safe Cam" with an illegal position. Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: POWER ON

Cause: The axis configuration was changed (e.g. changeover between linear axis and rotary axis).
Parameter p0108.13 is internally set to the correct value.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Parameter number of parameter that initiated the change.

See also: p9502 (SI Motion axis type (Control Unit))

Remedy: The following should be carried out after the changeover:

- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Once the Control Unit has been switched on, safety message F01680 or F30680 indicates that the checksums in r9398[0] and r9728[0] have changed in the drive. The following must, therefore, be carried out:

- activate safety commissioning mode again.
- complete safety commissioning of the drive.
- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Note:

For the commissioning software, the units are only consistently displayed after a project upload.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

0: There is no physical NVRAM available in the drive.

1: There is no longer any free memory space in the NVRAM.

Remedy: For fault value = 0:
 - use a Control Unit NVRAM.
 For fault value = 1:

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions.
 Isochronous PROFIBUS:
 The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To.
 No isochronous PROFIBUS:
 The DP clock cycle must be at least 4x the current controller clock cycle.
Notice:
 If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.

Remedy: Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time.
 Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0):
 Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual values sensing clock cycle must be at least 4x the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.

Cause:	A Sensor Module, which is used for safe motion monitoring functions, was replaced. The hardware replacement must be acknowledged. An acceptance test must be subsequently performed. Note: This message does not result in a safety stop response.
Remedy:	Carry out the following steps using the STARTER commissioning software: - press the "Acknowledge hardware replacement" button in the safety screen form. - execute the function "Copy RAM to ROM". - carry out a POWER ON (power off/on) for all components.

As an alternative, carry out the following steps in the expert list of the commissioning software:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

Then carry out an acceptance test (refer to the Safety Integrated Function Manual).

Cause: The time set in p9559 for the forced checking procedure of the safety motion monitoring functions has been exceeded. A new test is required.

After next selecting the forced checking procedure parameterized in p9705, the message is withdrawn and the monitoring time is reset.

Note:

- This message does not result in a safety stop response.

- As the shutdown paths are not automatically checked during booting, an alarm is always issued once booting is complete.

- The test must be performed within a defined, maximum time interval (p9559, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

Cause: The time set in p9659 for the forced checking procedure of the safety shutdown paths has been exceeded. The safety shutdown paths must be re-tested.

After the next time the "STO" function is de-selected, the message is withdrawn and the monitoring time is reset.

Note:

- This message does not result in a safety stop response.

- The test must be performed within a defined, maximum time interval (p9659, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value).

Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

42: Shutdown speed, STO (p9560/p9360)

43: Memory test, stop response (STOP A).

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).

47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).

48: Position actual value (r9713[0/1]) + limit value SLS3 (p9531[2]/p9331[2]) * safety monitoring clock cycle (p9500/p9300).

49: Position actual value (r9713[0/1]) - limit value SLS3 (p9531[2]/p9331[2]) * safety monitoring clock cycle (p9500/p9300).

5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140: An internal software error has occurred (only for internal Siemens troubleshooting).

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

5025: The result of the F parameterization is different for the two controllers.

5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.

5065: A communications error was identified when receiving the PROFIsafe telegram.

5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

Re message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

Re message value = 3:

Commissioning phase:

- Encoder evaluation for own or second channel has been set incorrectly --> Correct the encoder evaluation.

In operation:

- Check the mechanical design and the encoder signals.

- If closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).

Re message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

Re message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

Re message value = 232:

- Increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

Re message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the CDC list is increased when setting p9567 > 0 . For a non-compatible version of SINUMERIK this can lead to an error for the crosswise data comparison (is indicated with message value ≥ 237). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

Re message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

Re message value = 1001:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

Re message value = 1002:

- Perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

Re message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- Increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

Re message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

Re message value = 1005:

- For safe motion monitoring functions without encoder: check the conditions for pulse enable.

- For safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a power module, the test stop should always be performed for pulse enable (independent of whether with encoder or without encoder).

Re message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

Re message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

Re message value = 1011:

- for diagnostics, refer to parameter (r9571).

Re message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- For a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- For DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (power off/on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

Re message value = 1020, 1021, 1024:

- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (power off/on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

Re message value = 1033:

- If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

Re message value = 1039:

- Check the conversion factors such as spindle pitch or gearbox ratios.

Re message value = 1041:

- Check whether the motor has sufficient current (>r9785[0]).
- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- Check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

Re message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- Check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
- increase the minimum current (p9588/p9388).

Re message value = 1043:

- increase the voltage tolerance (p9589).
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

Re message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

Re message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

Re message value = 5013, 5025:

- carry out a POWER ON (power off/on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

Re message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F_SIL, F_CRC_Length, F_Par_Version, F_Source_Add, F_Dest_add, F_WD_Time).

Re message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

Re message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

Re message value = 5066:

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

Re message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

Re message value = 7000:

- Increase the position tolerance (p9542/p9342).
- Determine the actual position of CU (r9713[0] and the second channel r9713[1], and check the difference for plausibility.
- Reduce the difference of the actual position from CU (r9713[0] and the second channel r9713[1] for a 2-encoder system.

Re message value = 7001:

- Increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- If required, reduce the traversing range.

Re message value = 7002:

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

C01711	SI Motion P1 (CU): Defect in a monitoring channel
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	HLA
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	<p>When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.</p> <p>If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.</p> <p>The message value that resulted in a STOP F is displayed in r9725.</p> <p>If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:</p> <p>1007: communication error with the PLC (sign-of-life)</p> <p>1008: communication error with the PLC (CRC)</p>

The following described message values involve the crosswise data comparison between the two monitoring channels (safety functions integrated in the drive).

The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- cycle times not set uniformly (p9500/p9300 and p9511/p9311)
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- for message values 3, 44 ... 57, 232 and 1-encoder systems, differently parameterized encoder values (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

Message values that are not subsequently listed are only for internal Siemens troubleshooting.

0: Stop request from the other monitoring channel.

1: Status image of monitoring functions SOS, SLS or SLP (result list 1) (r9710[0], r9710[1]).

2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]).

3: The position actual value differential (r9713[0/1]) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.

4: Error when synchronizing the crosswise data comparison between the two channels.

5: Function enable signals (p9501/p9301) Safety monitoring clock cycle too small (p9500/p9300).

6: Limit value for SLS1 (p9531[0]/p9331[0])

7: Limit value for SLS2 (p9531[1]/p9331[1])

38: Trans. time STOP D to SOS (p9553/p9353)

39: Trans. time, STOP E to SOS (p9554/p9354)

40: Stop response for SLS (p9561/p9361)

41: Stop response for SLP1 (p9562[0]/p9362[0])

42: Shutdown speed, STO (p9560/p9360)

43: Memory test, stop response (STOP A).

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).

47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).

- 271: Screen form for SGE image: Deselect all bits for the "Safe gearbox switchover" function
- 272: Activation of the increased position tolerance for the "Safe gearbox switchover" function different
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:
User agreement after the timer has expired different.
The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:
Reference tolerance exceeded.
When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:
Plausibility error for user agreement.
1. If the user agreement has already been set, then setting is initiated again. In this case, the user agreement is withdrawn.
2. The user agreement was set, although the axis has still not been referenced.
- 1005: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.
- 1012: Plausibility violation of the actual value from the encoder.
- 1015: Gearbox switchover (bit 27 in PROFIsafe Telegram (takes longer than 2 min.
- 1020: Cyc. communication failure between the monit. cycles.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

Re message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for HM: C30711).

Re message value = 3:

Commissioning phase:

- Encoder evaluation for own or second channel has been set incorrectly --> Correct the encoder evaluation.

In operation:

- Check the mechanical design and the encoder signals.

Re message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with HM: C30711), the monitoring clock cycle settings must be increased.

Re message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

Re message value = 232:

- Increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

Re message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (power off/on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the CDC list is increased when setting $p9567 > 0$. For a non-compatible version of SINUMERIK this can lead to an error for the crosswise data comparison (is indicated with message value ≥ 237). If necessary, $p9567$ must be set = 0, or the firmware version of SINUMERIK upgraded.

Re message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

Re message value = 1001:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

Re message value = 1002:

- Perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

Re message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- Increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

Re message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

Re: message value = 1005: deselect checking the conditions for STO.

Re message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

Re message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

Re message value = 1011:

- for diagnostics, refer to parameter (r9571).

Re message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.

- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- For a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.

- For DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- check the electrical cabinet design and cable routing for EMC compliance

- carry out a POWER ON (power off/on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).

- replace the hardware.

Re message value = 1020, 1021, 1024:

- check the communication link.

- increase the monitoring cycle clock settings (p9500, p9511).

- carry out a POWER ON (power off/on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).

- replace the hardware.

Re message value = 1033:

- If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

Re message value = 1039:

- Check the conversion factors such as spindle pitch or gearbox ratios.

Re message value = 1041:

- Check whether the motor has sufficient current (>r9785[0]).

- reduce the minimum current (p9588).

- for synchronous motors increase the absolute value of p9783.

- Check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

Re message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).

- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.

- Check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.

- increase the minimum current (p9588/p9388).

Re message value = 1043:

- increase the voltage tolerance (p9589).

- increase the ramp-function generator ramp-up/down time (p1120/p1121).

- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

Re message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

Re message value = 5013, 5025:

- carry out a POWER ON (power off/on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

Re message value = 5022:

Remedy:	<p>Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs. - check the wiring of the F-DI (contact problems).</p> <p>Note: This message can be acknowledged via F-DI or PROFIsafe. Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked: - $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10002 \geq p9500$ (discrepancy time must be no less than p9500) - $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply) td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9500). tp = period for a switching operation in ms. When debounce p10017 is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p10002 < p10017 + 1 \text{ ms} - td$ - $p10002 > td$ - $p10002 \geq p9500$</p> <p>Example: For a 12 ms SI monitoring cycle and a switching frequency of 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows: $p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$ Rounded-off, p10002 \leq 36 ms is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).</p> <p>Note: F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output</p>

Example:

Fault F01773 (CU) is signaled with fault value = 0001_0127 and fault F30773 (MM) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

Remedy:

Check the wiring of the F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

In the event of multiple test stop faults, the first one that occurred is shown.

Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

SI Motion P1 (CU): Test stop necessary

Message value:

-

Message class:

Safety monitoring channel has identified an error (10)

Drive object:

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

NONE

Acknowledge:

NONE

Cause:

- after powering up the drive, a test stop has still not been carried out.
- a new test stop is required after commissioning.
- the time to carry out the forced checking procedure (test stop) has expired (p10003).

Note:

- The test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

Remedy:

Initiate test stop (Bl: p10007).

Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The maximum time (11 s) to open the brake during the brake test was exceeded. Possible causes: - during the brake test the drive went into a fault condition, and therefore the brake was closed by the drive. - for an external brake, the feedback signal "Brake closed" was signaled too long (p10230.5, p10235). Alarm value (r2124, interpret binary): Bit 0 = 1: Internal brake was not able to be opened. Bit 1 = 1: External brake was not able to be opened. Note: SBT: Safe Brake Test
Remedy:	- Carry out a safe acknowledgment. - restart the brake test (p10230.1, p10235.1). See also: p10230 (SI Motion SBT control word), p10235 (SI Safety Control Channel control word S_STW3B)

A01782	SBT brake test incorrect control
Message value:	Fault cause: %1 bin
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The brake test was canceled as a result of incorrect control. Alarm value (r2124, evaluate binary): Alarm value 0: The brake test was canceled as a result of a fault (brake opening time or brake closing time exceeded). Bit 0: The safe brake test was canceled by resetting the brake test selection. Bit 1: The safe brake test was canceled by resetting the brake test start.

Bit 2:

The brake, which was selected at the start of the brake test, has not been configured in p10202.
When starting the brake test, as a result of the test top selection, brake 1 is not configured as internal brake.
There is a brake test configuration error. In this case, alarm A01785 is also output.

Note:

SBT: Safe Brake Test

See also: p10202 (SI Motion SBT brake selection)

- Remedy:**
- Check parameterization of the brake test (p10202).
 - Check as to whether alarm A01785 is present, and if so, evaluate.
 - Carry out a safe acknowledgment.
 - If required, restart the brake test.
-

Bit 0 = 1:

Internal brake was not able to be closed.

Bit 1 = 1:

External brake was not able to be closed.

Note:

SBT: Safe Brake Test

- Remedy:**
- When using an external brake, check that the feedback signal "brake closed" is correctly interconnected with the control word of the brake test (p10230.5, p10235.5).
 - When using an internal brake with external feedback signal, check whether the feedback signal is correctly interconnected with the extended brake control.
 - Carry out a safe acknowledgment.
 - restart the brake test (p10230.1, p10235.1).

Message value: Fault cause: %1 bin

Message class: Safety monitoring channel has identified an error (10)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The safe brake test was canceled as a result of a fault.

Alarm value (r2124, interpret binary):

Bit 17 = 1: fault in the brake test sequence (cause, see bits 0 ... 10).

Bit 18 = 1: the internal brake is closed. It must be open when the external brake is tested (p10202).

Bit 19 = 1: the external brake is closed. It must be open when the internal brake is tested (p10202).

Bit 20 = 1: not all brakes are open (p10202).

Bit 21 = 1: axis position during the brake test not valid due to parking axis.

Bit 22 = 1: internal software error.

Bit 23 = 1: the permissible position range of the axis was violated with the brake closed (p10212/ p10222).

Bit 24 = 1: the tested internal brake was opened while the brake test was active.

Bit 25 = 1: the tested external brake was opened while the brake test was active.

Bit 26 = 1: during the active brake test, the test torque left its tolerance bandwidth (20 %).

Cause for alarm value bit 17:

Bit 0 = 1: operation when selecting the brake test not enabled (r0899.2 = 0).

Bit 1 = 1: external fault occurred (e.g. the brake test that has already started is canceled by the user).

Bit 2 = 1: when selecting the brake test a brake is closed.

Bit 3 = 1: when determining the load torque a brake is closed.

Bit 4 = 1: a fault with a stop response has occurred (e.g.. OFF1, OFF2 or OFF3).

Bit 5 = 1: when selecting the brake test the axis speed setpoint is too high.

Bit 6 = 1: the actual speed (r0063) of the axis is too high (e.g. brake does not hold during the brake test).

Bit 7 = 1: incorrect speed controller mode (e.g. encoderless speed control or U/f operation).

Bit 8 = 1: closed-loop control not enabled or function generator active.

Bit 9 = 1: control does not switch over to the brake test (e.g. because PI speed control has not been parameterized).

Bit 10 = 1: torque limit reached (r1407.7, r1408.8).

Note:

SBT: Safe Brake Test

Remedy:

- Remove the fault cause.

- Carry out a safe acknowledgment.

- If required, restart the brake test.

Re bit 17 = 1 with bit 6 = 1 or bit 23 = 1:

If the brake closing time of the motor holding brake (p1217) has been set too low, then at the start of the brake test, the brake is closed too late. The brake closing time should be adapted (p1217).

Message value: -
Message class: Safety monitoring channel has identified an error (10)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The STO function is selected via Safety Extended Functions or a safety message is present, which results in STO. The automatic test stop was not able to be carried out since the power up. The automatic test stop is performed after deselecting STO.
Remedy: Deselect STO via Safety Extended Functions.
Remove the cause of the safety message and acknowledge the fault.

A01789 Automatic test stop and brake test not permitted when test stop is selected

Message value: -
Message class: Safety monitoring channel has identified an error (10)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The parameterization of the automatic test stop (p9507.6/p9307.6) and the brake test when a test stop is selected (p10203 = 2) is not permissible. The test stop is not automatically carried out when the powering up.
Remedy: - correct the parameter assignment.
- set p10203 not equal to 2 or deactivate the automatic test stop.
Note:
A warm restart or POWER ON is required to carry out the automatic test stop.

A01794 (N) SI MOTION: check modulo value for safe position via PROFIsafe

Message value: -
Message class: Hardware / software error (1)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows.
Range that can be represented:
- 32-bit value: +/- 2048 revolutions
- 16-bit value: +/- 2048 revolutions (depending on p9574)

Remedy:	Correct the parameter assignment. Set p9505 to 2 ⁿ revolutions - and to complete revolutions (i.e. a multiple of 360 °). Note: This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of +/- 2048 revolutions that can be represented. To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization: - correct p9505 to "2 ⁿ ". - re-parameterize the alarm using p2118 and p2119. - set p9505 back to the required value.

Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	After exiting safe pulse cancellation, within the wait time of 5 seconds, encoderless actual value sensing was not able to be activated for the extended functions without selection. A change is again made into the "safe pulse cancellation" state.
Remedy:	- Check missing enable signals, which prevent the drive control from being commissioned (r0046). - Evaluate possible fault messages of the encoderless actual value sensing and remove.

Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The drive waits for communication to be established to execute the safety-relevant motion monitoring functions. Note: STO is active in this state. Alarm value (r2124, interpret decimal): 1: Wait for communication to be established to SINUMERIK. 2: Wait for communication to be established to TM54F. 3: Wait for communication to be established to PROFIsafe F-Host.
Remedy:	If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate: For communication with SINUMERIK, the following applies: - check any other PROFIBUS messages/signals present and remove their cause. - check that assignment of the axes on the higher-level control to the drives in the drive unit is correct. - check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it. For communication with TM54F, the following applies: - check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause. - check the setting of p10010. All the drive objects controlled by the TM54F must be listed.

4 Faults and alarms

4.2 List of faults and alarms

For communication with PROFIsafe F-Host, the following applies:

- Check any other PROFIsafe communication messages/signals present and evaluate them.
- check the operating state of the F-Host.
- Check the communication connection to the F Host.
- Check the communication connection to the Motor Module/Hydraulic Module. It must be ensured that when the Control Unit powers up, the Motor Module/Hydraulic Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module/Hydraulic Module is subsequently inserted or switched-on, a POWER ON must be performed at the Control Unit.

Cause: A DRIVE-CLiQ connection fault has occurred.
Fault value (r0949, interpret decimal):
100 ... 107:
Communication via DRIVE-CLiQ socket X100 ... X107 has not been switched to cyclic operation. The cause may be an incorrect structure or a configuration that results in an impossible bus timing.
10:
Loss of the DRIVE-CLiQ connection. The cause may be, for example, that the DRIVE-CLiQ cable was withdrawn from the Control Unit or as a result of a short-circuit for motors with DRIVE-CLiQ. This fault can only be acknowledged in cyclic communication.
11:
Repeated faults when detecting the connection. This fault can only be acknowledged in cyclic communication.
12:
A connection was detected but the node ID exchange mechanism does not function. The reason is probably that the component is defective. This fault can only be acknowledged in cyclic communication.

Remedy: Re fault value = 100 ... 107:
- ensure that the DRIVE-CLiQ components have the same firmware versions.
- avoid longer topologies for short current controller clock cycles.
For fault value = 10:
- check the DRIVE-CLiQ cables at the Control Unit.
- remove any short-circuit for motors with DRIVE-CLiQ.
- carry out a POWER ON.
For fault value = 11:

Reaction:	NONE
Acknowledge:	NONE
Cause:	The drive unit did not accept the receive configuration data. Alarm value (r2124, interpret decimal): Return value of the receive configuration data check. 1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978. 2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051. 3: Uneven number of bytes for input or output. 4: Setting data for synchronization not accepted. For more information, see A01902. 5: Cyclic operation not active. 501: PROFIsafe parameter error (e.g. F_dest). Additional values: Only for internal Siemens troubleshooting.
Remedy:	Check the receive configuration data. Re alarm value = 1, 2: Check the list of the drive objects with process data exchange (p0978). With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange. Re alarm value = 2: Check the number of data words for output and input to a drive object. Re alarm value = 501: Check the set PROFIsafe address (p9610).

A02041 Function generator: Illegal value for bandwidth

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high. Depending on the time slice clock cycle, the bandwidth is defined as follows:

$\text{Bandwidth_max} = 1 / (2 \times \text{time slice clock cycle})$

$\text{Bandwidth_min} = \text{Bandwidth_max} / 100000$

Example:

Assumption: p4830 = 125 μs

--> $\text{Bandwidth_max} = 1 / (2 \times 125 \mu\text{s}) = 4000 \text{ Hz}$

--> $\text{Bandwidth_min} = 4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$

Note:

p4823: Function generator bandwidth

p4830: Function generator time slice clock cycle

See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)

Remedy: Check the value for the bandwidth and adapt accordingly.

Note:

The alarm is reset as follows:

- remove the cause of this alarm.
 - restart the function generator.

Note:
The alarm automatically disappears when stopping, or when successfully starting the variable message function (p3290.0).

A02095 MTrace 0: multiple trace cannot be activated

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 0):
- measuring function
- long-time trace
- trigger condition "immediate recording start" (IMMEDIATE)
- trigger condition "start with function generator" (FG_START)
Remedy: - if required, deactivate the multiple trace (p4840[0] = 0).
- deactivate function or setting that is not permissible
See also: p4840 (MTrace cycle number setting)

A02096 MTrace 0: cannot be saved

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0).
A multiple trace is not started or is canceled.
Alarm value (r2124, interpret decimal):
1: Memory card cannot be accessed.
- card is not inserted or is blocked by a mounted USB drive.
3: data save operation too slow.
- a second trace has been completed before the measurement results of the first trace were able to be saved.
- writing the measurement result files to the card is blocked by the parameter save.
4: Data save operation canceled.
- for instance, the file required for the data save operation was not able to be found.
See also: p4840 (MTrace cycle number setting)
Remedy: - insert or remove the memory card.
- use a larger memory card.
- configure a longer trace time or use an endless trace.
- avoid saving parameters while a multiple trace is running.
- check whether other functions are presently accessing measurement result files.

A02099 Trace: Insufficient Control Unit memory

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The memory space still available on the Control Unit is no longer sufficient for the trace function.
Remedy: Reduce the memory required, e.g. as follows:
- reduce the trace time.
- increase the trace clock cycle.
- reduce the number of signals to be traced.
See also: r4708 (Trace memory space required), r4799 (Trace memory location free)

A02100	Drive: Computing dead time current controller too short

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The value in p0118 produces a dead time of one clock cycle because it is prior to setpoint availability. Possible causes: - A parameter backup with a version higher than 4.3 was loaded to a version less than or equal to 4.3. - The system properties after replacing a component no longer match the parameter assignment. Alarm value (r2134, floating point): Minimum value for p0118 where dead time no longer occurs.
Remedy:	- set p0118 to zero. - set p0118 to a value greater than or equal to the alarm value (for p1810.11 = 1) - set p0117 (from the device) to an automatic setting (p0117 = 1). - check the firmware versions of the components involved. The action p7770 = 1 is not supported by this version if Drive Control Chart (DCC) is activated for the drive object concerned.

yy = 2:

The data length of the specified application is not the same in the NVRAM and the backup.

yy = 3:

The data checksum in p7774 is not correct.

yy = 4:

No data available to load.

See also: p7770 (NVRAM action)

Remedy:

- Perform the remedy according to the results of the troubleshooting.
- If necessary, start the action again.

F03001 NVRAM checksum incorrect

Message value: %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: A checksum error occurred when evaluating the non-volatile data (NVRAM) on the Control Unit.
The NVRAM data affected was deleted.
Remedy: Carry out a POWER ON (power off/on) for all components.

F03500 (A) TM: Initialization

Message value: %1
Message class: Hardware / software error (1)
Drive object: All objects
Reaction: OFF1 (OFF2)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: When initializing the Terminal Modules, the terminals of the Control Unit or the Terminal Board 30, an internal software error has occurred.
Fault value (r0949, interpret decimal):
yxxx dex
y = Only for internal Siemens troubleshooting
xxx = component number (p0151)
Remedy:
- power down/power up the power supply for the Control Unit.
- check the DRIVE-CLiQ connection.
- if required, replace the Terminal Module.
The Terminal Module should be directly connected to a DRIVE-CLiQ socket of the Control Unit.
If the fault occurs again, replace the Terminal Module.

Fault value (r0949, interpret decimal):
Note:
For the following analog input type, the wire breakage monitoring is active:
p0756[0] = 3 (4 ... 20 mA with monitoring)

- Remedy:**
- Check the wiring to the signal source for interruptions.
 - Check the magnitude of the injected current - it is possible that the infed signal is too low.
 - Check the load resistor (250 Ohm).

Note:

The input current measured by the analog input can be read in r0752[0].

For p756[0] = 3 (unipolar current input monitored (+4 ... +20 mA)) the following applies:

A current less than 4 mA is not displayed in r752[0] - but instead r752[0] = 4 mA is output.

F06000	Infeed: Precharging monitoring time expired
Message value:	-
Message class:	Infeed faulted (13)
Drive object:	A_INF, B_INF, R_INF, S_INF
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857). The end of the DC link pre-charging was not able to be completed for one of the following reasons: 1) There is no line supply voltage connected. 2) The line contactor/line side switch has not been closed. 3) The line supply voltage is too low. 4) Line supply voltage incorrectly set (p0210). 5) The pre-charging resistors are overheated as there were too many pre-charging operations per time unit. 6) The pre-charging resistors are overheated as the DC link capacitance is too high. 7) The pre-charging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link. 8) The pre-charging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module. 9) The DC link has either a ground fault or a short-circuit. 10) The pre-charging circuit is possibly defective (only for chassis units). See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)
Remedy:	In general: - check the line supply voltage at the connecting terminals. - check the line supply voltage setting (p0210). - check the monitoring time and, if required, increase (p0857). - where relevant, observe additional power unit messages/signals (e.g. F30027). - the following applies to booksize units: Wait (approx. 8 min.) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply. Re 5): - carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual). Re 6): - check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual) Re 7): - interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link Re 8): - check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge. Re 9): - check the DC link for ground faults or short circuits.

Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	In operation, the pulse enable via terminal EP at the Line Module (X21.3, X21.4) was withdrawn. Note: EP: Enable Pulses (pulse enable)
Remedy:	- do not open the line side switch in operation - only when the pulses are inhibited. - check the wiring of terminal EP (X21.3, X21.4) at the Line Module to exclude any poor contacts.

Drive object:	A_INF, R_INF, S_INF
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The power unit does not support the Smart Mode.
Remedy:	<ul style="list-style-type: none"> - set the suitable sampling time $250 \mu\text{s} \leq p0115[0] \leq 400 \mu\text{s}$ (e.g. by setting p0112 and p0115 to the factory setting). - upgrade the power unit software and/or hardware for the Smart Mode. The availability of the Smart Mode function is displayed in r0192. - for A_INF the following applies: De-activate the Smart Mode with p3400.0 = 0 and activate the voltage control with p3400.3 = 1. For booksize power units, it must be noted that for a supply voltage $p0210 > 415 \text{ V}$ only the Smart Mode is possible in the pre-setting. If DC link voltages above 660 V are permissible in the application, then voltage-controlled operation can be activated with p0280, p0210, p3400 and p3510. F06200 Infeed: One or several line phases failed

Message value:	-
Message class:	Network fault (2)
Drive object:	A_INF, R_INF, S_INF
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	Failure overvoltage in one or several line supply phases. The fault can be output in two operating states: 1. During the power-on phase of the infeed unit. The measured line supply angle deviates from the regular characteristic for a 3-phase system - the PLL cannot be synchronized. The fault occurs immediately after power-up if, when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit. 2. While the infeed is operational. After a voltage dip has been detected or an overvoltage (note A06205) in one or several line phases a fault occurred within 100 ms (also refer to other relevant messages). Generally, before fault message F06200 is output, Alarm A06205 occurs at least once, whose warning value can provide information regarding the cause of the line supply fault. Possible causes: - voltage dip on the line side or phase failure or overvoltage lasting longer than 10 ms. - overload condition on the load side with peak current. - line reactor missing.
Remedy:	- check the line supply and fuses. - check the connection and size (rating) of the line reactor. - check and correct the phase assignment at the VSM (X521 or X522) and at the power unit. - check the load. - if failed in operation, carefully note the previous alarm messages A6205 with alarm values. Message value: %1
Message class: Ground fault / inter-phase short-circuit detected (7)
Drive object: A_INF, R_INF, S_INF
Reaction: OFF2 (OFF1)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The smoothed total of the phase currents ($i_1 + i_2 + i_3$) is greater than 4 % of the maximum power unit current (r0209).
Possible causes:
- the DC link has a ground fault that results in a high summation current (r0069.6). The DC component in the line currents can damage/destroy the power unit, line reactor or line filter!
- the zero point calibration of the current measurement was not carried out (p3491, A06602).
- defective current measurement in the power unit.
Fault value (r0949, floating point):
Smoothed total of the phase currents.

Remedy:

- check the DC link for a low-ohmic or high-ohmic ground fault and if present, remove.
- increase the monitoring time of the current offset measurement (p3491).
- replace the power unit if necessary.

A06250 (F, N) Infeed: Defective capacitor(s) in at least one phase of line filter

Message value: %1

Message class: Line filter faulted (15)

Drive object: A_INF, R_INF, S_INF

Reaction: NONE

Acknowledge: NONE

Cause: A change in the line filter capacitance was detected in at least one line phase.
The voltages and phase currents of the line filter, measured using a Voltage Sensing Module (VSM), indicate a deviation of the filter capacitances from the value parameterized in p0221.
A change or a defect of the line filter capacitors results in a shift of the resonant frequencies and can result in severe damage to the drive system.

Alarm value (r2124, floating point):

The calculated present capacitance in μF (rounded-off to an integer number).

The 1st decimal point specifies the number of the phase (1, 2, 3) where the capacitance deviates from the specified value.

Remedy:

- check the parameterized value of the filter capacitance (p0221).
- check the correct wiring of the Voltage Sensing Module (VSM):
Differential voltages u_{12} and u_{23} must be present at the 100 V/690 V inputs of the VSM; the phase currents of the line filter must be connected to the 10 V inputs through a current - voltage converter.
- check the alarm limits for the permissible filter capacitance deviation (p3676).
- check the scaling of the line supply voltage measurement using the VSM (p3660).
- check the scaling of the filter current measurement using the VSM (p3670).
- check the line filter capacitors and if required, replace the line filter.

F06500 Infeed: Line synchronization not possible

Message value: -
Message class: Network fault (2)
Drive object: A_INF, R_INF, S_INF
Reaction: OFF2 (OFF1)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The line synchronization is not possible within the monitoring time.
The infeed was re-synchronized to the line supply because it was interrupted due to a line frequency that was determined to be either too low or too high.
After 20 attempts, synchronization - and therefore also the power-on operation - were interrupted.
Remedy: - check the parameterized line frequency and if required change (p0211).
- check the setting of the threshold values (p0284, p0285).
- check the line supply.
- check the connecting terminals
When using a voltage sensing module (VSM):
- check the line supply connection at the terminals (X521, X522).
- check VSM activation (p0145, p3400).
- check the line supply quality.
Note:
In the case of chassis power units, the availability of correct VSM voltage measured values is imperative for line synchronization.

Cause: Defective current measurement or a DC current is present during the offset measurement.
Alarm value (r2124, interpret decimal):
1: Excessively high phase current has occurred during the current offset calibration.
2: The measured current offset is greater than the 3% of the maximum permissible converter current (e.g. due to a ground fault in the DC link).
Remedy:
Re alarm value = 1:
- possible counter-measure if there is no line contactor: Power up an adequately long time before OFF1 = 1.
Re alarm value = 2:
- defective current measurement or a DC current is present during the offset measurement.

See also: p3491 (Infeed I-offset measurement monitoring time)

Remedy:

- check the DC link for a ground fault. A ground fault can destroy parts and components!
- Check the monitoring time setting and if required increase (p3491). At least 100 ms is required for a valid measurement (p3491 > 100 ms).

Cause: The DC link voltage setpoint has reached the maximum steady-state voltage parameterized in p0280. The DC link voltage is increased by the modulation depth reserve controller for the following reasons:

- modulation depth reserve is too low (p3480).
- line supply voltage is too high.
- supply voltage (p0210) parameterized to be too low.
- excessively high setpoint for the reactive line current.

Remedy:

- check the line supply voltage setting (p0210).
- check the line supply for an overvoltage condition.
- reduce the modulation depth reserve (p3480).
- reduce the reactive current setpoint.

A06860	Infeed: Function module activation not possible
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	A_INF, R_INF
Reaction:	NONE
Acknowledge:	NONE
Cause:	Function module activation is not possible. The power unit used does not have the "gating unit with current limitation control" feature (r0192.19 or r0192.30). The affected function module is identified in fault value r0949 (the value of r0949 corresponds to the bit of parameter p0108). r0949 = 7 "Dynamic grid support" function module r0949 = 12: "Line droop control" function module See also: r0192 (Power unit firmware properties 1), p5401 (Line droop control activation)
Remedy:	- check whether the power unit used has the "gating unit with current limitation control" feature (p0192.19 or r0192.30). - If required, replace the power unit being used by a power unit that has the "gating unit with current limitation control" feature.
A06900 (F)	Braking Module: Fault (1 -> 0)
Message value:	%1
Message class:	Braking Module faulted (14)
Drive object:	A_INF, B_INF, R_INF, S_INF
Reaction:	NONE
Acknowledge:	NONE
Cause:	The Braking Module signals a fault (1 -> 0) via X21.4 ("booksize" format) or X21.5 ("chassis" format). This signal is wired to a system digital input and correspondingly interconnected using binector input p3866[0...7]. Possible causes: - Wiring of the signal or BICO interconnection of the signal source incorrect. - Overtemperature - Electronics power supply missing. - Ground fault/short-circuit. - Internal component fault. See also: p3866 (Braking Module fault)

4 Faults and alarms

4.2 List of faults and alarms

Remedy:

- check binector input p3866[0...7] and the wiring from terminal X21.4 ("booksize" format) or X21.5 ("chassis" format).
- reduce the number of braking operations.
- Check the 24 V power supply of the component.
- Check for a ground fault or short circuit.
- Replace the component if necessary.

A06901 Braking Module: Pre-alarm I2t shutdown

Message value: %1

Message class: Braking Module faulted (14)

Drive object: A_INF, B_INF, R_INF, S_INF

Reaction: NONE

Acknowledge: NONE

Cause: The Braking Module "Booksize" format signals "Pre-alarm I2t shutdown" via terminal X21.3.
This signal is wired to a system digital input and correspondingly interconnected using binector input p3865[0...7].
Note:

This function is not supported for the "chassis" format.

Remedy:

- reduce the number of braking operations.
- check binector input p3865[0...7] and the wiring from terminal X21.3 of the particular Braking Module.

A06904 (N) Braking Module internal is inhibited

A06905 Braking Module internal I2t shutdown alarm

Message value: %1

Message class: Braking Module faulted (14)

Drive object: B_INF

Reaction: NONE

Acknowledge: NONE

Cause: The internal Braking Module outputs an alarm due to the high I2t value.
80% of the maximum switch-on duration of the braking resistor has been reached.
Note:

This message is also displayed via BO: p3685.

See also: r3685 (Digital Braking Module: Pre-alarm I2t shutdown)

Remedy: Reduce the number of braking operations.

F06906 (A)	Braking Module internal fault
Message value:	%1
Message class:	Braking Module faulted (14)
Drive object:	B_INF
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The internal Braking Module outputs a fault due to overcurrent or an excessively high I2t value and is therefore inhibited. Note: This message is also displayed via BO: p3686. Fault value (r0949, interpret bitwise binary): Bit 0 = 1: I2t exceeded Bit 1 = 1: overcurrent See also: r3686 (Digital Braking Module Fault)
Remedy:	Reduce the number of braking operations.

Message value:	-
Message class:	Braking Module faulted (14)
Drive object:	B_INF
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	The temperature sensor connected to the braking resistor signals an overtemperature. The Braking Module is still active. If the overtemperature persists for more than 60 s, fault F06908 is output, and the braking module is switched off. See also: r3687 (Digital Braking Module pre-alarm overtemperature)
Remedy:	- reduce the temperature at the sensor. - check the temperature sensor connection.

F06908	Braking Module internal overtemperature shutdown
Message value:	-
Message class:	Braking Module faulted (14)
Drive object:	B_INF
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	Braking module shut down due to overtemperature at the temperature sensor of the braking resistor. The overtemperature is detected by the sensor for longer than 60 s. See also: r3688 (Braking Module internal overtemperature shutdown)
Remedy:	- reduce the temperature at the sensor. - check the temperature sensor connection.

F06909	Braking Module internal Vce fault
Message value:	%1
Message class:	Braking Module faulted (14)
Drive object:	B_INF
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	In the power unit, the monitoring of the collector-emitter voltage (U _{ce}) of the power semiconductor to control the braking resistor has responded. Possible causes: - short circuit at the braking resistor terminals - defective power semiconductor in the braking resistor control.

4 Faults and alarms

4.2 List of faults and alarms

Note:

Under certain circumstances, this alarm is also output if a braking resistor has not been connected and power is fed back into the Braking Module.

See also: r3689 (Digital Braking Module Uce fault)

Remedy:

- connect a braking resistor.
- check the braking resistor connection.
- check the braking resistor.
- carry out a POWER ON (power off/on).
- replace the unit.

Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: Open-loop/closed-loop control parameters have had to be changed.
Possible causes:

1. As a result of other parameters, they have exceeded the dynamic limits.
2. They cannot be used due to the fact that the hardware detected not having certain features.
3. The value is estimated as the thermal time constant is missing.
4. Motor temperature model 1 is activated as thermal motor protection is missing.

Fault value (r0949, interpret decimal):

Acknowledge:	IMMEDIATELY
Cause:	A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation. The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting. Possible causes: - the steady-state minimum limit/maximum limit or that defined in the application was violated. Fault value (r0949, parameter): Diagnostics parameter to display the parameters that were not able to be re-calculated. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
Remedy:	Check the adapted parameter value and if required correct. See also: r9450 (Reference value change parameter with unsuccessful calculation)
F07087	Drive: Encoderless operation not possible for the selected pulse frequency
Message value:	Parameter: %1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	Encoderless operation is not possible for the selected pulse frequency (p1800). Encoderless operation is activated under the following conditions: - the changeover speed for encoderless operation (p1404) is less than the maximum speed (p0322). - a control type with encoderless operation has been selected (p1300). - encoder faults of the motor encoder result in a fault response with encoderless operation (p0491). See also: p0491, p1300, p1404, p1800
Remedy:	Increase the pulse frequency (p1800). Note: In encoderless operation, the pulse frequency must be at least as high as half the current controller clock cycle (1/p0115[0]).
F07088	Units changeover: Parameter limit violation due to units changeover

Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A changeover of units was initiated. This resulted in a violation of a parameter limit Possible causes for the violation of a parameter limit: - When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated. - inaccuracies for the data type "FloatingPoint". In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down. Fault value (r0949, interpret decimal): Diagnostics parameter r9451 to display all parameters whose value had to be adapted. See also: p0100 (IEC/NEMA mot stds), p0349 (System of units motor equivalent circuit diagram data), p0505 (Selecting the system of units), p0595 (Technological unit selection)
Remedy:	Check the adapted parameter values and if required correct. See also: r9451 (Units changeover adapted parameters)

Message class: Application / technological function faulted (17)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause:

- The specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt.
- there is no active ON command.
- the monitoring time for the power unit has expired (p0857).
- when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically powered up again.

Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.

Remedy:

- increase the number of restart attempts (p1211). The actual number of starting attempts is displayed in r1214.
- increase the delay time in p1212 and/or the monitoring time in p1213.
- issue an ON command (p0840).
- either increase or disable the monitoring time of the power unit (p0857).

Cause: The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate.

Remedy:

- the automatic restart (AR) should, if required, be inhibited (p1210 = 0).
- an automatic restart can be directly interrupted by withdrawing the power-on command (BI: p0840).

A07329 (N)	Drive: kT estimator, kT(iq) characteristic or voltage compensation does not function
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	A function of the function module "extended torque control" (r0108.1) was activated - however the (complete) function is not available. Fault value (r0949, interpret decimal): 1 ... 3: The kT estimator is active (p1780.3 = 1) without a functioning compensation of the voltage emulation error in the drive converter. This means that the accuracy is severely restricted. 1: The drive converter voltage emulation error "final value" is 0 (p1952). 2: The drive converter voltage emulation error "current offset" is 0 (p1953). 3: The compensation of the voltage emulation error is disabled (p1780.8 = 0). 4: The kT estimator (p1780.3 = 1), the kT(iq) characteristic (p1780.9 = 1) or the compensation of the voltage emulation error (p1780.8 = 1) was activated without activating the function module "extended torque control" (when the function module is activated, the following must apply: r0108.1 = 1).
Remedy:	Re fault value = 1, 2: - carry out an identification of the voltage emulation error in the drive converter (p1909.14 = 1, p1910 = 1). - set the parameter to compensate the voltage emulation error in the drive converter (p1952, p1953). For fault value = 3: - enable the compensation of the voltage emulation error in the drive converter (p1780.8 = 1). For fault value = 4: - activate the function module "extended torque control" (r0108.1 = 1) or de-activate the corresponding functions (p1780.3 = 0, p1780.8 = 0, p1780.9 = 0).

In the following cases, the "flying restart" function is not supported: Permanent-magnet and separately-excited synchronous motors (PEM, FEM): Operation with U/f characteristic. Permanent-magnet synchronous motor (PEM): Encoderless operation without a Voltage Sensing Module (VSM) being connected.
Remedy:	- de-activate the "flying restart" function (p1200 = 0). - change the open-loop/closed-loop control mode (p1300). - connect a Voltage Sensing Module (VSM) (voltage measurement).

Message value: Fault cause: %1, drive data set: %2

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: Cogging torque compensation is selected and is not (completely) supported.
Fault value (r0949, interpret hexadecimal):
yyyyxxxx hex: yyyy = fault cause, xxxx = drive data set
yyyy = 1: The encoder evaluation does not support this function.
yyyy = 2: The encoder has no absolute information.
yyyy = 3: The motor has no encoder (p0187 = 99).

Remedy: If required, deselect the cogging torque compensation (p5250 = 0).
 Re fault cause = 1:
 Use an absolute encoder or an encoder evaluation that supports the function (r0459.13 = 1). If required, upgrade the firmware to a newer version (version 04.50.30.01 or higher is required).
 Re fault cause = 2:
 Use an encoder with absolute information (absolute track, unique zero mark, resolver with one pole pair). The function cannot be tested as long as the encoder is not reset after learning (encoder fault, parking, POWER ON). Continuous use is not recommended.
 Re fault cause = 3:
 Only select cogging torque compensation for operation with motor encoder.

A07400 (N) Drive: DC link voltage maximum controller active
Message value: -
Message class: Application / technological function faulted (17)
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The DC link voltage controller has been activated because of the upper switch-in threshold (p1244). A system deviation can occur between the setpoint and actual speed.
 See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration)
Remedy: Not necessary.
 This alarm automatically disappears after the upper threshold has been distinctly undershot.
 Otherwise, apply the following measures:
 - use a Braking Module or regenerative feedback unit.
 - increase the ramp-down times (p1121, p1135).
 - shut down the Vdc_max controller (p1240 = 0).

A07400 (N) Drive: DC link voltage maximum controller active
Message value: -
Message class: Application / technological function faulted (17)
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282).
 The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.
 When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.
 See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (U/f))
Remedy: If the controller is not to intervene:
 - increase the ramp-down times.
 - switch-off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).
 If the ramp-down times are not to be changed:
 - use a chopper or regenerative feedback unit.

Cause: The specified flux setpoint cannot be reached, although the set maximum field current is specified (p1603).
- incorrect motor data.
- motor data and motor configuration (star-delta) do not match.
- the current limit has been set too low for the motor (p0640, p0323, p1603).
- induction motor (encoderless, open-loop controlled) in I2t limiting.
- the Motor Module is too small.

Remedy:
- correct the motor data.
- check the motor configuration.
- correct the current limits (p0640, p0323, p1603).
- reduce the induction motor load.
- if required, use a larger Motor Module.

Cause:	<p>An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.</p> <p>Possible causes:</p> <ul style="list-style-type: none">- The phase sequence of the output phases for the motor is incorrect (e.g. the phases are interchanged).- the motor encoder is incorrectly adjusted with respect to the magnet position.- the motor encoder is damaged.- the angular commutation offset is incorrectly set (p0431).- data to calculate the motor model has been incorrectly set (p0356 (motor-stator leakage inductance) and/or p0350 (motor-stator resistance) and/or p0352 (cable resistance)).- the changeover speed for the motor model is too low (p1752). The monitoring function only becomes effective above the changeover speed.- pole position identification might have calculated an incorrect value when activated (p1982 = 1).- the motor encoder speed signal is faulted.- the control loop is instable due to incorrect parameterization. <p>Fault value (r0949, interpret decimal):</p> <p>SERVO:</p> <p>0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 80 ° electrical).</p> <p>1: -</p> <p>VECTOR:</p> <p>0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 45 ° electrical).</p> <p>1: The change in the speed signal from the motor encoder has changed by > p0492 within a current controller clock cycle.</p>

F07413	Drive: Commutation angle incorrect (pole position identification)
Message value:	-
Message class:	Position/speed actual value incorrect or not available (11)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	ENCODER (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	An incorrect commutation angle was detected that can result in a positive coupling in the speed controller. Within the pole position identification routine (p1982 = 2): - a difference of > 45 ° electrical to the encoder angle was determined. For VECTOR, within the encoder adjustment (p1990 = 2): - a difference of > 6 ° electrical to the encoder angle was determined.
Remedy:	- correctly set the angular commutation offset (p0431). - re-adjust the motor encoder after the encoder has been replaced. - replace the defective motor encoder. - check the pole position identification routine. If the pole position identification routine is not suitable for this motor type, then disable the plausibility check (p1982 = 0).

F07414 (N, A)	Drive: Encoder serial number changed
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	ENCODER (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2). Cause 1: - The encoder was replaced. Cause 2: - A third-party, built-in or linear motor was re-commissioned. Cause 3: - The motor with integrated and adjusted encoder was replaced. Cause 4: - The firmware was updated to a version that checks the encoder serial number. Note: With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2). When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1). Proceed as follows to hide serial number monitoring: - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0. - parameterize F07414 as message type N (p2118, p2119).
Remedy:	Re causes 1, 2: Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed. SERVO: If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated. or Set the adjustment via p0431. In this case, the new serial number is automatically accepted. or Mechanically adjust the encoder. Accept the new serial number with p0440 = 1. Re causes 3, 4: Accept the new serial number with p0440 = 1.

F07417	Drive: Pulse technique not plausible (motor model)
Message value:	%1
Message class:	Application / technological function faulted (17)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY
Cause:	The evaluation of the test pulse response indicated incorrect values. Fault value (r0949, interpret decimal): 0: An impermissible pulse technique configuration was detected during ramp-up. Possible causes: - The pulse technique was initially selected when the system powered up (p1750.5 = 1) but the power unit component does not support the current oversampling required (see r0192.23). As a consequence, p1750.0 was de-selected automatically. 10: The pulse response is repeatedly implausible. Possible causes: - Incorrect configuration of the power unit component - The power unit component is faulty. 20: For the specified pulse amplitude, the measured pulse response is much higher than the expected value. Possible causes: - Strong oscillations have occurred. - The motor is short-circuited for high frequencies (output filter). - The motor is damaged.
Remedy:	For fault value = 0: Once the pulse technique has been de-selected automatically (p1750.5 = 0), there are two possible options: - acknowledge the fault and save parameter p1750.5 = 0 -> field-oriented control mode to standstill is not used and replaced by transition to open-loop control at low speeds. - upgrade the power unit firmware (at least V4.3) -> field-oriented control mode to standstill is available. For fault value = 10: With active selection of the pulse technique (p1750.5 = 1): - POWER ON (switch-off/switch-on) the Control Unit and the power unit together again. or - carry out a manual warm restart (p0009 = 30, p0976 = 2, 3). If this does not solve the problem: Replace the power unit component. For fault value = 20: - control parameters might have been adjusted (factory setting, commissioning). - filters must not be connected between motor and converter/inverter. - check the motor.

4.2 List of faults and alarms

Bit 16 ... 31: number of the drive data set with fault.

See also: p5280 (Current setpoint filter adaptation configuration), p5281 (Current setpoint filter adaptation assignment)

Remedy:

The message can always be removed by deactivating adaptation (p5280 = 0, -1).

If adaptation is to remain active, then the countermeasure should be applied depending on the particular fault value.

Re bit 0:

assign the filter (p5281).

Re bit 1:

activate the "Extended current setpoint filter" function module (r0108.21).

Re bit 2:

Set the filter type "General filter 2nd order" and set the characteristic of a bandstop filter.

Re bit 3:

Activate filter (p1656 or p5200).

Re bits 4 ... 15:

- carry out a POWER ON (power off/on) for all components.

- upgrade firmware to later version.

F07432	Drive: Motor without overvoltage protection
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system. Fault value (r0949, interpret hexadecimal): Associated Drive Data Set (DDS).
Remedy:	Overvoltage protection can be implemented in the following ways: 1. Limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: Rotary synchronous motors: $p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}$ Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * r0297/p0316 \text{ [N/A]}$ Rotary synchronous motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq 4.33165E9 * (-p0316 + \sqrt{p0316^2 + 4.86E-9 * (r0297 * r0313)^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}}) / (r0297 * r0313^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Linear motor connected to the high-frequency converter: $p1082 \text{ [m/min]} \leq 689.403 * p0315 * (\sqrt{p0316^2 * p0315^2 + 0.191865 * r0297^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}}) / (r0297 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Rotary induction motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq \text{maximum} (2.11383E5 / (r0313 * \sqrt{(r0377 \text{ [mH]} + r0382 \text{ [mH]} * p0234 \text{ [\mu F]})}); 0.6364 * r0297 * p0311 \text{ [rpm]} / p0304)$ 2. Use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801 – only for synchronous motors). When using a synchronous motor with VPM at the high-frequency converter, the following must apply: $p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233$ When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM. When using a VPM, p0643 must be set to 1. 3. Activate the internal voltage protection (p1231 = 3, only for synchronous motors). In so doing, the following hardware preconditions must be fulfilled: - The infeed of the group must be capable of energy recovery (Active Line Module, Smart Line Module), and the energy recovery power of the infeed must not be less than the maximum utilized S1 power of the synchronous motor. - For Control Unit and infeed, a 24 V power supply other than that for the Motor Module must be used with the voltage protection activated. The 24 V power supply of this Motor Module must be DC link buffered (e.g. CSM). - A Braking Module with a correspondingly configured braking resistor must be available at the DC link. - The synchronous motor must be short-circuit proof. See also: p0643 (Overvoltage protection for synchronous motors), p1231 (Armature short-circuit / DC braking configuration)

F07433	Drive: Closed-loop control with encoder is not possible as the encoder has not been unparked
Message value:	%1
Message class:	Position/speed actual value incorrect or not available (11)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The changeover to closed-loop control with encoder is not possible as the encoder has not been unparked.
Remedy:	- check whether the encoder firmware supports the "parking" function (r0481.6 = 1). - upgrade the firmware. Note: For long-stator motors (p3870.0 = 1), the following applies: The encoder must have completed the unparking procedure (r3875.0 = 1) before a changeover can be made to closed-loop control with encoder. The encoder is unparked using binector input p3876 = 0/1 signal and remains until a 0 signal in this state.

F07434	Drive: It is not possible to change the direction of rotation with the pulses enabled
Message value:	-
Message class:	Application / technological function faulted (17)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A drive data set was selected - with the pulses enabled - which has a different parameterized direction of rotation (p1821). It is only possible to change the motor direction of rotation using p1821 when the pulses are inhibited.
Remedy:	- change over the drive data set with the pulses inhibited. - ensure that the changeover to a drive data set does not result in the motor direction of rotation being changed (i.e. for these drive data sets, the same value must be in p1821). See also: p1821

F07435 (N)	Drive: Setting the ramp-function generator for sensorless vector control
Message value:	Parameter: %1
Message class:	Application / technological function faulted (17)
Drive object:	HLA, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Vector: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3) Hla: OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized. The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).
Remedy:	- de-activate the holding command for the ramp-function generator (p1141). - do not bypass the ramp-function generator (p1122). - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6). Note: For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

4 Faults and alarms

4.2 List of faults and alarms

Remedy:

For fault value = 1:

- If necessary, upgrade the firmware of the booksize power unit to a later version (version \geq 4.4).

Note:

If the firmware has already been automatically upgraded, then only a POWER ON (switch-off/switch-on) is required.

- Use a booksize power unit (version \geq 4.4).

For fault value = 2:

- If an encoder with Safety position actual values sensing is available ($r0458[0...2].19 = 1$), reparameterize the encoderless safety technology ($p9506 = 1, 3$) to safety technology with encoder ($p9506 = 0$).

Re fault value = 1, 2:

- Deselect the function "Current controller dynamics higher" ($p1810.11 = 0$) and if required, set the current, speed and position controller again or calculate ($p0340 = 4$).

For fault value = 3:

- If necessary, upgrade the firmware of the blocksize power unit to a later version (version \geq 4.6).

A07440 **EPOS: Jerk time is limited**

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC

Reaction: NONE

Acknowledge: NONE

Cause: The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms.

Note:

The alarm is also output if jerk limiting is not active.

Remedy:

- increase the jerk limiting (p2574).
- reduce maximum acceleration or maximum deceleration (p2572, p2573).

See also: p2572 (EPOS maximum acceleration), p2573 (EPOS maximum deceleration), p2574 (EPOS jerk limiting)

A07441 **LR: Save the position offset of the absolute encoder adjustment**

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC

Reaction: NONE

Acknowledge: NONE

Cause: The status of the absolute encoder adjustment has changed.

In order to permanently save the determined position offset (p2525) and the determined number of the drive data set (p2733), they must be saved in a non-volatile fashion (p0971, p0977).

Remedy: Not necessary.

This alarm automatically disappears after the offset has been saved.

F07442 (A) **LR: Multiturn does not match the modulo range**

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC

Reaction: OFF1 (OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.

This results in the adjustment being set back, as the position actual value cannot be reproduced after power-off/power-on.

Remedy: Make the ratio between the multiturn resolution and the modulo range an integer number.

The ratio v is calculated as follows:

1. Motor encoder without position tracking

$$v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$$

2. Motor encoder with position tracking for the measuring gear

$$v = (p0412 * p2506 * p2505) / (p2504 * p2576)$$

3. Motor encoder with position tracking for the load gear

$$v = (p2721 * p2506 * p0433) / (p0432 * p2576)$$

4. Motor encoder with position tracking for the load and measuring gear

$$v = (p2721 * p2506) / p2576$$

5. Direct encoder without position tracking

$$v = (p0421 * p2506 * p0433) / (p0432 * p2576)$$

6. Direct encoder with position tracking for the measuring gear

$$v = (p0412 * p2506) / p2576$$

Note:

With position tracking, it is recommended that $p0412$ and $p2721$ are changed

Cause: During the search for reference, when the axis reached the zero mark it also reached the end of the traversing range without detecting an edge at the binector input "reference cam" (BI: p2612).

Maximum traversing range: -2147483648 [LU] ... -2147483647 [LU]

Remedy:

- check the "reference cam" binector input (BI: p2612).
- repeat the search for reference.

F07493	LR: Overflow of the value range for position actual value
Message value:	%1
Message class:	Application / technological function faulted (17)
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	OFF1 (OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$
Remedy:	If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419). Note for fault value = 3: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow. For rotary encoders, the maximum possible absolute position (LU) is calculated as follows: 1. Motor encoder without position tracking $p2506 * p0433 * p2505 / (p0432 * p2504)$ $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders 2. Motor encoder with position tracking for measuring gear: $p2506 * p0412 * p2505 / p2504$ 3. Motor encoder with position tracking for load gear $p2506 * p2721 * p0433 / p0432$ 4. Motor encoder with position tracking for load and measuring gear $p2506 * p2721$ 5. Direct encoder without position tracking $p2506 * p0433 / p0432$ $p2506 * p0433 * p0421 / p0432$ for multiturn encoders 6. Direct encoder with position tracking for measuring gear $p2506 * p0412$

Fault value (r0949, interpret decimal): The fault value includes the drive data set number of p0187, p0188 and p0189. The fault value is increased by 100 * encoder number (e.g. for p0189: Fault value 3xx with xx = data set number).
Remedy:	The index of the encoder data set associated with the drive data set should be entered into p0187 (1st encoder), p0188 (2nd encoder) and p0189 (3rd encoder).

Cause:	A motor data set is not assigned to a drive object. All of the existing motor data sets in the drive data sets must be assigned using the MDS number (p0186[0...n]). There must be at least as many drive data sets as motor data sets. Alarm value (r2124, interpret decimal): Number of the motor data set that has not been assigned.
Remedy:	In the drive data sets, assign the non-assigned motor data set using the MDS number (p0186[0...n]). - check whether all of the motor data sets are assigned to drive data sets. - if required, delete superfluous motor data sets. - if required, set up new drive data sets and assign to the corresponding motor data sets. Example: Fault value = 1203 means: In drive data set 3, the first (p0187[3]) and second encoder (p0188[3]) are identical.
Remedy:	Assign the drive data set to different encoders. See also: p0141, p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number)

Cause: The assignment between the drive data set and motor data set (p0186) or between the drive data set and the encoder data set was modified (p0187). This is the reason that the drive data set must re-commissioned.

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: An MDS cannot have different motor encoders in two different DDS.
The following parameterization therefore results results in an error:
p0186[0] = 0, p0187[0] = 0
p0186[0] = 0, p0187[0] = 1
Alarm value (r2124, interpret decimal):
The lower 16 bits indicate the first DDS and the upper 16 bits indicate the second DDS.

Remedy: If you wish to operate a motor once with one motor encoder and then another time with the other motor encoder, then you must set up two different MDSs, in which the motor data are the same.
Example:
p0186[0] = 0, p0187[0] = 0
p0186[0] = 1, p0187[0] = 1

Cause: The system has identified that two motor data sets were incorrectly parameterized.
Parameter r0313 (calculated from p0314, p0310, p0311), r0315 and p1982 may only have different values if the motor data sets are assigned different motors. p0827 is used to assign the motors and/contactors.
It is not possible to toggle between motor data sets.
Alarm value (r2124, interpret hexadecimal):

Cause:	The motor cannot be changed over. Alarm value (r2124, interpret decimal): 1: The contactor for the motor that is presently active cannot be opened, because for a synchronous motor, the speed (r0063) is greater than the speed at the start of field weakening (p0348). As long as r0063 > p0348, the current in the motor does not decay in spite of the pulses being suppressed. 2: The "contactor opened" feedback signal was not detected within 1 s. 3: The "contactor closed" feedback signal was not detected within 1 s.
Remedy:	Re alarm value = 1: Set the speed lower than the speed at the start of field weakening (r0063 < p0348). Re alarm value = 2, 3: Check the feedback signals of the contactor involved.

F07555 (A) Drive encoder: Configuration position tracking

Message value: Component number: %1, encoder data set: %2, drive data set: %3, fault cause: %4

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, ENC, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

Infeed: OFF2 (NONE, OFF1)
Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Vector: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: For position tracking, the configuration is not supported.

Position tracking can only be activated for absolute encoders.

For linear axes, it is not possible to simultaneously activate the position tracking for load and measuring gears.

Fault value (r0949, interpret hexadecimal):

ddccbbaa hex

aa = encoder data set

bb = component number

cc = drive data set

dd = fault cause

dd = 00 hex = 0 dec

An absolute encoder is not being used.

dd = 01 hex = 1 dec

Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.

dd = 02 hex = 2 dec

For a linear axis, the position tracking was activated for the load and measuring gear.

dd = 03 hex = 3 dec

Position tracking cannot be activated because position tracking with another gear ratio, axis type or tolerance window has already been detected for this encoder data set.

dd = 04 hex = 4 dec

A linear encoder is being used.

See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration)

Remedy: For fault value 0:

- use an absolute encoder.

For fault value 1:

- use a Control Unit with sufficient NVRAM.

Re fault value = 2, 4:

- if necessary, de-select the position tracking (p0411 for the measuring gear, p2720 for the load gear).

For fault value 3:

- Only activate position tracking of the load gear in the same encoder data set if the gear ratio (p2504, p2505), axis type (p2720.1) and tolerance window (p2722) are also the same. These parameters must be the same in all drive data sets, which use the same motor encoder (p187).

Remedy: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow.

For rotary encoders, the maximum possible absolute position (LU) is calculated as follows:

Fault value (r0949, interpret hexadecimal):

cc = 0: parameter has the value zero that is not permitted.

cc = 1: piston rod greater than piston diameter.

cc = 2: cylinder without piston rod (p0311 = 0 and p0312 = 0).

cc = 3: position overflow possible in the traversing range (check p0407 and p0313 and if required, reduce p0418).

Reaction: OFF2 (NONE, OFF1, OFF3)

Cause: A valve with a valve feedback signal was parameterized (p0218.2 = 1), however the valve does not follow the setpoint.
Remedy:
- correct the configuration for the valve without valve feedback signal (p0218.2 = 0).
- check the valve natural frequency (p0216).
- for the incorrect sign, invert the valve actual value (p0218.3).
- check the valve and valve connection.

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA
Reaction: OFF1 (NONE, OFF2, OFF3)

Cause: The piston was calibrated (p0476 not equal to 0) and the absolute position is available (p1407.7 = 1). However, the piston position (r0094) is not plausible (negative or higher than the stroke in p0313).
Remedy:
- check position inversion (p0410.1).
- check direction convention: piston position (r0094) must be zero, if the piston is located at the A side. When moving from the A to the B side, velocity and position increase must be positive.
- check the piston calibration, and if required, recalibrate the piston with the piston at the A side (p1909.1 = 1).
- when replacing the encoder, recalibrate the piston.
- when shifting the machine zero point, recalibrate the piston.
Note:
Before acknowledging the fault, set p0476 = 0. Then calibrate the piston again (p1909.1 = 1 with the piston completely retracted or p1959.2 = 1 and p1960 = 1).

F07810 **Drive: Power unit EEPROM without rated data**

Message value: -

Message class: Hardware / software error (1)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: No rated data are stored in the power unit EEPROM.
See also: p0205, r0206, p0206, r0207, p0207, r0208, p0208, r0209, p0209

Remedy: Replace the power unit or inform Siemens Customer Service.

F07815 **Drive: Power unit has been changed**

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum).
Fault value (r0949, interpret decimal):
Number of the incorrect parameter.
See also: r0200 (Power unit code number actual), p0201 (Power unit code number)

Remedy: Connect the original power unit and power up the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0.
For infeeds, the following applies:
Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.
For inverters, the following applies:
If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).
If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.

A07820	Drive: Temperature sensor not connected
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The temperature sensor for monitoring the motor temperature, specified in p0600, is not available. Alarm value (r2124, interpret decimal): 1: p0601 = 10 (SME), but in p0600 - not evaluated via encoder is selected. 2: p0600 = 10 (BICO), but the signal source (p0603) is not interconnected. 3: p0601 = 11 (BICO), but in p0600 - not evaluated via BICO interconnection is selected (20 or 21). 4: p0601 = 11 (BICO) and p4610-p4613 > 0, but the associated signal source (p0608, p0609) is not interconnected. 5: Component with sensor evaluation not present or has been removed in the meantime. 6: Evaluation via Motor Module not possible (r0192.21).
Remedy:	Re alarm value = 1: - In p0600 set an encoder with temperature sensor. Re alarm value = 2: - interconnect p0603 with the temperature signal. Re alarm value = 3, 4: - set the available temperature sensor (p0600, p0601). - set p4610 ... p4613 = 0 (no sensor), or interconnect p0608 or p0609 with an external temperature signal.

Message value: -

Message class: Application / technological function faulted (17)

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The simulation mode is activated and the DC link voltage is greater than the permissible value of 40 V.

Remedy: - switch out (disable) simulation mode (p1272 = 0) and acknowledge the fault.

- reduce the input voltage in order to reach a DC link voltage below 40 V.

F07840 Drive: Infeed operation missing

Message value: -

Message class: Infeed faulted (13)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause: The signal "infeed operation" is not present although the enable signals for the drive have been present for longer than the parameterized monitoring time (p0857).

- infeed not operational.

- interconnection of the binector input for the ready signal is either incorrect or missing (p0864).

- infeed is presently carrying out a line supply identification routine.

Remedy: - bring the infeed into an operational state.

- check the interconnection of the binector input for the signal "infeed operation" (p0864).

- increase the monitoring time (p0857).

- wait until the infeed has completed the line supply identification routine.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: The signal "infeed operation" was withdrawn in operation.

- interconnection of the binector input for the signal "infeed operation" is either incorrect or missing (p0864).

- the enable signals of the infeed were disabled.

- due to a fault, the infeed withdraws the signal "infeed operation".

Remedy:

- check the interconnection of the binector input for the "infeed operation" signal (p0864).
- check the enable signals of the infeed and if required, enable.
- remove and acknowledge an infeed fault.

Note:
If this drive is intended to back up the DC link regeneratively, then the fault response must be parameterized for NONE, OFF1 or OFF3. so that the drive can continue to operate even after the infeed fails.

Message value:	Parameter: %1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE

Cause:	Stall monitoring is not possible, because a change was made into the open-loop speed controlled mode before the wait time p2177 had expired. This situation can only occur, if the following conditions apply: p1300 = 20 p2177 > p1758 p1750.2 = 0 p1750.6 = 0
Remedy:	- Deactivate the changeover into open-loop speed controlled operation when operating at the torque limit (p1750.6 = 0). Condition: No slow reversing through the open-loop speed controlled operating range p1755 within the time p1758 when operating at the torque limit. - shorten the stall detection wait time (p2177 < p1758). - Activate closed-loop controlled operation from standstill and higher (p1750.2 = 1). F07902 (N, A)**Drive: Motor stalled**

Message value: %1

Message class: Application / technological function faulted (17)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.

Fault value (r0949, interpret decimal):

1: Stall detection using r1408.11 (p1744, p0492).

2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084).

3: Stall detection using r0056.11 (only for separately excited synchronous motors).

See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)

Remedy:

For closed-loop speed and torque control with speed encoder, the following applies:

- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).

- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1744 and p0492) can be increased.

For closed-loop speed and torque control without speed encoder, the following applies:

- check whether the drive in the open-loop controlled mode (r1750.0) stalls under load. If yes, then increase the current setpoint using p1610.

- check whether the drive stalls due to the load if the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.

- if the motor excitation (magnetizing) time (r0346) was significantly reduced, then it should be increased again.

- check the current limits (p0640, r0067). If the current limits are too low, then the drive cannot be magnetized.

- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.

- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

For separately-excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).

- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).

- check the excitation equipment and the interface to the closed-loop control.

- encoder the highest possible dynamic response of the closed-loop excitation current control.

- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.

- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

F07902 (N, A)	Drive: Motor stalled
Message value:	%1
Message class:	Application / technological function faulted (17)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The system has identified that the motor has stalled for a time longer than is set in p2178. Fault value (r0949, interpret decimal): 1: Stall detection using r1408.11 (p1744, p0492). 2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084). 3: Stall detection using r0056.11 (only for separately excited synchronous motors). See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)
Remedy:	It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990). For closed-loop speed and torque control with speed encoder, the following applies: - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover. If there is no fault, then the fault tolerance (p1744 or p0492) can be increased. For resolvers with a high signal ripple, for example p0492 should be increased and the speed signal smoothed (p1441, p1442). If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 x p0311; p1753 = 5 %). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover. For closed-loop speed and torque control without speed encoder, the following applies: - Check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750.2 = 1 (sensorless vector control to standstill for passive loads). - If the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401). - check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again. - If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased. The following generally apply for closed-loop and torque control: - Check whether the motor cables are disconnected. - check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized. - If the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553. For separately-excited synchronous motors (closed-loop control with speed encoder), the following applies: - check the speed signal (interrupted cable, polarity, pulse number). - ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters). - check the excitation equipment and the interface to the closed-loop control. - encoder the highest possible dynamic response of the closed-loop excitation current control. - check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter. - do not exceed the maximum speed (p2162). If there is no fault, then the delay time can be increased (p2178).

Cause:	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	Not necessary. The alarm automatically disappears once DC braking has been executed.

Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
Remedy:	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

Cause: A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly).
Fault value (r0949, interpret decimal):
0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives).

3: An attempt was made to enable the function "Safe brake control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.

Remedy: Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2).
The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.

Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	An incorrect motor holding brake configuration was detected. Fault value (r0949, interpret decimal): 0: A motor holding brake was detected where the brake control has not been configured (p1215 = 0). The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time). For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time). For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time). 1: A motor holding brake was detected where the brake control has not been configured (p1215 = 0). The brake control configuration was left at "No motor holding brake available" (p1215 = 0). 11: The identification had detected more than one motor holding brake for a parallel connection. 12: For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015. 13: With the "Safe brake control" (SBC) function activated, an attempt was made to change the value in p7015. 14: For a parallel connection, the power units set in p7015 cannot be addressed.
Remedy:	For fault value = 0: - No remedy required. For fault value = 1: - If required change the motor holding brake configuration (p1215 = 1, 2). - If this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged. For fault value = 11: For a parallel connection, only connect one motor holding brake. For fault value = 12: Check the setting of the power unit data set for a parallel connection (p7015). For fault value = 13: Before changing p7015, deactivate the "Safe brake control" function (SBC) (p9602). For fault value = 14: Check whether the power unit supports the brake control for a parallel connection (r9771.14). Check whether there is a DRIVE-CLiQ communication error between the Control Unit and the power unit involved and, if required, carry out a diagnostics routine for the faults identified. Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The friction characteristic is incorrect.
Alarm value (r2124, interpret decimal):
1538:
The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.
1539:
The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.
3820 ... 3829:
Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition:
 $0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$ or $p1082$, if $p0322 = 0$
Therefore the output of the friction characteristic (r3841) is set to zero.
3830 ... 3839:
Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition:
 $0 \leq p3830, p3831 \dots p3839 \leq p0333$
Therefore the output of the friction characteristic (r3841) is set to zero.
See also: r3840 (Friction characteristic status word)
Remedy: Fulfill the conditions for the friction characteristic.
Re alarm value = 1538:
Check the upper effective torque limit (e.g. in the field weakening range).
Re alarm value = 1539:
Check the lower effective torque limit (e.g. in the field weakening range).
Re alarm value = 3820 ... 3839:

If the motor data (e.g. the maximum speed p0322) are changed during commissioning (p0010 = 1, 3), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting p0340= 5).

Cause: The alarm indicates the phases of the fine encoder calibration using the alarm value.
Alarm value (interpret decimal):
1: Fine encoder calibration active.
2: Rotating measurement started (set the setpoint speed > 40 % rated motor speed).
3: Rotating measurement lies within the speed and torque range.
4: Rotating measurement successful: pulse inhibit can be initiated to accept the values.
5: Fine encoder calibration is calculated.
10: Speed too low, rotating measurement interrupted.
12: Torque too high, rotating measurement interrupted.

Remedy: Re alarm value = 10:
Increase the speed.
Re alarm value = 12:
Bring the drive into a no-load condition.

Cause:	<p>The rotating measurement is activated. For the rotating measurement, the motor can accelerate up to the maximum speed and with maximum torque. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).</p> <p>The rotating measurement is carried out at the next power-on command.</p> <p>See also: p1960</p>
Remedy:	<p>Not necessary.</p> <p>The alarm automatically disappears after the rotating measurement has been successfully completed or for the setting p1960 = 0.</p> <p>Note:</p> <p>If a POWER ON or a warm restart is performed with motor data identification selected, the motor data identification request will be lost. Reaction:	OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	A fault has occurred during the encoder test. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: The encoder does not supply a signal. 6: Incorrect polarity. 7: Incorrect pulse number. 8: Noise in the encoder signal or speed controller unstable. 9: Voltage Sensing Module (VSM) incorrectly connected.
Remedy:	For fault value = 1: - check the motor parameters. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). For fault value = 3: - adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101). Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	A fault has occurred while determining the saturation characteristic. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The rotor flux did not reach a steady-state condition. 3: The adaptation circuit did not reach a steady-state condition. 4: The adaptation circuit was not enabled.

- 5: Field weakening active.
- 6: The speed setpoint was not able to be approached as the minimum limiting is active.
- 7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
- 8: The speed setpoint was not able to be approached as the maximum limiting is active.
- 9: Several values of the determined saturation characteristic are not plausible.
- 10: Saturation characteristic could not be sensibly determined because load torque too high.

Remedy:

For fault value = 1:

- the total drive moment of inertia is far higher than that of the motor (p0341, p0342).

De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

Re fault value = 1 ... 2:

- increase the measuring speed (p1961) and repeat the measurement.

Re fault value = 1 ... 4:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 5:

- the speed setpoint (p1961) is too high. Reduce the speed.

For fault value = 6:

- adapt the speed setpoint (p1961) or minimum limiting (p1080).

For fault value = 7:

- adapt the speed setpoint (p1961) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 8:

- adapt the speed setpoint (p1961) or maximum limit (p1082, p1083 and p1086).

Re fault value = 9, 10:

- the measurement was carried out at an operating point where the load torque is too high. Select a more suitable operating point, either by changing the speed setpoint (p1961) or by reducing the load torque. The load torque may not be varied while making measurements.

Note:

The saturation characteristic identification routine can be disabled using p1959.1.

193: Inadmissible motion of the motor when identifying the voltage emulation error.

194: Supplementary torque (r1515) not equal to zero.

195: Closed-loop torque control active.

200, 201: Not possible to identify the voltage emulation error characteristic of the drive converter (p1952, p1953).

Remedy:

For fault value = 10:

- do not initiate a data set changeover during the motor data identification.

For fault value = 101:

- increase current limit (p0640) or torque limit (p1520, p1521).
- check current controller gain (p1715).
- reduce current controller sampling time (p0115).

It may be impossible to completely identify the L characteristic, as required current amplitude is too high.

- suppress meas. (p1909, p1959).

Re fault value = 102, 104:

- check current controller P gain.
- suppress meas. (p1909, p1959).

For fault value = 103:

- increase external moment of inertia (if possible).
- reduce current controller sampling time (p0115).
- suppress meas. (p1909, p1959).

For fault value = 110:

- before rotating measurement, traverse motor over zero mark.

For fault value = 111:

- it is possible that encoder does not have zero mark. Correct setting in p0404.15.
- encoder pulse number was incorrectly entered. Correct setting in p0408.
- if zero mark signal is defective, replace encoder.

For fault value = 112:

- upgrade encoder software.

For fault value = 113:

- check the limits (p0640, p1520, p1521, p1530, p1531), correct the zero values.

For fault value = 115:

- de-select U/f control (p1317 = 0).

For fault value = 120:

- suppress meas. (p1909, p1959).

For fault value = 190:

- set speed setpoint to zero.

For fault value = 191:

- do not start motor data identification routine while motor is still rotating.

For fault value = 192:

- check closed-loop speed control (motor rotor may be locked or closed-loop speed control is not functioning).
- for p1215 = 1, 3 (brake the same as the sequence control) check the control sense (p0410.0).
- ensure that enable signals are present during measurement.
- remove any pulling loads from motor.
- increase max. current (p0640).
- reduce max. speed (p1082).
- suppress meas. (p1959).

For fault value = 193:

- the motor has moved through more than 5 ° electrical (r0093). Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-5 °) and then start identification.

For fault value = 194:

- switch out all supplementary torques (e.g. CI: p1511).
- for hanging/suspended axes: Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/- 1 °) and then start identification.

For fault value = 195:

- de-select closed-loop torque control (p1300 = 21 or 20, or set the signal source in p1501 to a 0 signal).

Re fault value = 200, 201:

- set pulse frequency to 0.5 x current controller frequency (e.g. 4 kHz for a current controller sampling time = 125 us).
- reduce cable length between Motor Module and motor.
- read-out measured values (r1950, r1951) and therefore determine suitable values for p1952, p1953 according to your own estimation.

7: For the characteristic measurement, the drive comes to a standstill before reaching the parameterized free distance.

8: The loop gain of the force controller is incorrect. At the positive end stop, pA (r0067) < pB (r0068).

100: Position and speed actual value inversion differ (p0410).

101: Start of measuring range > end of measuring range (p1955[0] > p1955[1]).

102: Minimum measuring travel > maximum measuring travel (p1956[0] > p1956[1]).

190: Velocity setpoint is not zero.

Remedy:

For fault value = 1:

- home the drive before calibrating the piston (p1407.3 must be = 1).

Re fault value = 2, 3:

- drive must be able to be moved.

- check system pressure and shutoff valves.

- increase the settling time (p1958[1]).

For fault value = 4:

- drive must be able to be moved.
- check system pressure and shutoff valves.

For fault value = 5:

- home the drive before the traversing range identification (p1407.3 must be = 1) and calibrate the piston (p1909.1 = 1 or p1959.2 = 1 and p1960 = 1).

For fault value = 6:

- there is an obstruction in the traversing range. If necessary, remove the obstruction. If the measuring travel with obstruction is sufficient, no measure has to be applied.
- the piston stroke was incorrectly parameterized. If the actual piston stroke is less than the parameterized stroke, correct it (p0313). A piston stroke that has been parameterized too low, is automatically corrected.

For fault value = 7:

- piston calibration was incorrectly carried out. Correct the piston calibration or automatically calibrate it (p1959.2 = 1 and p1960 = 1).
- the minimum or maximum parameterized measuring travel cannot be traversed as there is an obstruction in the path or the piston stroke was incorrectly parameterized. If required, correct the measuring travel (p1956[0], p1956[1]), correct the piston stroke or automatically calibrate it (p1959.x = 1 and p1960 = 1).
- drive cannot be traversed, because the shutoff valve does not open, the system pressure is not available, encoder or valve are not connected. Check the shutoff valve, system pressure, encoder and valve connection.

For fault value = 8:

- interchange the connectors of pressure sensors A and B or invert the direction of motion (invert p1820 and p0410) and repeat the complete moving measurement.
- check the reference values for pressure sensors (p0240, p0242).

For fault value = 100:

Set the position and speed actual value inversion the same (p0410 = 0 or p0410 = 3).

For fault value = 101:

Start of measuring range must be parameterized less than the end of measuring range (p1955[0] > p1955[1]).

For fault value = 102:

Minimum measuring travel must be parameterized less than the maximum measuring travel (p1956[0] > p1956[1]).

For fault value = 190:

During the identification, the velocity setpoint must be zero.

A07991 (N)	Drive: Motor data identification activated
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	NONE

A07991 (N)	Drive: Motor data identification activated
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The motor data identification routine is activated. The motor data identification routine is carried out at the next power-on command. If rotating measurement is selected (see p1900, p1960), it will not be possible to save the parameter assignment. Once motor data identification has been completed or de-activated, the option to save the parameter assignment will be made available again. See also: p1910

F07993	Drive: Incorrect direction of rotation of the field or encoder actual value inversion
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY
Cause:	Either the direction of the rotating field or the encoder actual value has an incorrect sign. The motor data identification automatically changed the actual value inversion (p0410) in order to correct the control sense. This can result in a direction of rotation change. Note: To acknowledge this fault, the correctness of the direction of rotation must first be acknowledged with p1910 = -2.
Remedy:	Check the direction of rotation (also for the position controller, if one is being used). If the direction of rotation is correct, the following applies: No additional measures are required (except set p1910 = -2 and acknowledge fault). If the direction of rotation is incorrect, the following applies: To change the direction of rotation, two phases must be interchanged and the motor identification routine must be repeated.

A07994 (F, N)	Drive: motor data identification not performed
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The "vector control" mode has been selected and a motor data identification has still not been performed. The alarm is initiated when changing the drive data set (see r0051) in the following cases: - vector control is parameterized in the actual drive data set (p1300 >= 20). and - motor data identification has still not been performed in the actual drive data set (see r3925). Note: For SINAMICS G120, a check is made and an alarm is output also when exiting commissioning and when the system powers up.
Remedy:	- Perform motor data identification (see p1900). - If required, parameterize "U/f control" (p1300 < 20). - switch over to a drive data set, in which the conditions do not apply.

Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The pole position identification routine was unsuccessful. Fault value (r0949, interpret decimal): 1: No current is established. 2: The starting current is not zero. 3: The selected max. distance was exceeded (p1981). 4x: The measuring signal does not permit a clear evaluation. 5: The max. current was exceeded during the measurement. 6: The current measurement must be re-calibrated. 7x: The Sensor Module does not support the pole position identification routine. 8: The pole position identification routine current required is greater than the max. current. 9: The set pole position identification routine current is zero. 10: Data set changeover during the pole position identification. 11: The encoder adjustment to determine the commutation angle is active (p1990 = 1) and the encoder without zero mark is not finely synchronized or does not have any valid data. 100: Motion-based pole position identification, 1st and 2nd measurement different. Motor blocked or current (p1993) too low. 101: Motion-based position position identification, insufficient motion, motor blocked or current (p1993) too low. 102: Motion-based pole position identification, brake is being used and is closed. The motion-based position position identification in conjunction with the brake is not permitted. 103: Motion-based pole position identification without encoder. 104: Motion-based pole position identification, speed actual value not zero after stabilizing time. 200: Elasticity-based pole position identification, internal error in the arctan calculation (0/0). 201: Elasticity-based pole position identification, too few measuring points that can be evaluated. 202: Elasticity-based pole position identification, outliers in the measurement series. 203: Elasticity-based pole position identification, maximum rotation without current. 204: Elasticity-based pole position identification, no positive edge found.

205: Elasticity-based pole position identification, the result of the Fourier transformation differs by more than 480 ° electrical / p3093 from the rough estimate.

206: Elasticity-based pole position identification, plausibility test unsuccessful.

207: Elasticity-based pole position identification, no negative measured value found.

It is possible that all measured values are identical. The expected deflection was not able to be reached, either because the expectation is too high or not enough current was able to be established.

208: Elasticity-based pole position identification, measuring current is 0.

209: Elasticity-based pole position identification, the selected max. distance was exceeded (p3095).

210: Elasticity-based pole position identification without encoder.

250 ... 260:

Elasticity-based pole position identification, more than 3 attempts have been made and fault value 200 ... 210 output.

Example:

Fault value= 253 --> more than 3 attempts have been made and fault value 203 output.

Remedy:

For fault value = 1:

- check the motor connection and DC link voltage.
- for the following parameters, set practical values that are not zero (p0325, p0329).

Re fault value = 1, 2:

- in the case of a large computing time load (e.g., 6 drives with Safety Integrated), set the computing dead time of the current controller to late transfers (p0117 = 3).

For fault value = 3:

- increase the max. distance (p1981).
- reduce the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.

For fault value = 5:

- reduce the currents for the pole position identification routine (p0325, p0329).

For fault value = 6:

- re-calibrate the Motor Module.

For fault value = 8:

- reduce the currents for the pole position identification routine (p0329, p0325, p1993).
- the power unit cannot provide the necessary pole position identification routine current (p0209 < p0329, p0325, p1993), replace the power unit with a power unit with a higher max. current.

For fault value = 9:

- enter a value not equal to zero in the pole position identification routine current (p0329, p0325, p1993).

For fault value = 10:

- do not initiate a data set changeover during the pole position identification.

For fault value = 11:

- for incremental encoders without commutation with zero mark (p0404.15 = 0), it does not make sense to adjust the encoder to determine the commutation angle (p1990 = 1). In this case, the function should be de-selected (p1990 = 0) or, for an encoder with suitable zero mark, commutation with zero mark should be selected (p0404.15 = 1).
- for absolute encoders, only adjust the encoder to determine the commutation angle (p1990 = 1) if the encoder supplies commutation information and is finely synchronized (p1992.8 = 1 and p1992.10 = 1). The encoder is possibly parked, de-activated (p0145), not ready for operation or signals a fault condition.
- de-select the encoder adjustment to determine the commutation angle (set p1990 to 0).

Re fault value = 40 ... 49:

- increase the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.
- select another technique for pole position identification routine (p1980).
- use another motor, absolute encoder or Hall sensors.

Re fault value = 70 ... 79:

- upgrade the software in the Sensor Module.

Re fault value = 100, 101:

- check and ensure that the motor is free to move.
- increase the current for motion-based pole position identification (p1993).

For fault value = 102:

- if the motor is to be operated with a brake: Select a different technique to identify the pole position (p1980).
- if the motor can be operated without a brake: Open the brake (p1215 = 2).

For fault value = 103:

- the motion-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

For fault value = 104:

- pole position identification, increase the smoothing time, motion-based (p1997).
- pole position identification, increase the rise time, motion-based (p1994).
- pole position identification, check the gain, motion-based (p1995).
- pole position identification, check the integral time, motion-based (p1996).
- for motor encoders with track A/B sq-wave (p0404.3 = 1) and flank time measurement (p0430.20 = 0), disable the integral time (p1996 = 0).

For fault value = 200:

- check parameter setting (p3090 ... p3096).

For fault value = 201:

- check parameter setting (p3090 ... p3096).
- reduce p3094.

For fault value = 202:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 203:

- check the brake or brake control.
- check the measuring current (p3096).
- increase p3094.

For fault value = 204:

- check parameter setting (p3090 ... p3096).

For fault value = 205:

- check parameter setting (p3090 ... p3096).

For fault value = 206:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 207:

- reduce the expected deflection (p3094).
- increase the measuring current (p3096).

For fault value = 208:

- set the measuring current (p3096).

For fault value = 209:

- check parameter setting p3095.
- check the brake or brake control.

For fault value = 210:

- the elasticity-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

Re fault value = 250 ... 260:

- check parameter setting (p3090 ... p3096, p1980).

F07996	Drive: Pole position identification routine not carried out

Reaction:	ENCODER (OFF2)
Acknowledge:	IMMEDIATELY
Cause:	<p>In operation, the operating mode that requires a pole position identification was changed over, which is not possible in this state.</p> <ul style="list-style-type: none">- the drive was changed over, flying, from encoderless operation to operation with encoder without having previously carried out a pole position identification for the encoder. p1404 is then at a value between zero and the max. speed and the pulses in the speed range above p1404 were enabled without a pole position ident. routine having been previously carried out in operation with encoder.- in operation, an EDS changeover was made to an encoder where it is necessary to carry out a pole position identification. However, this has still not been carried out (p1982 = 1 or 2 and p1992.7 = 0).
Remedy:	<ul style="list-style-type: none">- for a flying changeover between operation with and without encoder with pole position identification after POWER ON or commissioning (p0010 not equal to zero) enable the pulses once at zero speed. This means that the pole position identification routine is carried out and the result is available for operation.- carry out the EDS changeover with the pulses inhibited, or, before the changeover, carry out a pole position identification using this data set.

Cause:	The maximum number of valid PDO was exceeded. Alarm value (r2124, interpret decimal): 1: The total number of valid RPDO of all CANopen supported drive objects was exceeded. As a result of the hardware, the limit is 25 valid RPDO. 2: The total number of valid TPDO of all CANopen supported drive objects was exceeded. The limit is defined by the following ratio: CAN sampling time (p8848) / current controller sampling time (p0115[0]) Note: RPDO: Receive Process Data Object TPDO: Transmit Process Data Object
Remedy:	Comply with the limit for the maximum number of valid RPDO or TPDO. Apply one of the following options to delete the alarm: - POWER ON (off/on). - carry out a warm restart (p0009 = 30, p0976 = 2). - execute CANopen NMT command reset node. - change CANopen NMT state. - delete alarm buffer [0...7] (p2111 = 0). Remedy: For fault value = 0:
- Insert the correct memory card and carry out POWER ON.
Re fault value = 2, 3, 12, 13:
- contact the responsible OEM.
- Deactivate copy protection (p7765) and acknowledge the fault (p3981).
- Deactivate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981).
Note:
In general, the copy protection can only be changed when know-how protection is deactivated.

F13102 Know-how protection: Consistency error of the protected data

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Reaction: OFF1
Acknowledge: IMMEDIATELY
Cause: An error was identified when checking the consistency of the protected files. As a consequence, the project on the memory card cannot be run.
Fault value (r0949, interpret hexadecimal):
yyyyxxxx hex: yyyy = object number, xxxx = fault cause
xxxx = 1:
A file has a checksum error.
xxxx = 2:
The files are not consistent with one another.

xxxx = 3:

The project files, which were loaded into the file system via load (download from the memory card), are inconsistent.

Note:

KHP: Know-How Protection

- Remedy:**
- Replace the project on the memory card or replace project files for download from the memory card.
 - Restore the factory setting and download again.

F30001**Power unit: Overcurrent**

Message value: Fault cause: %1 bin

Message class: Power electronics faulted (5)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected an overcurrent condition.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging currents for voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at power-up due to the missing line reactor.
- power cables are not correctly connected.
- the power cables exceed the maximum permissible length.
- power unit defective.
- line phase interrupted.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (powered down) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

Bit 3: Overcurrent in the DC link.

Note:

Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).

- Remedy:**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star/delta).
 - U/f operation: Increase up ramp.
 - U/f operation: Check the assignment of the rated currents of the motor and Motor Module.
 - infeed: Check the line supply quality.
 - infeed: Reduce the motor load.
 - infeed: Check the correct connection of the line filter and the line commutating reactor.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.
 - check the line supply phases.

For a parallel switching device (r0108.15 = 1) the following additionally applies:

- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

Cause: The power unit has detected an undervoltage condition in the DC link.
- line supply failure
- line supply voltage below the permissible value.
- line supply infeed failed or interrupted.
- line phase interrupted.
Note:
The monitoring threshold for undervoltage in the DC link is indicated in r0296.
Remedy:
- check the line supply voltage
- check the line supply infeed and observe the fault messages relating to it (if there are any)
- check the line supply phases.
- check the line supply voltage setting (p0210).
- booksized units: check the setting of p0278.
Note:
The ready signal for the infeed (r0863) must be interconnected to the associated drive inputs (p0864).

Cause: The temperature of the power unit heat sink has exceeded the permissible limit value.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.
Fault value (r0949):
Temperature [1 bit = 0.01 °C].
Remedy:
- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.
Notice:
This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.

Message value: -
Message class: Power electronics faulted (5)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The Thyristor Control Board (TCB) of the Basic Line Module signals a fault.
- there is no line supply voltage.
- the line contactor is not closed.
- the line supply voltage is too low.
- line supply frequency outside the permissible range (45 ... 66 Hz).
- there is a DC link short-circuit.
- there is a DC link short-circuit (during the pre-charging phase).
- voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V.
- there is an internal fault in the Thyristor Control Board.

Remedy: The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s!

- check the line supply voltage
- check or energize the line contactor.
- check the monitoring time and, if required, increase (p0857).
- if required, observe additional power unit messages/signals.
- check the DC link regarding short-circuit or ground fault.
- evaluate diagnostic LEDs for the Thyristor Control Board.

Message value: %1

Message class: Network fault (2)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (OFF1)

Acknowledge: IMMEDIATELY

Cause: At the power unit, the DC link voltage ripple has exceeded the permissible limit value.
Possible causes:

- A line phase has failed.
- The 3 line phases are inadmissibly unsymmetrical.
- The capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.
- the fuse of a phase of a main circuit has ruptured.
- A motor phase has failed.

Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.

Remedy:

- check the main circuit fuses.
- Check whether a single-phase load is distorting the line voltages.
- Detune the resonant frequency with the line inductance by using an upstream line reactor.
- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.
- check the motor feeder cables.

Cause:	The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit. For infeed units, the following applies: <ul style="list-style-type: none">- closed-loop control is incorrectly parameterized.- load on the infeed is too high.- Voltage Sensing Module incorrectly connected.- line reactor missing or the incorrect type.- power unit defective.

4 Faults and alarms

4.2 List of faults and alarms

The following applies to Motor Modules:

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):

Bit 0: Phase U

Bit 1: Phase V

Bit 2: Phase W

Remedy:

For infeed units, the following applies:

- check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5)
- reduce the load and increase the DC-link capacitance or use a higher-rating infeed if necessary
- check the connection of the optional Voltage Sensing Module
- check the connection and technical data of the line reactor
- check the power cables for short-circuit or ground fault.
- replace power unit.

The following applies to Motor Modules:

- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

F30017	Power unit: 26.5 V supply voltage fault
Message value:	%1
Message class:	Power electronics faulted (5)
Drive object:	HLA
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	For a drive that has been enabled, it has been identified that the 26.5 V supply voltage for the Hydraulic Module has a fault (X271). Permissible range: 26.0 ... 27.0 V Fault value (r0949, interpret decimal): Voltage value [0.1 V].
Remedy:	- check the 26.5 V supply voltage (X271).

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A configuration is requested that is not supported by the power unit. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: xxxx = fault cause, yyyy = additional information (internal Siemens) xxxx = 0: Autonomous operation is requested but is not supported. xxxx = 1: The requested DRIVE-CLiQ timing is not permissible. xxxx = 2: A PM260 has been detected with PS-ASIC version 2. This combination is not supported. xxxx = 3: Initialization was not able to be successfully completed. It is possible that the Control Unit was withdrawn from the power module before or during power-up. xxxx = 4: The combination of power unit and Control Unit or Control Unit Adapter is not supported. xxxx = 5: The higher current controller dynamic performance is not supported.

Remedy:

Re fault cause = 0:
If required, deactivate an active internal voltage protection (p1231).

Re fault cause = 1:
Update the Control Unit firmware or change the DRIVE-CLiQ topology.

Re fault cause = 2:
Replace the power unit with a PM260 with PS-ASIC version 3 (or higher).

Re fault cause = 3, 4:
Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Units Adapter.

Re fault cause = 5:
- use a booksize format power unit.
- for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.
- If required, de-select the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller.

Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Power unit has detected a ground fault. Possible causes: - ground fault in the power cables. - Ground fault at the motor. - CT defective. - when the brake closes, this causes the hardware DC current monitoring to respond. - short-circuit at the braking resistor. - the closed-loop circulating current control for devices connected in parallel (r0108.15 = 1) is either too slow or has been set too fast. Note: For power units, a ground fault is also emulated in r3113.5. Fault value (r0949, interpret decimal): 0: - the hardware DC current monitoring has responded. - short-circuit at the braking resistor. > 0: Absolute value, total current amplitude [20479 = r0209 * 1.4142].
Remedy:	- check the power cable connections. - check the motor. - check the CT. - check the cables and contacts of the brake connection (a wire is possibly broken). - check the braking resistor. For parallel switching devices (r0108.15 = 1) the following additionally applies: - check the ground fault monitoring thresholds (p0287). - check the setting of the closed-loop circulating current control (p7036, p7037). Bit 13: Vce fault detected, transistor de-saturated due to overcurrent/short-circuit. Bit 14: Undervoltage detected.</p> <p>See also: p0210 (Drive unit line supply voltage)</p>

Remedy:

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).

For booksize drive units, the following applies:

- wait (approx. 8 minutes) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

Re 5):

- carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual).

Re 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual)

Re 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

Re 8):

- check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge.

Re 9):

- check the DC link for ground faults or short circuits.

Re 11):

- Check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).

If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

Cause: The maximum operating time of at least one fan will soon be reached, or has already been exceeded.
Fault value (r0949, interpret binary):
Bit 0: heat sink fan will reach the maximum operating time in 500 hours.
Bit 1: heat sink fan has exceeded the maximum operating time.
Bit 8: internal device fan will reach the maximum operating time in 500 hours.
Bit 9: internal device fan has exceeded the maximum operating time.
Note:
The maximum operating time of the heat sink fan in the power unit is displayed in p0252.
The maximum operating time of the internal device fan in the power unit is internally specified and is fixed.
Remedy:
For the fan involved, carry out the following:
- replace the fan.
- reset the operating hours counter (p0251, p0254).

Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	An overcurrent condition has occurred in the braking chopper.
Remedy:	- check whether the braking resistor has a short circuit. - for an external braking resistor, check whether the resistor may have been dimensioned too small.
Note:	The braking chopper is only enabled again at pulse enable after the fault has been acknowledged.
A30057	Power unit: Line asymmetry
Message value:	%1
Message class:	Network fault (2)
Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011.

Cause:	The power unit has detected an excessive rate of rise in the overvoltage range. - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: rated current of motor much greater than that of power unit. - infeed: High discharge and post-charging currents for voltage dip. - infeed: High post-charging currents for overload when motoring and DC link voltage dip. - infeed: Short-circuit currents at power-up due to the missing line reactor. - power cables are not correctly connected. - power cables exceed the maximum permissible length. - power unit defective. Additional causes for a parallel switching device (r0108.15 = 1): - a power unit has tripped (powered down) due to a ground fault. - the closed-loop circulating current control is either too slow or has been set too fast. Fault value (r0949, interpret bitwise binary): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W.
Remedy:	- check the motor data - if required, carry out commissioning. - check the motor circuit configuration (star-delta) - U/f operation: Increase up ramp. - U/f operation: Check assignment of rated currents of motor and power unit. - infeed: Check the line supply quality. - infeed: Reduce the motor load. - infeed: Correct connection of the line reactor. - check the power cable connections. - check the power cables for short-circuit or ground fault. - check the length of the power cables. - replace power unit. For a parallel switching device (r0108.15 = 1) the following additionally applies: - check the ground fault monitoring thresholds (p0287). - check the setting of the closed-loop circulating current control (p7036, p7037).

Cause:

The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the crosswise data comparison between the two monitoring channels and has initiated a STOP F.

As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).

Fault value (r0949, interpret decimal):

0: Stop request from the Control Unit.

1000: Reference and actual checksum in monitoring channel 2 are not identical (booting).

- as a result of the changed current controller sampling time (p0115[0]), the clock cycle time for the Safety Integrated Basic Functions (r9880) was adapted.

- Safety parameters set offline and loaded into the Control Unit.

- a download was made to the SINAMICS, whose firmware versions in monitoring channel 2 did not correspond to the latest version. The request to switch off the DRIVE-CLiQ component A1007 was present after the download.

Cause:

The drive-integrated "Safety Integrated" function requires synchronization of the safety time slices in both monitoring channels. This synchronization routine was unsuccessful.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module/Hydraulic Module software.

- upgrade the Control Unit software.

Cause:	When accessing the Safety Integrated parameters for monitoring channel 2 in the non-volatile memory, an error has occurred. Note: This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

129:

- safety parameters for monitoring channel 2 corrupted.
- drive with enabled safety functions was possibly copied offline using the commissioning software and the project downloaded.

131: Internal software error on the Control Unit.

255: Internal Motor Module/Hydraulic Module software error.

Remedy:

- re-commission the safety functions.
- upgrade the Control Unit software.
- upgrade the Motor Module/Hydraulic Module software.
- replace the memory card or Control Unit.

For fault value = 129:

- activate the safety commissioning mode (p0010 = 95).

F30684**SI Motion P2: Safely limited position limit values interchanged**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: For the function "Safely Limited Position" (SLP), a lower value is in p9334 than in p9335.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

1: Limit values SLP1 interchanged.

2: Limit values SLP2 interchanged.

See also: p9334, p9335

Remedy:
- correct the lower and upper limit values (p9335, p9334).
- carry out a POWER ON (power off/on).

Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	- It is not permissible to enable actual value synchronization for a 1-encoder system. - It is not permissible to simultaneously enable actual value synchronization and a monitoring function with absolute reference (SCA/SLP). - It is not permissible to simultaneously enable actual value synchronization and safe position via PROFIsafe. Note: This fault results in a STOP A that cannot be acknowledged.
Remedy:	- Either select the "actual value synchronization" function or parameterize a 2-encoder system. - Either de-select the function "actual value synchronization" or the monitoring functions with absolute reference (SCA/SLP) and carry out a POWER ON. - Either deselect the "actual value synchronization" function or do not enable "Safe position via PROFIsafe". Cause: Safety parameters have been changed; these will only take effect following a warm restart or POWER ON.

Notice:

All changed parameters of the safety motion monitoring functions will only take effect following a warm restart or POWER ON.

Alarm value (r2124, interpret decimal):

Parameter number of the safety parameter which has changed, necessitating a warm restart or POWER ON.

Remedy:

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).

Remedy:

Re message value = 1002:

- Perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

Re message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- Increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

Re message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

Re message value = 1005:

- For safe motion monitoring functions without encoder: check the conditions for pulse enable.
- For safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a power module, the test stop should always be performed for pulse enable (independent of whether with encoder or without encoder).

Re message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.

- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- For a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.

- For DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (power off/on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

Re message value = 1024:

- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (power off/on) for all components.
- replace the hardware.

Re message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.
- if monitoring function is active, issue "SLS" pulse enable within 5 s of de-selecting STO.

C30770	SI Motion P2: Discrepancy error of the fail-safe inputs/outputs
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex xxxx: Discrepancy error for fail-safe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for fail-safe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.
Remedy:	- check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe. Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked: - $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10002 \geq p9500$ (discrepancy time must be no less than p9500) - $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply) td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9500). tp = period for a switching operation in ms.

4 Faults and alarms

4.2 List of faults and alarms

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10002 < p10017 + 1 \text{ ms} - td$

- $p10002 > td$

- $p10002 \geq p9500$

Example:

For a 12 ms SI monitoring cycle and a switching frequency of 110 ms ($p10017 = 0$), the maximum discrepancy time which can be set is as follows:

$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$

Rounded-off, $p10002 \leq 36 \text{ ms}$ is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).

Message class: Safety monitoring channel has identified an error (10)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: A fault has occurred on the MM side during the test stop for the fail-safe outputs.

Fault value (r0949, interpret hexadecimal):

RRRVWXYZ hex:

R: Reserved.

V: Actual state of the DO channel concerned (see X) on the CU (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).

W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).

X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).

Y: Reason for the test stop fault.

Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault

Y = 1: MM side in incorrect test stop state (internal fault).

Y = 2: Expected states of the DOs were not fulfilled (CU305: readback via DI 22 / CU240 readback DI 2).

Y = 3: Incorrect timer state on CU side (internal fault)

Y = 4: Expected states of the diag DOs were not fulfilled (CU305: internal readback on MM channel).

Y = 5: Expected states of the second diag DOs were not fulfilled (CU305: internal readback on CU channel).

X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).

In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions
Z = 0 ... 3: Synchronization phase of test stop between CU and Motor Module no switching operations
Z = 4: DO + OFF and DO - OFF
Z = 5: Check to see if states are as expected
Z = 6: DO + ON and DO - ON

13: -/1/1/-

Example:

Fault F01773 (CU) is signaled with fault value = 0001_0127 and fault F30773 (MM) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

Remedy:

Check the wiring of the F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

In the event of multiple test stop faults, the first one that occurred is shown.

Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

4 Faults and alarms

4.2 List of faults and alarms

F30845	Power unit DRIVE-CLiQ: Cyclic data transfer error
Message value:	Component number: %1, fault cause: %2
Message class:	Internal (DRIVE-CLiQ) communication error (12)
Drive object:	A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A DRIVE-CLiQ communication error has occurred from the Control Unit to the power unit concerned. Fault cause: 11 (= 0B hex): Synchronization error during alternating cyclic data transfer. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	Carry out a POWER ON (power off/on). See also: p9916 (DRIVE-CLiQ data transfer error shutdown threshold slave)

F30850	Power unit: Internal software error
Message value:	%1
Message class:	Hardware / software error (1)
Drive object:	A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: OFF1 (NONE, OFF2) Servo: OFF1 (NONE, OFF2, OFF3) Vector: OFF1 (NONE, OFF2, OFF3) Hla: OFF1 (NONE, OFF2, OFF3)
Acknowledge:	POWER ON
Cause:	An internal software error has occurred in the power unit. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- replace power unit. - if required, upgrade the firmware in the power unit. - contact the Hotline.

F30851	Power unit DRIVE-CLiQ (CU): Sign-of-life missing
Message value:	Component number: %1, fault cause: %2
Message class:	Internal (DRIVE-CLiQ) communication error (12)
Drive object:	A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: OFF2 (NONE, OFF1) Servo: OFF2 (NONE, OFF1, OFF3) Vector: OFF2 (NONE, OFF1, OFF3) Hla: OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	A DRIVE-CLiQ communication error has occurred from the power unit to the Control Unit involved. The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit. Fault cause: 10 (= 0A hex): The sign-of-life bit in the receive telegram is not set. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	Upgrade the firmware of the component involved.

A30853	Power unit: Sign-of-life error cyclic data
Message value:	-
Message class:	General drive fault (19)
Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The power unit has detected that the cyclic setpoint telegrams of the Control Unit have not been updated on time. At least two sign-of-life errors have occurred within the window set in p7788.
Remedy:	- check the electrical cabinet design and cable routing for EMC compliance - reduce the size of the window (p7788) for monitoring.
F30860	Power unit DRIVE-CLiQ (CU): Telegram error
Message value:	Component number: %1, fault cause: %2
Message class:	Internal (DRIVE-CLiQ) communication error (12)
Drive object:	A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A DRIVE-CLiQ communication error has occurred from the power unit to the Control Unit involved. Fault cause: 1 (= 01 hex): Checksum error (CRC error). 2 (= 02 hex): Telegram is shorter than specified in the length byte or in the receive list. 3 (= 03 hex): Telegram is longer than specified in the length byte or in the receive list. 4 (= 04 hex): The length of the receive telegram does not match the receive list. 5 (= 05 hex): The type of the receive telegram does not match the receive list. 6 (= 06 hex): The address of the power unit in the telegram and in the receive list do not match. 9 (= 09 hex): The error bit in the receive telegram is set. 16 (= 10 hex): The receive telegram is too early. 17 (= 11 hex): CRC error and the receive telegram is too early. 18 (= 12 hex): The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early. 19 (= 13 hex): The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early. 20 (= 14 hex): The length of the receive telegram does not match the receive list and the receive telegram is too early. 21 (= 15 hex): The type of the receive telegram does not match the receive list and the receive telegram is too early. 22 (= 16 hex): The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early. 25 (= 19 hex): The error bit in the receive telegram is set and the receive telegram is too early. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (power off/on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

F30875 Power unit DRIVE-CLiQ (CU): Supply voltage failed

Message value: Component number: %1, fault cause: %2

Message class: Supply voltage fault (undervoltage) (3)

Drive object: A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

Fault cause:

9 (= 09 hex):

The power supply voltage for the components has failed.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (power off/on).
- check the power supply voltage wiring for the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the power supply for the DRIVE-CLiQ component.

F30885 CU DRIVE-CLiQ (CU): Cyclic data transfer error

Message value: Component number: %1, fault cause: %2

Message class: Internal (DRIVE-CLiQ) communication error (12)

Drive object: A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A DRIVE-CLiQ communication error has occurred from the power unit to the Control Unit involved.

The nodes do not send and receive in synchronism.

Fault cause:

26 (= 1A hex):

Sign-of-life bit in the receive telegram not set and the receive telegram is too early.

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

98 (= 62 hex):

Error at the transition to cyclic operation.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the power supply voltage of the component involved.
- carry out a POWER ON.
- replace the component involved.

Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	Fault detected on the DRIVE-CLiQ component (power unit) involved. Faulty hardware cannot be excluded. Fault cause: 32 (= 20 hex): Error in the telegram header. 35 (= 23 hex): Receive error: The telegram buffer memory contains an error. 66 (= 42 hex): Send error: The telegram buffer memory contains an error. 67 (= 43 hex): Send error: The telegram buffer memory contains an error. 96 (= 60 hex): Response received too late during runtime measurement. 97 (= 61 hex): Time taken to exchange characteristic data too long. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...). - check the electrical cabinet design and cable routing for EMC compliance - if required, use another DRIVE-CLiQ socket (p9904). - replace the component involved.

F30895	PU DRIVE-CLiQ (CU): Alternating cyclic data transfer error
Message value:	Component number: %1, fault cause: %2
Message class:	Internal (DRIVE-CLiQ) communication error (12)
Drive object:	A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Acknowledge:	IMMEDIATELY
Cause:	The properties of the DRIVE-CLiQ component (power unit), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
Remedy:	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

F30899 (N, A)	Power unit: Unknown fault

F31100 (N, A)	Encoder 1: Zero mark distance error
Message value:	%1
Message class:	Position/speed actual value incorrect or not available (11)
Drive object:	A_INF, B_INF, ENC, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: NONE (OFF1, OFF2) Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2) Vector: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2) Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

Cause:	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse). See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the clearance between zero marks (p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - when p0437.1 is active, check p4686. - replace the encoder or encoder cable.

Cause:	The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign) The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV). The signal level is not evaluated unless the following conditions are satisfied: - Sensor Module properties available (r0459.31 = 1). - Monitoring active (p0437.31 = 1). See also: p0491 (Motor encoder fault response ENCODER)

Remedy:	<ul style="list-style-type: none"> - check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - check the encoder type (encoder with zero marks). - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly. - replace the encoder cable. - if the coding disk is soiled or the lighting aged, replace the encoder.

Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check whether the coding disk is dirty or there are strong ambient magnetic fields.
- adapt the parameter for the clearance between zero marks (p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).

Cause:

The encoder supplies status information bit by bit in an internal status/fault word.

Some of these bits cause this fault to be triggered. Other bits are status displays. The status/fault word is displayed in the fault value.

Note regarding the bit designation:

The first designation is valid for DRIVE-CLiQ encoders, the second for EnDat 2.2 encoders.

Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). Cause: The amplitude ($C^2 + D^2$) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track D (16 bits with sign).

xxxx = Signal level, track C (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- check the Hall sensor box.

Cause: The amplitude (root of $A^2 + B^2$) for encoder 1 exceeds the permissible tolerance.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = Amplitude, i.e. root from $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.

Cause:	For the actual value sensing, an error was detected. As a result of this error, it must be assumed that the actual value sensing supplies an incorrect coarse position. Alarm value (r2124, interpret decimal): 3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.
Remedy:	Re alarm value = 3: - For a standard encoder with cable, contact the manufacturer where relevant. - correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.

Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

A31811 (F, N) Encoder 1: Encoder serial number changed

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, ENC, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

- The encoder was replaced.

Cause 2:

- A third-party, built-in or linear motor was re-commissioned.

Cause 3:

- The motor with integrated and adjusted encoder was replaced.

Cause 4:

- The firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2118, p2119).

Remedy:	Re causes 1, 2: Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed. SERVO: If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated. or Set the adjustment via p0431. A31999 (F, N) Encoder 1: Unknown alarm

Message value: New message: %1
Message class: Position/speed actual value incorrect or not available (11)
Drive object: A_INF, B_INF, ENC, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE
Acknowledge: NONE
Cause: A alarm has occurred on the Sensor Module for encoder 1 that cannot be interpreted by the Control Unit firmware.
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.
Alarm value (r2124, interpret decimal):
Alarm number.

Note:

If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.
See also: p0491 (Motor encoder fault response ENCODER)

Remedy:
- replace the firmware on the Sensor Module by an older firmware version (r0148).
- upgrade the firmware on the Control Unit (r0018).

F32100 (N, A) Encoder 2: Zero mark distance error

Message value: %1

Message class: Position/speed actual value incorrect or not available (11)

Vector: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance.
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.

The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).

Fault value (r0949, interpret decimal):

Last measured zero mark distance in increments (4 increments = 1 encoder pulse).

The sign designates the direction of motion when detecting the zero mark distance.

Remedy:
- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).
- adapt the parameter for the distance between zero marks (p0424, p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).
- replace the encoder or encoder cable.

Cause: The 1.5 x parameterized zero mark distance was exceeded.
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
Fault value (r0949, interpret decimal):
Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).

Acknowledge: IMMEDIATELY

Cause: The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 2. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)

The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.

The response threshold for the differential signal level of the encoder is < -1600 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).

- Monitoring active (p0437.31 = 1).

Remedy:

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range

- check that the encoder cables and shielding are routed in compliance with EMC.

- check the plug connections and contacts of the encoder cable.

- check the encoder type (encoder with zero marks).

- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.

- replace the encoder cable.

- if the coding disk is soiled or the lighting aged, replace the encoder.

F32129 (N, A) Encoder 2: Position difference hall sensor/track C/D and A/B too large

Message value: %1
Message class: Position/speed actual value incorrect or not available (11)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
 Vector: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
 Hla: OFF1 (NONE, OFF2, OFF3)

Acknowledge: PULSE INHIBIT

Cause: The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.
 One period of track C/D corresponds to 360 ° mechanical.
 One period of the Hall signal corresponds to 360 ° electrical.
 The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.
 After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A32429.
 Fault value (r0949, interpret decimal):
 For track C/D, the following applies:
 Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).
 For Hall signals, the following applies:
 Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).

Remedy:

- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

Acknowledge: PULSE INHIBIT

Cause: After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.
 When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.
 When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.
 Fault value (r0949, interpret hexadecimal):
 yyyyxxxx hex
 yyyy: Determined mechanical zero mark position (can only be used for track C/D).
 xxxx: Deviation of the zero mark from the expected position as electrical angle.

F32131 (N, A) Encoder 2: Deviation position incremental/absolute too large

Message value: %1

Message class: Position/speed actual value incorrect or not available (11)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Vector: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause: Absolute encoder:

When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).

- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

Remedy:

- check that the encoder cables are routed in compliance with EMC.

- check the plug connections.

- replace the encoder or encoder cable.

- check whether the coding disk is dirty or there are strong ambient magnetic fields.

- adapt the parameter for the clearance between zero marks (p0425).

- if message output above speed threshold, reduce filter time if necessary (p0438).

Cause: For the actual value sensing, an error was detected. As a result of this error, it must be assumed that the actual value sensing supplies an incorrect coarse position.
Alarm value (r2124, interpret decimal):
3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.

Remedy:	Re alarm value = 3: - For a standard encoder with cable, contact the manufacturer where relevant. - correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.

Cause:	The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical. One period of track C/D corresponds to 360 ° mechanical. One period of the Hall signal corresponds to 360 ° electrical. The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough. Alarm value (r2124, interpret decimal): For track C/D, the following applies: Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °). Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The position tracking for the measuring gear cannot be reset.
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.

Vector: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Hla: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause:
The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 3.
The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot.
Fault value (r0949, interpret hexadecimal):
yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)
The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.
The response threshold for the differential signal level of the encoder is < -1600 mV.
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).

- Monitoring active (p0437.31 = 1).

Remedy:

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range

- check that the encoder cables and shielding are routed in compliance with EMC.

- check the plug connections and contacts of the encoder cable.

- check the encoder type (encoder with zero marks).

- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.

- replace the encoder cable.

- if the coding disk is soiled or the lighting aged, replace the encoder.

Acknowledge: PULSE INHIBIT

Cause: Absolute encoder:

When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).

- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

- check the plug connections.

- replace the encoder or encoder cable.

- check whether the coding disk is dirty or there are strong ambient magnetic fields.

- adapt the parameter for the clearance between zero marks (p0425).

A33400 (F, N)	Encoder 3: Alarm threshold zero mark distance error

Message class:	Position/speed actual value incorrect or not available (11)
Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.

The response threshold is < 230 mV (observe the frequency response of the encoder). A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec. The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B. Note for Sensor Modules for resolvers (e.g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms). A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec. Note: The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.
Remedy:	- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range. - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check the Sensor Module (e.g. contacts). - if the coding disk is soiled or the lighting aged, replace the encoder.

Reaction: NONE

Cause: For the actual value sensing, an error was detected. As a result of this error, it must be assumed that the actual value sensing supplies an incorrect coarse position.
Alarm value (r2124, interpret decimal):
3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.

Remedy:	Re alarm value = 3: - For a standard encoder with cable, contact the manufacturer where relevant. - correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.

Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

	Bit 0, 1: Up to 6SL3055-0AA00-5*A0
	Bits 2 ... 20: 6SL3055-0AA00-5*A1 and higher
Remedy:	Acknowledge fault.
	If the fault cannot be acknowledged:
	Bits 2 ... 9: Check encoder power supply.
	Bits 2 ... 14: Check the corresponding cable.
	Bit 15 with no other bits: Check track R, check settings in p0404.

A33811 (F, N)	Encoder 3: Encoder serial number changed
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders). - The encoder was replaced.
	Note:
	With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2). When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).
	Proceed as follows to hide serial number monitoring: - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.
Remedy:	Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

 Vector: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
 Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause: A parameter of encoder 3 was detected as being incorrect.
 It is possible that the parameterized encoder type does not match the connected encoder.
 The parameter involved can be determined as follows:
 - determine the parameter number using the fault value (r0949).
 - determine the parameter index (p0187).
 Fault value (r0949, interpret decimal):
 yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter
 xxxx = 421:
 For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.
 yyyy = 0:
 No information available.
 yyyy = 1:
 The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).
 yyyy = 2:
 A code number for an identified encoder has been entered into p0400, however, no identification was carried out.
 Please start a new encoder identification.
 yyyy = 3:
 A code number for an identified encoder has been entered into p0400, however, no identification was carried out.
 Please select a listed encoder in p0400 with a code number < 10000.
 yyyy = 4:
 This component does not support SSI encoders (p0404.9 = 1) without track A/B.
 yyyy = 5:
 For SQW encoder, value in p4686 greater than in p0425.
 yyyy = 6:
 DRIVE-CLiQ encoder cannot be used with this firmware version.
 yyyy = 7:
 For an SQW encoder, the Xact1 correction (p0437.2) is only permitted with equidistant zero marks.
 yyyy = 8:
 The motor pole pair width is not supported by the linear scale being used.
 yyyy = 9:
 The length of the position in the EnDat protocol may be a maximum of 32 bits.
 yyyy = 10:
 The connected encoder is not supported.
 yyyy = 11:

Remedy:

- check whether the connected encoder type matches the encoder that has been parameterized.
- correct the parameter specified by the fault value (r0949) and p0187.
- re parameter number = 314:
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 * p0433) / p0432 <= 1000).

Cause: The selected device combination is not supported.

Fault value (r0949, interpret decimal):

1003:

The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2^n .

1005:

The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.

1006:

The maximum duration (31.25 μ s) of the EnDat transfer was exceeded.

2001:

The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.

2002:

The resolution of the linear measuring unit does not match the pole pair width of the linear motor

Remedy: Re fault value = 1003, 1005, 1006:

- Use a measuring unit that is permissible.

For fault value = 2001:

- Set a permissible cycle combination (if required, use standard settings).

For fault value = 2002:

- Use a measuring unit with a lower resolution (p0422).

4.2 List of faults and alarms

Remedy: - acknowledge all faults on the Control Unit (BI: p2102).
or
- acknowledge all faults on the drive object TM54F (BI: p2103, p2104 or p2105).
Note:
A fault acknowledgement is triggered with a 0/1 signal.

F35004**TM54F: communication cycle invalid**

Message value: Fault cause: %1 bin

Message class: Safety monitoring channel has identified an error (10)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: - the communication cycle specified in p10000[x] does not correspond with the monitoring cycle of the drive object which was specified in p10010[x].
As long as this fault is present, fail safe values are activated in TM54F. All the drives are not enabled.
Fault value (r0949, interpret binary):

If a bit is set in the range bit 0 ... 5, then the following applies:

The communication cycle specified in p10000[x] does not correspond with the monitoring cycle of the drive object which was specified in p10010[x]. (if only p10000[0] used, then this value must be identical with all monitoring cycles of the drive objects used in p10010[0..5].)

Bit 0 = 1 : p10000[0] does not correspond with the monitoring cycle of p10010[0]

Bit 1 = 1 : p10000[1] does not correspond with the monitoring cycle of p10010[1]

...

Bit 5 = 1 : p10000[5] does not correspond with the monitoring cycle of p10010[5]

If a bit is set in the range bit 16 ... 21, then the following applies:

Bit 16 = 1 : p10000[0] has been selected too low.

Bit 17 = 1 : p10000[1] has been selected too low.

...

Bit 21 = 1 : p10000[5] has been selected too low.

When using an axis with Basic Safety Functions with TM54F, then the monitoring cycle should be greater than 500us + 8*current controller clock cycles of the drive.

-this error is also signaled if a drive controlled with TM54F is parameterized so that the basic functions are controlled via TM54F and simultaneously extended safety functions or ncSI have been parameterized.

- the following applies for fault value 0:

Since the firmware update of the TM54F it has not been switched off.

Or, the connected TM54F has firmware that is too old.

See also: p10010 (SI TM54F drive object assignment)

Remedy: For a fault value in the range from bit 0 ... 5:

- First check that all drives are entered in p10010, extended safety functions or basic functions have been enabled via TM54F.
- Execute the copy function for TM54F(p9700 = 87).
- adapt the checksums for TM54F(p9701 = 172).
- copy RAM to ROM.
- carry out a POWER ON.

For a fault value in the range from bit 16 ... 21:

Increase the current controller sampling time of the corresponding drive, in order to avoid faults in operation.

- Execute the copy function for TM54F(p9700 = 87).
- adapt the checksums for TM54F(p9701 = 172).
- copy RAM to ROM.
- carry out a POWER ON.

F35006	TM54F: drive groups invalid
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	POWER ON
Cause:	The functionality of the basic functions via TM54F is used. Drive groups have been incorrectly parameterized (incorrect parameter assignment). Fault value (r0949, interpret binary): The value specifies in which drive group Basic Safety drives are mixed with Extended Safety drives. Bit 0 = 1 : drive group 1 error Bit 1 = 1 : drive group 2 error Bit 2 = 1 : drive group 3 error Bit 3 = 1 : drive group 4 error
	As long as this fault is present, fail safe values are activated in TM54F. All the drives are not enabled.
	Note: -this error is also signaled if a drive controlled with TM54F is parameterized so that the basic functions are controlled via TM54F and simultaneously extended safety functions or ncSI have been parameterized.
Remedy:	Corresponding to the fault value, p10011 should be checked to ensure that no Basic Safety drives are mixed with Extended Safety drives in a drive group.
F35009	TM54F: Safety commissioning drive incomplete
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	In the configuration of the TM54F, a drive object of the TM54F was assigned, that has no safety functions or has incorrectly parameterized safety functions. The fault value specifies which drive (refer to p10010) has been incorrectly parameterized (p9601 p9501). Bit 0 = 1 : drive 1 error Bit 1 = 1 : drive 2 error Bit 2 = 1 : drive 3 error Bit 3 = 1 : drive 4 error Bit 4 = 1 : drive 5 error Bit 5 = 1 : drive 6 error
Remedy:	Carry out the safety commissioning of the drive involved and enable the safety functions for TM54F. Then commission the TM54F and then just set p9700=87d and p9701=172d.

Cause:	An error was detected when carrying out the test stop on the TM54F. Failsafe control signals (failsafe values) are transferred to the safety functions. Fault value (r0949, interpret hexadecimal): aaaabbcc hex: aaaa: DO or F-DI (dependent on test step cc), where the expected state was not assumed (bit 0 = F-DI 0 or F-DO 0, bit 1 = F-DI 1 or F-DO 1, etc.). bb: Fault cause bb = 01 hex: Internal fault. bb = 02 hex: Fault when comparing the switching signals of the two channels (F-DI or DI). bb = 03 hex: Internal fault. bb = 04 hex: Fault when comparing the switching signals of the two channels (Diag-DO). cc: State of the test stop in which the fault has occurred.  C5 hex: End of test

The expected states to be checked depend on the parameterized test mode (p10047).

The following expected states are tested in the test steps when testing the F-DOs:

The display format is as follows:

Test step (SL MA): Expected Diag-DO mode 1 | Expected DI 20 ... 23 mode 2 | Expected DI 20 ... 23 mode 3

(4C hex 57 hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

(62 hex 6D hex): Diag-DO = 0 V | DI = 0 V | DI = 0 V

(78 hex 83 hex): Diag-DO = 0 V | DI = 0 V | DI = 24 V

(8E hex 99 hex): Diag-DO = 24 V | DI = 0 V | DI = 24 V

(A4 hex AF hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

Example:

If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.

Master signals fault value 0001_04AF and slave signals fault value 0001_04A4.

aaaa = 1 --> F-DO 0 is involved.

bb = 04 hex --> the test of the Diag-DO was unsuccessful.

cc = The expected states were tested in test stop step AF on the master and A4 on the slave.

The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V.

The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

Remedy:

Check the wiring of the F-DIs and F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:

These fault values occur together with fault F35152. In this case, all parameters for the test stop should be checked.

You should also check whether the firmware version of the TM54F matches that of the Control Unit.

You also need to check p10001, p10017, p10046 and p10047.

A POWER ON must be carried out after correcting the parameters.

cc: indicates the index of the data to be cross-compared that resulted in the error.

Remedy:

Carry out the following steps on the TM54F:

- check the specified parameters for incorrect parameterization.
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for SI parameters (p9700 = 57 hex).
- acknowledge complete data change (p9701 = AC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1).
- carry out safe acknowledgment (p10006).

For an internal software error (aaaa > 0):

- For TM54F, upgrade the firmware to a later version.
- contact the Hotline.
- replace the TM54F.

Cause:	A communication error between the TM54F master and Control Unit or between the TM54F slave and the Motor Module/Hydraulic Module was detected. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.

4 Faults and alarms

4.2 List of faults and alarms

Remedy: When replacing a Motor Module/Hydraulic Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following always applies:

- check the electrical cabinet design and cable routing for EMC compliance
- upgrade the software on the TM54F.
- contact the Hotline.
- replace the TM54F.

TM54F: Discrepancy error

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The safety input terminals or output terminals show a different state longer than that parameterized in p10002.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex

xxxx: The safety-relevant input terminals F-DI indicate a discrepancy.

Bit 0: Discrepancy for F-DI 0

...

Bit 9: Discrepancy for F-DI 9

yyyy: The safety-relevant output terminals F-DO indicate a discrepancy.

Bit 0: Discrepancy for F-DO 0

...

Bit 3: Discrepancy for F-DO 3

Note:

If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.

The following options are available to analyze all of the discrepancy errors:

- Using the commissioning software, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here.
- Compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.

Remedy: Check the wiring of the corresponding F-DI (contact problems).

Discrepancy errors in the fail-safe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgement was carried out (see p10006). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally.

Sets the discrepancy time for cyclic switching operations at the F-DIs:

For cyclic switching operations at the fail-safe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:

- $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
- $p10002 \geq p10000$ (discrepancy time must be no less than p10000)
- $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td: possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI sampling cycle (see p10000).

tp: period for a switching operation in ms.

For cyclic switching operations and when debounce (p10017) is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10002 < p10017 + 1\text{ms} - td$

- $p10002 > td$

- $p10002 \geq p10000$

Example:

If the SI sampling cycle is 12 ms and the switching frequency is 110 ms ($p10017 = 0$), the maximum discrepancy time which can be set is as follows:

$p10002 \leq 110/2\text{ms} - 12\text{ms} = 43\text{ms}$ --> rounded-off, the following is obtained $p10002 \leq 36\text{ms}$

Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.

Basic secondary condition to set the discrepancy time:

The discrepancy time of the FDIs must always be set higher than the highest value p9780 (the drives that use safety with TM54F).

Cause:	An internal software error has occurred in the Terminal Module 54F (TM54F). The fail-safe digital inputs and digital outputs (F-DI, F-DO) on the TM54F have been set to the safe state. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. Note: F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output
Remedy:	Check that the firmware version of the TM54F matches the Control Unit's firmware version. The automatic firmware update must be activated in the project. Note: This signal will also appear, for example, in conjunction with fault F35013. In this case you should check all the parameters for the test stop on the TM54F (p10001, p10003, p10007, p10041, p10046, p10047). In this case, a POWER ON is required after the parameters have been corrected.

Cause:	The zero mark synchronization with the encoder to be emulated was interrupted. Alarm value (r2124, interpret decimal): 0: The encoder is not in the ready state (e.g. encoder parked) 1: An absolute encoder was connected. 2: The encoder r0479[0...2] interconnected via connector input: p4420 is already communicating with another TM41 (precisely one TM41 can be interconnected with a specific r0479[0...2]). 3: The BICO interconnection to Terminal Module 41 (TM41) was removed (CI: p4420 = 0 signal). 4: The encoder interconnected via connector input: p4420 has carried out an EDS changeover or has been re-parameterized (this operation is not supported, set p4420 to 0 and interconnect again). 5: The maximum number of revolutions of the encoder was exceeded. 6: Encoder in an invalid state. 7: Encoder in an invalid state. 8: Encoder in an invalid state (the encoder is not parameterized or the interconnected signal source is not in the cyclic state).
Remedy:	Not necessary. - if the encoder changes into the ready state, then a synchronization operation that was previously interrupted is carried out again. - if the synchronization was interrupted due to the maximum permissible synchronization duration, then a new synchronization is not carried out. - The alarm is only output, if, for an absolute encoder, the zero mark synchronization is set to the zero position (p4401.0 = 1 and p4401.1=0).

Reaction:	NONE
Acknowledge:	NONE
Cause:	There is no frequency setpoint for the Terminal Module 41 (TM41). The output of tracks A/B has been held (frozen). Possible causes: - Connector input p4420 is not interconnected. - the leading encoder is not in the "ready" state (parking encoder or encoder data set not parameterized). - TM41 has a fault. - The TM41 is in the commissioning mode (p0010 > 0). - The TM41 component is not connected to DRIVE-CLiQ.
Remedy:	- Appropriately interconnect connector input p4420. - Bring the leading encoder into the "ready" state. - Remove any TM41 faults.

Reaction:	NONE
Acknowledge:	NONE
Cause:	Terminal Module 41 (TM41) does not support the following application cases: - the encoder interconnected via connector input p4420 has carried out an EDS changeover. - the encoder interconnected with the TM41 was re-parameterized so that the position actual value of the encoder must be newly interpreted. For example, this is the case when changing the direction of rotation of the motor (p0410, p1821) or when changing the fine resolution (p0418). This may result in a sudden change in the position actual value of the encoder (position setpoint of the TM41), which must not be output at the TM41. See also: p4420 (TM41 encoder emulation position setpoint)
Remedy:	Set connector input p4420 = 0 and re-wire.

Cause:	The sampling time set in p4099[3] for incremental encoder emulation in Terminal Module 41 (TM41) does not correspond to the valid value. To resolve the problem, correct the setting of p4099[3]. The system automatically performs a warm restart/sub-boot. Alarm value (r2124, interpret decimal): 1: A sampling time p4099[3] < 125 µs was set. 2: An integer multiple of the DRIVE-CLiQ clock cycle was not entered in p4099[3]. 3: - In the SINAMICS mode (p4400 = 1), the sampling time in p4099[3] is not an integer multiple of the current controller sampling time (p0115[0]) of the drive object, which supplies the position setpoint (CI: p4420) for the incremental encoder simulation. - The encoder interconnected via connector input p4420 (e.g. an SSI encoder) is sampled in a slower clock cycle.
Remedy:	- if necessary, cancel the BICO interconnection via connector input p4420. - check the rules specified under cause for setting the sampling time in p4099[3]. - if necessary, set the BICO interconnection via connector input p4420 again. Note: Every time the BICO interconnection is reset via connector input p4420, the sampling time is checked in p4099[3] and, where necessary, this message is output.

Cause:	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted. Remedy:	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). - check the setting of parameter p2037.

Cause:	SINAMICS (p4400 = 1) operating mode: When parameterizing a Terminal Module 41 (TM41) or when operating a TM41 Module, an operating state was reached which required a POWER ON. These include: - changing the encoder pulse number (p0408). - changing the fine resolution (p0418). - withdrawing the DRIVE-CLiQ cable without first de-activating TM41 via p0105. If this alarm was output, then the zero mark of the TM41 can no longer be output in synchronism to that of the encoder interconnected at p4420. SIMOTION (p4400 = 0) operating mode: A previously set zero mark position (p4426) no longer matches encoder position (r0479) due to the change in the pulse number (p0408).
Remedy:	The incremental position at output X520 of TM41 can still be evaluated independent of the zero mark. A POWER ON must be carried out if the TM41 zero mark is evaluated.

Cause:	The temperature (r4105[5]) measured using the temperature sensing of the Terminal Module 150 (TM150) has exceeded the threshold value to initiate this alarm (p4102[10]). Note: For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[5] = 1, 4), the following applies: - if r4101[5] > 1650 ohms, the temperature r4105[5] = 250 °C - if r4101[5] <= 1650 ohms, the temperature r4105[5] = -50 °C Alarm value (r2124, interpret decimal): Temperature actual value at the time of initiation [0.1 °C].
Remedy:	Allow the temperature sensor to cool down to below p4102[10] - hysteresis (p4118[5]). See also: p4102

Cause: A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit.
 Fault cause:
 1 (= 01 hex):
 Checksum error (CRC error).
 2 (= 02 hex):
 Telegram is shorter than specified in the length byte or in the receive list.
 3 (= 03 hex):
 Telegram is longer than specified in the length byte or in the receive list.
 4 (= 04 hex):
 The length of the receive telegram does not match the receive list.
 5 (= 05 hex):
 The type of the receive telegram does not match the receive list.
 6 (= 06 hex):
 The address of the power unit in the telegram and in the receive list do not match.
 9 (= 09 hex):
 The error bit in the receive telegram is set.
 16 (= 10 hex):
 The receive telegram is too early.
 17 (= 11 hex):
 CRC error and the receive telegram is too early.
 18 (= 12 hex):
 The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early.
 19 (= 13 hex):
 The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early.
 20 (= 14 hex):
 The length of the receive telegram does not match the receive list and the receive telegram is too early.

21 (= 15 hex):

The type of the receive telegram does not match the receive list and the receive telegram is too early.

22 (= 16 hex):

The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early.

25 (= 19 hex):

The error bit in the receive telegram is set and the receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (power off/on).
 - check the electrical cabinet design and cable routing for EMC compliance
 - check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

F35875 TM DRIVE-CLiQ (CU): Supply voltage failed

Message value: Component number: %1, fault cause: %2

Message class: Supply voltage fault (undervoltage) (3)

Drive object: A_INF, B_INF, CU_LINK, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF1 (OFF2)

Acknowledge: IMMEDIATELY

Cause: The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

Fault cause:

9 (= 09 hex):

The power supply voltage for the components has failed.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (power off/on).
- check the power supply voltage wiring for the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the power supply for the DRIVE-CLiQ component.

F35885 TM DRIVE-CLiQ (CU): Cyclic data transfer error

Message value: Component number: %1, fault cause: %2

Message class: Internal (DRIVE-CLiQ) communication error (12)

Reaction: OFF1 (OFF2)

Acknowledge: IMMEDIATELY

Cause: A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit.

The nodes do not send and receive in synchronism.

Fault cause:

26 (= 1A hex):

Sign-of-life bit in the receive telegram not set and the receive telegram is too early.

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

98 (= 62 hex):

Error at the transition to cyclic operation.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the power supply voltage of the component involved.
- carry out a POWER ON.
- replace the component involved.

Reaction:

OFF1 (OFF2)

Acknowledge:

IMMEDIATELY

Cause:

Fault detected on the DRIVE-CLiQ component (Terminal Module) involved. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

96 (= 60 hex):

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

Acknowledge:	IMMEDIATELY
Cause:	The properties of the DRIVE-CLiQ component (Terminal Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
Remedy:	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

OFF2

Acknowledge:

IMMEDIATELY

Cause:

The feedback signal of the ON command of the cooling unit is missing.

- after the ON command, the feedback signal has not been received within the selected starting time (p0260).

- the feedback signal has failed in operation.

See also: p0260 (Cooling unit starting time 1), r0267 (Cooling unit status word)

Remedy:

- check the wiring between the cooling unit and the input terminal (Terminal Module).

- check the external control device for the cooling unit.

A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

OFF2

Acknowledge:

IMMEDIATELY

Cause:

The drive converter cooling unit signals that the cooling liquid flow is too low.

- after the ON command, the feedback signal has not been received within the selected starting time (p0260).

- in operation, the feedback signal has failed for longer than the permitted failure time (p0263).

See also: p0260 (Cooling unit starting time 1), p0263 (Cooling unit fault liquid flow delay time), r0267 (Cooling unit status word)

Remedy:

- check the wiring between the cooling unit and the input terminal (Terminal Module).

F49154 (A) Cooling unit: Liquid leak is present

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The liquid leakage monitoring function has responded.
Caution:
If this fault is re-parameterized as an alarm then using other monitoring functions it must be ensured that when cooling water is lost, the drive is powered down!
See also: r0267 (Cooling unit status word)
Remedy:
- check the cooling system for leaks in the cooling circuit.
- check the wiring of the input terminal (Terminal Module) used to monitor leaking fluid.

Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: POWER ON
Cause: The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.
Remedy: Upgrade the firmware. Check EEPROM data.

F49156 Cooling unit: Cooling liquid temperature has exceeded the fault threshold

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The cooling liquid intake temperature has exceeded the specified fault threshold.
Note:
The value for the fault threshold depends on the power unit (hardware descriptive data, e.g. 52 ... 55 °C).
Remedy: Check the cooling system and the ambient conditions.

Message value:	%1
Message class:	General drive fault (19)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The excitation sequence control signals a fault. Fault value (r0949, interpret hexadecimal): Bit 0: When powered down or when powering down the excitation, the signal "excitation ready feedback signal" was not received within the monitoring time.

Bit 1:

After an ON command, the signal "excitation ready feedback signal" was not received within the monitoring time.

Bit 2:

After the pulses were enabled, the signal "excitation operational feedback signal" was not received within the monitoring time.

Bit 3:

The "excitation group signal fault" signal is present.

Bit 4:

The switch-on command for the excitation was reset, although pulse enable (r0899.11) is still available, or the excitation current actual value has still not fallen below a minimum value.

Note: message can also come from p6500[59].

Remedy:

- check the excitation.
- check commands, feedback signals and BICO interconnections.
- re bit 4: increase the switch-off delay time p1647

A.2 List of abbreviations

Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

Abbreviation	Source of abbreviation	Meaning
A		
A...	Alarm	Alarm
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog-digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American standard code for information interchange
AS-i	AS-Interface (Actuator Sensor Interface)	AS-interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
B		
BB	Betriebsbedingung	Operating condition
BERO	-	Proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
C		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	Communication Board PROFINET (Ethernet)
CD	Compact Disk	Compact disk
CDS	Command Data Set	Command data set
CF card	CompactFlash card	CompactFlash card
CI	Connector Input	Connector input

Abbreviation	Source of abbreviation	Meaning
CLC	Clearance Control	Clearance control
CNC	Computer Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output

DAC	Digital Analog Converter	Digital-analog converter
DC	Direct Current	Direct current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input / Digital Output	Bidirectional digital input/output
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed peripherals
DPRAM	Dual Ported Random Access Memory	Dual-port random access memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic random access memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DTC	Digital Time Clock	Timer
E		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder data set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory

Abbreviation	Source of abbreviation	Meaning
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatic sensitive devices
ELCB	Earth Leakage Circuit-Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Enable pulses
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Electrostatic sensitive devices
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
F		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function control chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Fail-safe Digital Input	Fail-safe digital input
F-DO	Fail-safe Digital Output	Fail-safe digital output
FEM	Fremderregter Synchronmotor	Separately excited synchronous motor
FEPROM	Flash EPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Residual current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field programmable gate array
FW	Firmware	Firmware
G		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)
GSD	Generic Station Description	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally unique identifier

Abbreviation	Source of abbreviation	Meaning
H		
HF	High Frequency	High frequency
HFD	Hochfrequenzdrossel	High-frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear drive
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human machine interface
HTL	High-Threshold Logic	Logic with high fault threshold
HW	Hardware	Hardware
I		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Commissioning
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Bipolar transistor with insulated control electrode
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
J		
JOG	Jogging	Jogging
K		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY	-	Special temperature sensor
L		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light-emitting diode
LIN	Linear motor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter

Abbreviation	Source of abbreviation	Meaning
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cables
M		
M	-	Symbol for torque
M	Mass	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
N		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization body in the US
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory
O		
OA	Open Architecture	Software component (technology package) which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware from which the OA-application can be used
OASP	Open Architecture Support Package	Expands the STARTER commissioning tool by the corresponding OA-application
OC	Operating Condition	Operating condition
OEM	Original Equipment Manufacturer	Original equipment manufacturer

Abbreviation	Source of abbreviation	Meaning
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
P		
p...	-	Setting parameters
P1	Processor 1	CPU 1
P2	Processor 2	CPU 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDS	Power unit Data Set	Power unit data set
PE	Protective Earth	Protective ground
PELV	Protective Extra-Low Voltage	Safety extra-low voltage
PEM	Permanentmagnet Synchronmotor	Permanent-magnet synchronous motor
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
Q		
R		
r ...	-	Display parameters (read only)
RAM	Random Access Memory	Read/write memory
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module

Abbreviation	Source of abbreviation	Meaning
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive process data object
RS 232	Recommended Standard 232	Interface standard for cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known as EIA485)
RTC	Real-Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space vector approximation
S		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SD Card	SecureDigital Card	Secure digital memory card
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switches
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe standstill
SI	Safety Integrated	Safety Integrated
SIL	Safety Integrity Level	Safety integrity level
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Vector control without encoder
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel

Abbreviation	Source of abbreviation	Meaning
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable Logic Controller
SS1	Safe Stop 1	Safe stop 1 (monitored for time and ramp)
SS2	Safe Stop 2	Safe stop 2
SSI	Synchronous Serial Interface	Synchronous serial interface
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
T		
TB	Terminal Board	Terminal Board
TIA	Totally Integrated Automation	Totally Integrated Automation
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral-action time
TPDO	Transmit Process Data Object	Transmit process data object
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor Logic	Transistor-transistor logic
Tv	-	Derivative action time
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
V		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage, negative
VdcP	-	Partial DC-link voltage, positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak-to-peak
VSM	Voltage Sensing Module	Voltage Sensing Module
W		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
X		
XML	Extensible Markup Language	Extensible Markup Language (standard language for Web publishing and document management)

Abbreviation	Source of abbreviation	Meaning
Y		
Z		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
SW	Zustandswort	Status word
